But while the drainage canal covers about half of the work involved in the project by way of Chicago River, it at the same time has turned an additional flow into the Des Plaines River, materially changing its low-water regimen. The requirement of this flow at present are 5,000 cubic feet per second, while the limit of 10,000 is probably more nearly the flow that will have to be dealt with, at least not long after the completion of the present project. As nearly as can now be estimated, this flow gives a water line indicated on the accompanying profile, and the contrast is shown with the low-water conditions hitherto existing. The steep slope shown on the profile indicates that with so large a volume of discharge the velocity of the current would be too great for up-stream navigation in an open river. This might be overcome to a great extent by canalizing the river by high dams, entailing great expenditures for the necessary works, as well as for the purchase of lands overflowed, the cost of which cannot even be approximated from present information."

November 17, 1900, the Board of Engineers made a report pursuant to the Rivers and Harbors Act of March 3, 1899, H. R., Document No. 112, 56th Congress, 2nd Session, Vol. 4, p. 2190. The report is in part as follows:

"The Board finds the most economic route for waterways of 7 feet and 8 feet depth to be from Utica to Marseilles in the bed of the river, 11.4 miles; thence around

the Marseilles rapids by canal, 7.4 miles; thence in the bed of the river to near the mouth of Kankakee River, 21.2 miles; thence by enlarging the Illinois and Michigan Canal to the Joliet basin, 18.3 miles; thence by canal through Joliet Basin and along the east bank of the Des Plaines River, 4½ miles, connecting with the Sanitary Canal at Lockport and thence through the Sanitary Canal
2191 and the Chicago River to Lake Michigan, thus complying with the terms of the Act of March 3rd, 1899. • • • •

2192 As in the preliminary report, the Board invites attention to the fact that the estimates are based upon the assumption that the State of Illinois and the sanitary
2193 trustees of the City of Chicago will cede the necessary parts of their respective franchises free of cost to the United States, both for construction and use.

The Sag Route

Since the Board's report of March 17, 1900, the trustees of the sanitary district have undertaken to cooperate with the United States in deepening the South Branch of Chicago river to 21 feet and widening it to at least 200 feet. They have already planned to substitute 7 bascule bridges for the center-pier bridges now obstructing the river. It is expected that this project will be extended, and that the City of Chicago will undertake a part of the bridge reconstruction and lower, or cause to be lowered, the three tunnels now limiting the navigable depth of the river to 17 feet. The fears entertained with respect to the dangers of navigating the South Branch of the river under the new conditions of reversed flow have been allayed to a great degree by the practical experience of the past season. For this reason, and because the plans for both the 7-foot and 8-foot waterways comply with the requirements of the act contained in the words "with a view to the extension of navigation from the Illinois river to Lake Michigan at or near Chicago" in connection with the Sanitary Canal, the Board is of the opinion that the additional cost will not justify the construction at the present time of an auxiliary canal from the Sanitary Canal to Lake Michigan by way of the Sag and Calumet Route, and is also of the opinion that such a route would not become a necessity until commerce of either 7-foot or 8-foot route should develop to a degree not expected for years."

Pursuant to the Rivers & Harbors Act of June 6, 1900, the Board of Engineers appointed under said Act, made a report dated November 18, 1900, in part as follows: (Vol. 4, p. 2197.)

"The project for the Lower Illinois river provides for locks 75 feet wide and 350 feet between miter sills with 7 feet on the miter sills at low water. The discharge
2198 of the Chicago Drainage Canal should increase the navigable depth to over 8 feet, and if the project be extended to Lake Michigan by the 8 foot project on which estimates have been submitted by the Board, there will be afforded a connecting link between the Great Lakes and the rivers of the Mississippi valley, not only ample for river navigation as it now exists, but also for any improvement therein that has been authorized by Congress.

But it is held by not a few that the United States should take the initiative and construct a great waterway of which the Illinois Valley line should be a link, extending lake navigation to the interior of the country, and that a commerce which does not now exist will then develop to such a magnitude as will more than justify the expenditures. For such a project a depth of 14 feet or greater will be required, and further surveys and estimates for a waterway of less depth than 14 feet cannot be considered by the terms of Section 22, under which the Board is instructed to act.

The engineering questions presented in a project for a deep waterway to connect Lake Michigan with the Illinois river, although attended with considerable difficulty, are by no means insuperable. The proposed line would embrace, first, the Chicago river, consisting of the main river and a portion of the South Branch for a distance of about 5 miles. This section is now under improvement by the United States in cooperation with the trustees of the Sanitary District of Chicago, and will, when the many changes in bridges and tunnels have been made, and the widening and deepening of the channel completed, afford a navigable depth of 21 feet and an available width of 200 feet.

Connecting with this section the sanitary canal affords a magnificent waterway, 28 miles in length, of sufficient depth and width for any possible requirement of navigation.

From the west end of this canal the waters of Lake Michigan, in a steady flow amounting to from 5,000 to 10,000 cubic feet per second, are discharged into the bed of the Des Plaines river, and are carried thence down through the Illinois to the Mississippi.

The velocity of current along the Des Plaines river, which would have resulted from confining this discharge to a channel of 8 feet depth for barge navigation, will be sufficiently reduced in a ship canal of 14 feet depth *or over to make up-stream navigation feasible.* On the lower Illinois river the prevailing slope of less than 0.15 foot
2199 per mile will insure so gentle a current that the depth required can be secured simply by enlarging the existing waterway by dredging in an alluvial deposit, at a cost which will be small when compared with the work which has been done by the City of Chicago in cutting through the divide between the Lake Basin and the Illinois Valley watershed,, so eloquently described in the memoir of the Board of Trustees of the Sanitary District of Chicago.

But such a channel to be of commercial value should either form a through line of communication between the lakes and the Gulf of Mexico or extend to some large center of population, as St. Louis. A waterway stopping at the Village of Grafton would have little commercial importance, except locally over one to the present terminus of the Drainage Canal at Lockport. The terminal arbitrary described by Mr. Cooley in his paper submitted will be as applicable in the one case as in the other.

The commercial possibilities of navigation by lake vessels to St. Louis and the Gulf of Mexico have been ably discussed in the papers accompanying this report, but all of these projects are based upon the assumption that the Mississippi river can be rendered navigable for such vessels. The feasibility of the development of the navigation of the Mississippi river is the essential element, which must first be determined before any project for extending lake navigation inland can be considered advisable."

Major Willard, U. S. Engineer at Chicago in 1901, pursuant to the Rivers and Harbors Act of July 3, 1896, made a report to the Chief of Engineers, which is found in the Chief of Engineers' Report 1901, p. 3006. (Rec. Vol. IV, p. 2187).

"The State laws authorizing the construction of the
2188 Sanitary Canal require removal of the state dams, when the flow required by the state law of 20,000 cubic feet per minute for each 100,000 inhabitants of the Sanitary District shall have become permanent, the expectation being that the increased discharge would furnish an open navigation equivalent to that pooled by the dams. The discharge of the sanitary canal, however, is regulated by the Secretary of War *insofar as it affects the interests of navigation in the Chicago River,* and has been reduced by his order to 200,000 cubic feet per minute until the South Branch shall have been widened and deepened sufficiently to permit the full flow required by the State law, or so much thereof as may be found safe."

In 1902 Col. O. H. Ernst, United States Engineer at Chicago, made a report to the Chief of Engineers, Report of Chief Engineers, 1902. App. K. K., p. 2097. (Rec. Vol. IV, p. 2200.)

"Since the flow of the Chicago River has been reversed through the South Branch by the discharge into the sanitary canal the slope has also been reversed from the lake upstream and the depth correspondently reduced. This loss in navigable depth will be more than restored in the main stream and in the South Branch by the excavations of the sanitary district, which, in order to facilitate the flow of the large volume of water required for the dilution of the sewage discharged into the drainage canal, has undertaken to enlarge these portions of the Chicago River to a width of 200 feet and central depth of 26 feet. These dimensions have no relation to the draft of vessels using the river, and if maintained as they should be for drainage purposes will furnish a navigable depth in excess of the requirements. The south fork of of the South Branch, and the North Fork, however, do not share in these benefits. In the South Fork particularly the dimensions of channel obtained by the operations of the Government were seriously impaired by the change of slope. The sanitary district has undertaken to restore these dimensions, and will no doubt do so, though it has been prevented from fully accomplishing the work by some difficult rock excavation. But it has not undertaken as yet to maintain them.

The Chicago River is the main sewer of Chicago, and as such is subject to deteriorating influences as a navigable channel from which there is no escape. The city ordinances against dumping solid matter into it are ample, and, I think, generally well observed. But a very large amount of solid matter must of necessity go into it with a perfectly legitimate use of it as a sewer. Periodical dredging will be necessary to maintain it as a navigable channel and, eventually, to maintain it even as a sewer. That work would seem to be as much the duty of the city as the maintenance of any other part of its sewer system. So far as the South Branch is concerned, the question has been solved by the necessities of the drainage canal, as already mentioned, but the sanitary district has not accepted responsibility for maintaining the other branches. Whether that organization or some other representing the people of Chicago should do the work is for them to decide, but it seems to me clear that the United States should not be called upon to do it. Accordingly, no estimate for maintaining the channel excavated under the project of 1896 is submitted."

In the Rivers and Harbors Act of June 13, 1902, an appropriation was made of $200,000 by Congress for the survey of a waterway 14 feet in depth from the terminus of the Sanitary District canal to St. Louis, Mo. The report of the commission was transmitted December 18, 1905, by Wm. Howard Taft, Secretary of War, said Document is known as H. R. Document 263, 59th Congress, 1st Session. (Rec. Vol. IV, pp. 2261-2269.)

In a letter from the Chief of Engineers to the Secretary of War, the Chief of Engineers said (Rec. Vol. IV, p. 2262):

"Washington, December 12, 1905.

Sir: The river and harbor act approved June 13, 1902, contained an item as follows:

The sum of two hundred thousand dollars, or so much thereof as may be necessary, is hereby appropriated for making such surveys, examinations, and investigations as may be required to determine the feasibility of, and to prepare and report plans and estimates of cost, of a navigable waterway fourteen feet in depth from Lockport, Illinois, by way of the Des Plaines and Illinois rivers to

the mouth of said Illinois River, and from the mouth of the Illinois River, by way of the Mississippi River, to Saint Louis, Missouri: *Provided*, That twenty-five thousaid dollars of said sum, or so much thereof as may be necessary, may be expended by the Mississippi River Commission in making surveys, examinations, and investigations herein required from the mouth of the Illinois River to Saint Louis *provided further* that the Secretary of War shall appoint a board of three engineers to make the surveys, examinations and investigations hereinbefore required from Lockport, Illinois, through the Des Plaines River and Illinois River, to the mouth of said Illinois River, and that all such surveys, examinations, and investigations shall be made to determine the feasibility of, and to prepare and report plans and estimates of cost of, a navigable waterway fourteen feet in depth from
2264 Lockport, Illinois, to Saint Louis, Missouri.

* * *

The Board estimates the cost of the channel from Lockport to Grafton at $23,543,582. This estimate is based on concrete locks 600 feet long, 80 feet wide, and 14 feet deep over the miter sills. The Board remarks that this depth while corresponding to the channel mentioned in the act, will not provide for any future increase, which may be made possible by argumenting the flow through the Chicago Drainage Canal above 10,000 cubic feet per second. The Board states that, to take full advantage of such possible increase in navigable depth, the locks would have to be entirely rebuilt, or would have to have increased depths given to them at the present time. To increase the depth over the miter sills 6 feet now would add about $1,376,000 to the cost of the project. The plan proposed is based upon the assumption that the abstraction of 10,000 cubic feet of water per second from Lake Michigan, a quantity contemplated in the State legislation affecting the drainage canal, will eventually be permitted by competent Federal authority.

In this connection the Board states that it does not condemn the present plan of taking 10,000 cubic feet per second, believing as it does that some such amount will be needed to protect the lives and health of the people of a great city and of a populous valley; but it invites attention to the fact that if a much larger amount be taken it will be necessary to construct remedial works elsewhere, and that these are, or should be, of an international character. It is led to make this remark by the attitude of the Illinois legislature and of the other principal advocates

of this enterprise, which is that the 14-foot waterway is only a beginning, and that a much deeper channel ulti-
2265 mately should be constructed, which means that a much larger volume of water must be taken from Lake Michigan. It is the opinion of the Board that the sanitary reasons for the abstraction of water so far exceed and overshadow the commercial reasons that the amount should be strictly limited by the sanitary necessities of the case. It is impossible to fix a limit to the future growth of Chicago. In a future not remote larger amounts of water may be needed for sanitary purposes, and channels deeper than 14 feet will then become practicable in the open alluvial portion of the Illinois River.

* * *

Very respectfully,

A. MACKENZIE,

Brig. Gen., Chief of Engineers, U. S. Army.

Hon. WM H. TAFT,

Secretary of War."

In the report of the Commission itself, it is stated, (Rec. Vol. IV, p. 2265):

"Extract from the Report of the Board, Page 9, Entitled Chicago Drainage Canal.

Besides being a highway of commerce, the Illinois and Michigan Canal has from the beginning served to carry off the sewage of Chicago. The Chicago River has always been the main receptacle of the sewage of the city, and as the volume of sewage has increased with the growth of the city additional facilities for discharging it into the canal have become necessary. When the canal was opened in 1848, a pumping plant was established at Bridgeport, where it joins the Chicago River. In 1860 the capacity of this plant was nearly doubled, being increased to about 400 cubic feet per second. Later on the summit level of the canal was cut down so as to provide a continuous gravity flow from the Chicago River and Lake Michigan. That work was completed in 1871 and the pumping plant abandoned. In 1883 a new pumping plant was brought into use, having a nominal capacity of 750 cubic feet per second, but it soon became evident that the discharging capacity of the old canal was quite inadequate to carrying the volume of water required to dilute

the sewage and that a new and greatly enlarged channel
2266 must be provided. The Chicago Drainage Canal was then constructed and was brought into use in January, 1900. It has not yet been completed to its full capacity as designed. When fully completed it will have a capacity of about 10,000 cubic feet per second, flowing at a low velocity. As now constructed, it has a depth of about 22 feet and a bottom width in different parts 110 feet, 160 feet and 202 feet, respectively. It constitutes a navigable channel able to accommodate the largest vessels now navigating the Great Lakes. It extends from the Chicago River to Lockport, where it discharges into the Des Plaines River and is now being extended 2 miles farther to a new power house. With the six miles of the Chicago River and the two miles extension just mentioned it provides a wide and deep channel for a distance of 36 miles from Lake Michigan. At present it has no navigable connection with the streams below, but under State legislation a connection is to be made. It creates an important water power.

Although the primary object of the Chicago Drainage Canal was the discharge of Chicago sewage, its function as a channel, for navigation, was kept in view from the beginning. All of the bridges over it are draw bridges with ample openings. The original act of the Illinois legislature providing for its construction dated May 29, 1889, contained the following item, viz:

> 24. When such channel shall be completed, and the water turned therein, to the amount of three hundred thousand cubic feet of water per minute, the same is hereby declared a navigable stream, and whenever the General Government shall improve the Des Plaines and Illinois Rivers for navigation, to connect with this channel, said General Government shall have full control over the same for navigation purposes, but not to interfere with its control for sanitary or drainage purposes.

As its utility for sanitary or drainage purposes is dependent upon the supply of water which it may obtain from Lake Michigan, a matter wholly at the discretion of the Federal Government, the degree of control which the State offers to the United States in this act, although limited, is probably sufficient. It is conditioned, however, upon the improvement by the Federal Government of the Illinois and Des Plaines Rivers, and the degree

of improvement is described in Section 23 of the above mentioned State law, which contains the following language:

2267 If at any time the General Government shall improve the Des Plaines or Illinois Rivers, so that the same shall be capable of receiving a flow of 600,000 cubic feet of water per minute, or more, from said channel, and shall provide for the payment of all damages which any extra flow above 300,000 cubic feet of water per minute, from such channel may cause to private property, so as to save harmless the said district from all liability therefrom, then such sanitary district shall within one year thereafter enlarge the entire channel leading into said Des Plaines or Illinois Rivers from said district to a sufficient size and capacity to produce and maintain a continuous flow throughout the same of not less than 600,000 cubic feet per minute, with a current of not more than three miles per hour, and such channel shall be constructed upon such grade as to be capable of producing a depth of water not less than eighteen feet throughout said channel, and shall have a width of not less than one hundred and sixty feet at the bottom.

The taking of large quantities of water from Lake Michigan for drainage purposes has not been authorized by Congress. It has been the policy of the War Department thus far to regulate the quantity of water which is admitted to the canal by the necessities of navigation in the Chicago River. The capacity of that stream at present is such that not more than about 4,200 cubic feet per second can pass without creating velocities which will unreasonably obstruct navigation. The quantity of water admitted to the canal is, for the present, limited to that amount, or, as expressed in the permit of the Secretary of War, to 250,000 cubic feet per minute. This is less than is required by the State law. It will no doubt be increased as the obstructions in the Chicago River are removed, and its discharging capacity increased, a work upon which the Sanitary District is now engaged. In repairing its estimates the Board has assumed that the full discharge of 10,000 cubic feet per second contemplated in the plans of the Sanitary District will eventually be permitted by the Secretary of War.

2268 VESTED RIGHTS.

The effect upon the level of Lake Michigan of withdrawing 10,000 cubic feet per second for an indefinite period has been the subject of an elaborate investigation under the office of the Lake Survey in Detroit, and the conclusion reached is that the final effect will be to lower the level about 6 inches. (See Annual Report of Chief of Engineers for 1900, p. 5401, and for 1902, p. 2779 and p. 2825; also for 1904, p. 4120.) Oscillations of more than 6 inches in the level of the lake's surface are very common, often occurring hourly for many hours in succession, while oscillations of 2 or 3 feet within an hour are not uncommon. Still greater oscillations within a year or series of years occur, all from natural causes. Moreover, during a severe winter the discharge of St. Clair River is reduced by ice less than one-third its normal discharge, the remaining two-thirds being stored up in Lakes Huron-Michigan and raising their levels; and the difference between the total discharge during a severe winter and the discharge during a mild winter will probably equal, or nearly equal, the discharge of the Chicago Drainage Canal for a year. A permanent average lowering of 6 inches in the lake's level, therefore, is not easily observed and will probably not be noticed by navigators. Nevertheless the effect is real and important. Evidently there is a limit to the amount of water which can be taken from the southern end of Lake Michigan without compensating works at the outlet of Lake Huron. The Board does not condemn the present plan of taking 10,000 cubic feet per second, believing as it does that some such amount will be needed to protect the lives and health of the people of a great city and of a populous valley; but it invites attention to the fact that if a much larger amount be taken it will be necessary to construct remedial works elsewhere, and that these are, or should be, of an international character. It is led to make this remark by the attitude of the Illinois legislature and of the other principal advocates of this enterprise, which is that the 14 foot waterway is only a beginning, and that a much deeper channel ultimately should be constructed, which means that a much larger volume of water must be taken from Lake Michigan. It is the opinion of the Board that the
2269 sanitary reasons for the abstraction of water so far exceed and overshadow the commercial reasons that the amount should be strictly limited by the sanitary necessities of the case. It is impossible to fix a limit to the fu-

ture growth of Chicago. In a future not remote larger amounts of water may be needed for sanitary purposes, and channels deeper than 14 feet will then become practicable in the open alluvial portion of the Illinois River."

On May 22, 1906, Lieut. Col. Bixby, Division Engineer at Chicago, made a report on the effect of the withdrawal of water from Lake Michigan by the Sanitary District at Chicago which report was transmitted to Congress as House Document 6, 56th Congress, 1st Session. (Rec. Vol. IV, p. 2397A.)

"Extract From a Special Report by Lt. Col. W. H. Bixby, U. S. Engineer, at Chicago, Entitled 'Effect of Withdrawal of Water from Lake Michigan by the Sanitary District of Chicago,' Dated May 22, 1906.

(H. R. Doc. 6, 59th Cong., 1st Sess.)

* * *

Page 6.

Furthermore, by reason of winds and barometric effects, oscillations of 6 inches several times in a single day are frequent, and 2 to 4 feet within an hour are occasionally experienced. Consequently, individual exceptional levels are misleading, and the general effects of water diversions must be measured by annual average rather than by monthly or daily.

* * *

Page 7.

In the few cases where past troubles from currents have been real, they have been due to the contracted channel ways at bridges, tunnels, and other special points,
2397B where full dimensions of water flow have already been secured or are being secured by the drainage district improvements, or will soon be provided by tunnel owners.

These troubles in the past have been quite freely and fully commented upon or reported upon by the boat interests and by this office, the most important of such reports being those of the hearing before the honorable Secretary of War, May 16, 1900 (E. D. 35242/7), that of Major Willard, February 16, 1901 (with third indorsement on E. D. 35242/26), that of Major Willard, June 20, 1900 (E. D. 35242/(?)), that of Major Willard, March 29, 1901 (with third indorsement on E. D. 35242/40), and that of Colonel Ernst, November 5, 1901 (which led to permit E. D. 35242/74, quoted above). These reports show that the greatest velocity heretofore actually observed at

any single point of the worst old bridge draw opening (that of Canal street, now greatly improved), was 2.24 miles per hour (3.29 feet per second), while the average for a whole cross section at this draw was only about 1.8 miles per hour (2.6 feet per second), and the average for a full 200-foot width of river just above and below the bridge would not have been over 1.2 miles per hour (1.8 feet per second); and that even a large part of this was probably due to sudden changes of lake levels for which the drainage district was not responsible. These currents, although much complained of at the time, are not greater than are constantly encountered in many tidal rivers on the Atlantic coast, where no complaints are made, because all boat captains and pilots are accustomed to such currents and make their arrangements accordingly.

• • •

Page 8.

17. In the capacity of sewer to properly carry off all the diluted sewage which the sanitary district must dispose of in the future, the South Branch and West Fork of Chicago River and the district drainage canal will need the use of the full cross section now being given to them at their typical points of constriction, viz., 4,700 square feet in South Branch, Chicago River, where a future 8,000 cubic feet per second is now asked for; 5,200 square feet in West Fork, South Branch, Chicago River, 5,412 square feet in the earth sections and 3,542 square feet in the rock sections of the drainage canal, for all of which 10,000 cubic feet per second is now asked for; and 5,412 square feet in the lower (south) end of the drainage canal, where 14,000 cubic feet per second is now being asked for. I assume that after this volume of water reaches the
2397C Des Plaines and Illinois rivers it can be taken care of more easily than in the Chicago River and that the 2,800 square feet cross section of the proposed 14-foot waterway, now under consideration by Congress, will be supplemented sufficiently by the rest of the natural river on each side of the improved boat channel. The above cross-sections, so long as no boats lie at wharves or pass up and down the river, will allow the passage of the 8,000 cubic feet per second through the South Branch, with average velocities of not exceeding about 1.2 miles per hour (1.7 linear feet per second); 10,000 cubic feet through the West Fork, with average velocities of not exceeding about 1.3 miles per hour (1.9 linear feet per second), and the same flow through the earth sections of canal at not ex-

ceeding 1.2 miles per hour (1.8 linear feet per second), and through the rock section of canal at not exceeding 1.9 miles per hour (2.8 linear feet per second); and 14,000 cubic feet through the lower end of canal at not exceeding 1.8 miles per hour (2.6 linear feet per second).

Wherever the full free cross section of the river is obstructed by bridge abutments or by boats, either at docks or passing, the average 8,000 to 10,000 cubic feet per second water flow must pass through the reduced cross section at increased speed. The full development of this increase, while not instantaneous, will require only a few moments. In this manner, at bridges, the velocities will be increased for a short length by about 30 per cent; at places where two boats of 40 to 50 feet beam and 800 square feet wetted cross section are abreast the increase of velocity will be about 50 per cent; at places where three such boats are abreast the increase will be about 100 per cent; and in case four such boats should be abreast (one tied at the wharf on each side of the stream and two others trying to pass in mid-river), the increase will be about 200 per cent. The drainage currents in the South Fork, South Branch, due to the 2,000 cubic feet per second coming from the Thirty-ninth street pumping station, and in the North Branch, due to a similar pumpage probably soon to be established at some street near Evanston, in the north end of Chicago, will be only about one-half of those in the South Branch, and their effects will probably be so small as not to be complained of by navigation interests. The drainage currents in the canal prop-
2397D er between the West Fork and Lockport will be about the same as in the South Branch; but as this part of the canal was not originally a public waterway and has not yet been accepted as such by the Federal Government, it is doubtful whether the United States can object to any current which its owners may establish or desire to establish therein. It is therefore evident that so long as the Chicago River serves merely as a sewer and is not to be used by boats the drainage district currents will not be objectionable, but soon as it is also used as a harbor or as a canal or water route the currents begin to be seriously questionable.

* * *

Page 12.

25. Summing up the above it may be briefly stated, therefore that 10,000 cubic feet per second diversion of water from Lake Michigan into the drainage canal will be, probably, not unreasonably obstructive to navigation and

injuries to property if divided up into 6,000 cubic feet per second through the main river and south branch, increased by 2,000 cubic feet per second more through the Thirty-ninth street sewer and 2,000 cubic feet per second more through Calumet River (10,000 cubic feet per second in all), but that an increase in these amounts to 8,000, 2,000, and 4,000 cubic feet, respectively (14,000 cubic feet per second in all), will probably prove to be unreasonably obstructive and injurious. Also that the 10,000 cubic feet per second will eventually and permanently lower the levels of Lakes Michigan and Huron by about 0.5 foot and Lake Erie by about 0.4 foot, and 14,000 cubic foot per second will make these depths 0.7 and 0.6 foot, respectively, which will be quite costly in future results."

On the fourth day of January, 1907, the International Waterways Commission made a report to the United States and to Canada which is as follows:

Senate Doc. 959, 62nd Congress, 3rd Session, p. 21. (Rec. Vol. IV, pp. 2409-2433.)

"Extract Entitled Appendix I Attached to the International Waterways Commission Progress Report Above Mentioned.
Page 67.

Report Upon the Chicago Drainage Canal by the Commission, January 4, 1907.

International Waterways Commission,
Toronto, Ontario, January 4, 1907.

The Honorable Secretary of War of the United States and the Honorable Minister of Public Works of Canada:

The International Waterways Commission has the honor to submit the following report upon the Chicago Drainage Canal:

1. The headwaters of the Illinois River, an important tributary of the Mississippi, approach within 10 miles of Lake Michigan near its southerly end, where stands Chicago. The river, called here the Des Plaines, is separated from the lake by a low and narrow divide running nearly north and south. In the divide are two depressions, about 8 miles apart, in which the height is only about 10

feet above the surface of the lake. The area eastward of the divide is drained by two streams, the Chicago and the Calumet Rivers, which empty into Lake Michigan.

The City of Chicago was originally built on the Chicago River, and, although it is now spreading into the Calumet region, it was for many years drained exclusively by the Chicago River, and its principal parts are now so drained. This river constitutes the main sewer of Chicago. The lake furnishes the city's water supply. To prevent the pollution of the water supply by sewage has always been the most important municipal problem with which Chicago has had to deal. Its solution has from a very early day been found in diverting a part of the river's flow into the valley of the Des Plaines through the most northerly of the two depressions mentioned above. The Illinois and Michigan canal, which was
2410 opened to navigation in 1848, was at once utilized for this purpose, and all subsequent improvements consisted in efforts to force more sewage through that canal until, in 1889, it was decided to build a new and greatly enlarged channel which should completely divert the Chicago River from Lake Michigan and draw from that lake a body of pure water large enough to make the sewage inoffensive to the communities by whose doors it must pass.

2. Before embarking upon this work the city in 1886 appointed a commission of three engineers 'to consider and report on any and all things which relate to the matter of water supply and drainage of the City of Chicago.' In January, 1887, the commission submitted a report to the mayor and city council of Chicago (copy appended marked 1), which it styled a preliminary report. It intended to submit an additional or final report in which the data upon which its conclusions were based should be given in greater detail, but such additional report was never submitted. After remarking that 'almost every conceivable way of dealing with these questions had been suggested and in some form applied during the past thirty years,' the commission stated that 'among the possible methods of getting rid of the Chicago sewage there are but three that have been deemed worthy of consideration, namely, a discharge into Lake Michigan, a disposal upon land, and a discharge into the main river.' It considered the first method too expensive, involving as it does a wide separation between the outlets of the sewers and the intakes of the water supply. It pronounced the second inapplicable to the metropolitan district as a whole, under the topographical conditions ex-

isting, but thought that it might be employed for the extreme northern and southern parts, the latter including the Calumet region. It recommended the third method. It was uncertain as to the quantity of water required to dilute the sewage so as to make it inoffensive, but in order to prepare an estimate of cost it was compelled to assume some approximate size of channel, and it did assume a size large enough to discharge 600,000 cubic feet per minute, that being the estimated amount of water falling upon the area tributary to the Canal during storms and not otherwise disposed of. It includes the drainage basis of the upper Des Plaines and of the Chicago rivers, but not that of the Calumet River. With a channel of less dimensions in times of storms and floods the Chicago
2411 River would not be fully diverted into the Des Plaines, but would back up into Lake Michigan. The result was a supply of 24,000 cubic feet per minute for each 100,000 people in a population of 2,500,000, the population which the commission thought it desirable to provide for, and the opinion was expressed that this would equal the maximum requirements.

3. Following this report the Illinois Legislature passed an act approved May 29, 1889, 'to create a sanitary district and to remove obstructions in the Des Plaines and Illinois Rivers,' of which the twenty-third and twenty-fourth paragraphs read as follows, viz:

'Paragraph 23. If any channel is constructed under the provisions hereof by means of which any of the waters of Lake Michigan shall be caused to pass into the Des Plaines or Illinois Rivers, such channel shall be constructed of sufficient size and capacity to produce and maintain at all times a continuous flow of not less than 300,000 cubic feet of water per minute, and to be of a depth of not less than 14 feet, and a current not exceeding 3 miles per hour, and if any portion of any such channel shall be cut through a territory with a rocky stratum where such rock stratum is above a grade sufficient to produce a depth of water from Lake Michigan of not less than 18 feet, such portion of said channel shall have double the flowing capacity above provided for, and a width of not less than 160 feet at the bottom capable of producing a depth of not less than 18 feet of water. If the population of the district draining into such channel shall at any time exceed 1,500,000, such channel shall be made and kept of such size and in such condition that it will produce and maintain at all times a continuous flow of not less than 20,000 cubic feet of water per min-

ute for each 100,000 of the population of such district, at a current of not more than 3 miles per hour, and if at any time the General Government shall improve the Des Plaines or Illinois Rivers, so that the same shall be capable of receiving a flow of 600,000 cubic feet of water per minute, or more, from said channel, and shall provide for the payment of all damages which any extra flow above 300,000 cubic feet of water per minute from such channel may cause to private property so as to save harmless the said district from all liability therefrom, then such sanitary district shall, within one year thereafter, enlarge the entire channel leading into said Des
2412 Plaines or Illinois Rivers from said district to a sufficient size and capacity to produce and maintain a continuous flow throughout the same of not less than 600,000 cubic feet of water per minute, with a current of not more than 3 miles per hour, and such channel shall be constructed upon such grade as to be capable of producing a depth of water of not less than 18 feet throughout said channel, and shall have a width of not less than 160 feet at the bottom. In case a channel is constructed in the Des Plaines River, as contemplated in this section, it shall be carried down the slope between Lockport and Joliet to the pool, commonly known as the upper basin, of sufficient width and depth to carry off the water the channel shall bring down from above. The district constructing a channel to carry water from Lake Michigan of any amount authorized by this act may correct, modify and remove obstructions in the Des Plaines and Illinois Rivers wherever it shall be necessary so to do to prevent overflow or damage along said rivers, and shall remove the dams at Henry and Copperas Creek, in the Illinois River, before any water shall be turned into the said channel. And the canal commissioners, if they shall find at any time that an additional supply of water has been added to either of said rivers by any drainage district or districts, to maintain a depth of not less than 6 feet from any dam owned by the State to and into the first lock of the Illinois and Michigan Canal at La Salle, without the aid of any such dams, at low water, then it shall be the duty of said canal commissioners to cause such dam or dams to be removed. This act shall not be construed to authorize the injury or destruction of existing water-power rights.

'Paragraph 24. When such channel shall be completed and the water turned therein, to the amount of 300,000 cubic feet of water per minute, the same is hereby de-

clared a navigable stream, and whenever the General Government shall improve the Des Plaines and Illinois Rivers for navigation, to connect with this channel, said General Government shall have full control over the same for navigation purposes but not to interfere with its control for sanitary or drainage purposes.'

2413 By this act a flow of not less than 20,000 cubic feet per minute is required for each 100,000 inhabitants and provision is made for a population of 3,000,000. The evidence before the legislative committee which framed the bill as to the quantity required was contradictory. The amount fixed for dilution of the sewage was a minimum. (See Appendix I.)

4. Under this act the Sanitary District of Chicago was organized, embracing all of the city north of Eighty-seventh street and some 43 square miles of Cook County outside of the city limits. The total area of the district was 185 square miles and did not include the Calumet region nor the north shore. The trustees held their first meeting January 18, 1890. The Chicago Drainage Canal was then constructed, water being turned into it for the first time in January, 1900. It was not then, and has not since been, completed to its full capacity as designed. In some places where the excavation was in rock the full dimensions of the prism were taken out, but in earth a considerable volume was left to be removed by the easy method of dredging hereafter. When fully completed it was designed to have a capacity of 600,000 cubic feet per minute, or 10,000 cubic feet per second, flowing at a velocity of 1.25 miles per hour in earth and 1.9 miles per hours in rock.

5. The canal is 28.05 miles in length. For a distance of 7.8 miles from its junction with the Chicago River at Robey street its dimensions are 110 feet width at bottom, side slopes 1 on 2, depth of water 22 feet at low stage of Lake Michigan, with a grade of 1 in 40,000, the material being earth. This section is eventually to have a width of 200 feet at bottom.

6. For a farther distance of 5.3 miles, although the material is principally earth, the dimensions are 202 feet width at bottom, side slopes 1 on 2, minimum depth of water 22 feet, with a grade of 1 in 40,000. This section is completed.

7. For the remaining 15.95 miles the canal is excavated wholly or partially in rock. Where the natural rock does

not come to the surface walls of masonry have been built upon the rock surface, thus artificially carrying it to a height 5 feet above datum. The dimensions here are 160 feet width at bottom, 162 feet width at top, minimum depth of water 22 feet, with a grade of 1 in 20,000. This
2414 section also is completed.

8. The controlling works are situated near the town of Lockport at the western end of the canal. They consist of a bear-trap dam 160 feet wide, with a vertical play of 17 feet, and of seven sluice gates of the Stoney type, each 30 feet wide and having a vertical play of 20 feet. These works provide a very efficient means of controlling the flow of water through the canal.

9. The project of the sanitary district for the disposal of sewage by the canal when completed is briefly as follows: All sewers will discharge into the Chicago River, either directly or through intercepting sewers. From the mouth in Lake Michigan to the point where the North and South Branches unite the river will flow 8,000 cubic feet per second, less such quantity as may be pumped into the upper portion of the North Branch, which under the original project was 200 cubic feet per second admitted through a conduit at Fullerton avenue. From this point the combined flow will be 8,000 cubic feet to the point where the South Fork enters the South Branch, where it will be increased to 10,000 cubic feet by the water pumped from Lake Michigan at Thirty-ninth street and flowing through a large conduit in Thirty-ninth street to the South Fork. The volume which will finally enter the canal under this project will be 10,000 cubic feet per second.

10. The channel of the Chicago River is not large enough to transmit that volume from the lake to the canal except at velocities which are an obstruction to navigation. The amount which the Secretary of War has thus far permitted the sanitary district to pass through the river is 4,167 cubic feet per second. In order to obtain authority for a larger amount the trustees have undertaken to enlarge the channel of the river and have accomplished a large amount of work in that direction.

11. By act of the Illinois Legislature in 1903 the sanitary district was enlarged by annexing thereto the north shore district, containing 78.6 square miles, and the Calumet district, containing 94.48 square miles. The total area of the sanitary district is therefore now 358.08 square miles. The same legislature authorized the development of the water power created by the diversion.

12. The plans for the north shore region involve two additional conduits from the lake to the North Branch of the Chicago River, one at Lawrence avenue, into which 583 cubic feet per second, and one at Wilmette, into which 1,000 cubic feet per second, are to be pumped. As this water is to form a part of the 10,000 cubic feet originally to be taken out through that river, it does not add to the amount of water to be taken from Lake Michigan.

2415 13. The plans for the Calumet region involve a treatment of the Calumet River similar to that of the Chicago River. The river is to be diverted into the Des Plaines Valley. For this purpose a new channel is to be cut through the southerly depression in the divide, and to join the present drainage canal at Sag, about 11 miles from the controlling works at Lockport. From Sag to Lockport the drainage canal must carry the flow from the Calumet River in addition to that from the Chicago River. It was designed to accomodate the latter river alone, or 10,000 cubic feet per second, but improved methods of excavation, particularly channeling in rock, gave it a greater capacity than was computed; and the hydraulic formulae with which its dimensions were figured, being adapted to smaller streams, gave results which proved to be too large. It is found that the portion completed in rock, which includes the reach from Sag to Lockport, will carry an amount stated by the chief engineer to be 14,000 cubic feet per second. The difference, 4,000 cubic feet per second, is the amount which it is proposed to divert from the Calumet River. For this purpose it is proposed to excavate a channel having in earth a bottom width of 72 feet, with side slopes 3 on 5, and in rock a bottom width of 90 feet with vertical sides, the depth in both cases to be 25 feet.

14. Work in the territory annexed in 1903 has been limited to surveys, and the preparation of plans, and the expenditures in that territory have been small. The amount expended upon the drainge canal and accessory works, including the above, to December 31, 1905, is $40,873,629.71; in addition to which $1,556,226.56 has been expended for the development of water power and $7,290,101.27 has been paid out for interest. For a financial statement more in detail, see Appendix I.

15. Although the primary object of the Chicago Drainage Canal was the discharge of Chicago sewage, its function as a channel for navigation was kept in view from the beginning. All of the bridges over it are draw-

bridges with ample openings. A provision of this kind, as well as the care exercised to make the sewage inoffensive by liberal dilution, was necessary to conciliate the interests in the valley of the Des Plaines and Illinois River,
2416 which would otherwise be adversely affected. It can hardly be doubted that the canal will eventually form a part of an improved waterway between the Great Lakes and the Mississippi River, though its full depth will probably not be required for that purpose. Congress has not adopted any scheme for this improvement, but by its direction a survey was made, and plans with estimates for a waterway 14 feet deep were submitted, by a board of engineers in a report dated August 26, 1905. The board found that for a distance of about 100 miles from Chicago the improvement must be with locks and dams, and as the quantity of water required would be merely that needed for the service of locks and other incidentals, the extent of the improvement of depth which could be obtained in that part of the route was without limit so far as it depended upon the amount of water available. For the remaining distance, about 223 miles, the improvement would be an enlargement of the open channel and the degree to which it was practicable was entirely dependent upon the quantity of water flowing. The board assumed that the Chicago Drainage Canal would eventually be permitted to take 10,000 cubic feet per second from Lake Michigan ,and it expressed the opinion that with that volume added to the natural low-water discharge of the Illinois River a depth of 14 feet in the open channel could be maintained; also that if a much greater depth was to be secured a much larger volume of water must be taken from Lake Michigan.

16. In the neighborhood of Lockport the natural level of the ground falls away rapidly and excellent facilities are found for the development of water power. Under the state legislation of 1903 the sanitary district is now engaged in utilizing this incidental advantage of the drainage canal. The plans provide for an extension of the canal 10,700 feet between concrete walls and earth and rock embankments to the site selected for the power house and for the excavation of a tail race 6,800 feet long, 160 feet wide, and 22 feet deep. If the maximum quantity of water which the sanitary district now claims to be necessary for sanitary purposes—14,000 feet per second—be utilized it will be possible to develop about 40,000 electrical horsepower under a head of 34 feet. With 10,000 cubic feet per second about 28,000 horsepower can be

developed. A power house is being erected which will accomodate 8 turbines, each capable of generating 5,000 horsepower.

17. The sanitary district has acquired land on both sides of the canal throughout its length, the width of the strips varying from 200 to 800 feet. This land is offered to manufacturers at moderate prices, and it seems probable that they will in the course of time be attracted thereto, particularly after arrangements for furnishing them with cheap power from Lockport are completed.

18. The diversion of large bodies of water from Lake Michigan for supplying the drainage canal has not been authorized by Congres. The plans of the sanitary district, except those for the enlargement of the Chicago River, have not been submitted to any Federal authority for approval. It was only after the opening of the canal that application was made to the Secretary of War for permission to divert the quantity of water required by The State law. The secretary granted permission for such quantity as would pass through Chicago River without detriment to navigation, a quantity considerably less than that required by the State law. After experimenting with various amounts it was fixed at 250,000 cubic feet per minute, or 4,167 cubic feet per second, and that is the amount now authorized. It is 'subject to such modification as, in the opinion of the Secretary of War, the public interests may from time to time require.' Copies of all the permits granted by the Secretary of War in this connection will be found in Appendix I.

19. In the expenditure of $40,000,000 for the drainage canal the people of Chicago, with its population of 2,000,000 incurred a burden equivalent to that due to an expenditure of $1,600,000,000 by the United States, with its population of 80,000,000—that is, enough to build eight or more Panama canals. It was a very serious effort and has commanded the admiration and sympathy of all observers. The diversion of 10,000 cubic feet per second from Lake Michigan affects other interests adversely, but these interests have withheld their opposition, seeming to believe that some such amount was necessary, and apparently willing to contribute their share to protect the lives and health of the people of a great city. The plans calling for that amount have been under public discussion for some years. Although withholding formal approval, the Federal authorities have taken no steps to prevent their execution. Congress has called for a

plan and estimates for an improvement of the waterways connecting with it, the scope of which is fixed by that amount. There appears to be a tacit general agreement that Chicago needs or will need about 10,000 cubic feet of water per second for sanitary purposes and that the city should have it without further question.

20. It was not generally known until after the publication in March last of the report of the American section of this commission upon Niagara Falls that an amount greater than 10,00 cubic feet per second would be asked for. In that report, subsequently concurred in by the Canadian section, it was recommended that the diversion of 10,000 cubic feet be allowed. The preservation of Niagara Falls alone was considered, and that in the light of the tacit agreement above described. It was supposed at the time that this was all that Chicago needed, but the recommendation gave offense to the officials of the sanitary district, and the further demand then came out in the form of appeals to the committees of Congress and to the Secretary of State. It is necessary now to take up the question anew, and, after considering it in all its bearings, to reach some conclusion as to whether there should be a limit to the amount of water to be diverted at Chicago, and, if so, as to what that limit is.

21. That the abstraction of water from Lake Michigan has a tendency to lower the level of that lake and of all the waters to which it is tributary is self-evident; but the exact effect of abstracting a given amount can be ascertained only from prolonged observation of the natural outlets under the varying conditions to which they are subjected during a series of years. An elaborate investigation of this subject was made under the office of the United States Lake Survey in Detroit, the results of which were published in the annual reports of the Chief of Engineers for 1900, page 5401; for 1902, pages 2779 and 2825; and for 1904, page 4120. Further observations are needed to be made when the difference of the level between Lake Erie and Lake Huron is greater or less than when the existing observations were made, but the results obtained from the latter are believed to be reliable within one-tenth of a foot. The amounts by which the
2419 mean level, as derived from observations of the last 46 years of the various waters will be lowered by a discharge of 10,000 and also by 14,000 cubic feet per second are given in the following table:

Location	Water level lowered by diversion at Chicago of—	
	10,000 cubic feet per second. Foot.	14,000 cubic feet per second. Foot.
Lakes Huron and Michigan	0.52	0.70
Lake St. Clair	.45	.64
Lake Erie	.45	.64
Lake Ontario	.35	.49
St. Lawrence River at Rapids Plat	.40	.56

From this table it appears that all the waters, including Lakes Michigan and Huron, Lake St. Clair, Lake Erie, Lake Ontario, and the St. Lawrence River, besides the important connecting channels, the Detroit and St. Clair Rivers, will be lowered by amounts varying from 4¼ to 6¼ inches for 10,000 cubic feet and from 6 to 8½ inches for 14,000 cubic feet per second. The length of time required to produce this effect is about five years; about half of it will be produced at the end of 18 months. The above figures give the effect at average level; they are much more considerable during low-water periods.

22. Variations in the level of the lakes' surface, due to winds and to change of barometric pressure, are frequent and irregular and at times violent. Variations of more than 6 inches are very common, often occurring hourly for many hours in succession, while variations of 2 or 3 feet within an hour are not uncommon. Besides these irregular variations there is a regular annual variation due to the difference in rainfall, evaporation, and run-off, the water level being highest in midsummer and lowest in midwinter. The levels are affected also by the greater or less severity of the winter and the consequent greater or less decreases in the discharging capacity of the outlets by ice. In order to study the annual oscillatons it is necessary to eliminate the irregular oscillations, and
2420 that is accomplished by using the average levels for a month. Using the monthly mean levels it is found that the regular fluctuation in Lake Huron-Michigan usually does not exceed 2 feet in any one year, but in a long series of years there is a great difference in the height

to which high water will rise. The highest high water (monthly mean) recorded for that lake was in June, 1886, and the lowest high water in June, 1896, the difference between the two being over 3½ feet. The first is what navigators of the Great Lakes call a high-water year and the second a low-water year.

23. It is evident that the average level of the lake may be lowered considerably without the change becoming immediately apparent, and that fact has been used as an argument to prove that the lowering caused by the Chicago Drainage Canal is of no consequence to those interested in navigation. Since they can not see it they will not know it and will not feel it. The argument is fallacious. It is true that they cannot see it immediately, they will soon feel it and will know it through the most costly means of acquiring knowledge—the injury to their material interests. The oscillations will remain the same as before, but low water will fall lower and high water will rise less high. The average draft of vessels must be diminished by the amount that the average level is lowered unless the depth be restored by remedial works.

24. The most important lake traffic is now carried on in large freight carriers which are loaded down to the greatest draft that can be carried into the harbors or through the channels between the lakes. With the depth now available they are usually loaded to a draft of about 19 feet, but careful watch is kept on the stage of the waterways and advantage is taken of any temporary increase of stage to load the vessels deeper. In the modern vessel each inch of increased draft adds about 50 tons to the carrying capacity. To lower the water surface 6 inches is to reduce the capacity of the vessel about 300 tons. If the freight rate on iron ore be taken at 55 cents per ton, exclusive of the cost of loading and unloading, and the number of trips during the season at 22, there appears a loss of over $3,600 for the season for each vessel. The number of vessels navigating the Great Lakes which draw 19 feet or more is 417, and their tonnage is 1,541,414 tons, which is about three-quarters of the total tonnage of the
2421 Great Lakes. It is a conservative estimate that the loss to the navigation interests resulting from a reduction of 6 inches in the depth of the water is $1,500,000 per annum, which capitalized at 4 per cent, amounts to a loss of $37,500,000. With a greater reduction of depth the resulting loss would be proportionately greater. The number of deep draft vessels and the share of lake traffic which

they carry is increasing each year, while the lake traffic itself is increasing with mavelous rapidity. The total number of tons of freight which passed through Detroit River in 1905 was about 58,000,000, valued at about $615,000,000. The records for the year 1906, so far as they are made up, indicate that the number of tons which passed through the Detroit River in 1908 exceeded 65,000,000, valued at $690,000,000. The loss will be even greater in the future than it is now. It is quite certain that the loss will not pass unnoticed, and that the Governments will be compelled to restore the depth either by additional excavations or by regulating works.

25. Careful estimates have been made of the cost of deepening the channels between the lakes 1 foot. To deepen the Detroit River is estimated to cost $4,115,430. In Lake St. Clair the full depth of the lake is now utilized, and any lowering of its surface involves the excavation of an artificial channel entirely across the lake, a distance of 18 miles, of which it has been necessary heretofore to artificially deepen only one-third. To deepen the channel here and at certain shoal places in St. Clair River and at the foot of Lake Huron is estimated to cost $1,080,720. It results in replacing open lake navigation by canal navigation for a distance of 12 miles in Lake St. Clair, a decided disadvantage.

26. The data are not at hand for an accurate estimate of the cost of restoring the depths in the harbors of the Great Lakes, but an approximation may be reached from a consideration of the cost of improvement heretofore made. The depth to be gained being small, the cost will not vary largely, whether that gain be a few inches more or less. The United States has improved 35 harbors on Lake Michigan, Huron, Erie, and has expended thereon about $20,000,000, of which about one-quarter was for maintenance. The average increase of depth is 10 feet
2422 and the cost per foot of increase was therefore about $1,500,000, but as the cost of a small increase would be much greater per foot than an increase of 10 feet, and as several harbors on Lake Ontario are to be added, the cost per foot in this case would probably not be less than $2,000,000 for harbors in the United States. The Canadian Government has improved over 50 harbors on Georgian Bay, Lake Huron, St. Clair, Erie and Ontario. A large amount, say $3,000,000, must be added for increasing the depth of these harbors.

27. The depth in the Welland Canal and in the six canals employed to overcome rapids in the St. Lawrence River is now 14 feet, of which every inch is needed. At the head of the Cornwall Canal in the St. Lawrence River the abstraction of 14,000 cubic feet of water per second at Chicago will lower the surface about 6¾ inches at mean level and much more at low water. To restore the depth in these canals involves the reconstruction of all the end locks and deepening the approaches thereto, and is estimated to cost $2,500,000.

28. The total cost of restoring the depth in the harbors of the Great Lakes and the channels between the lakes is therefore roughly $10,000,000, and of restoring it in the Welland and St. Lawrence Canals is $2,500,000 additional, or $12,500,000 in all.

29. The shores of the Great Lakes are very far from being fully developed, and it is highly probable that many harbors not now in existence remain to be created, or if in existence remain to be improved. The lowering of the lakes' surface increase the difficulty and cost of such improvements. This consideration is of importance, although no money value can now be given it.

30. The expenditure of the sums mentioned above will restore the depths now existing, but it will not prevent very serious annoyance to the navigation interests during the execution of the work. The time required will be several years, and in the meantime the vast commerce of the Great Lakes will be hampered, not only by deficient depth, but also by the occupation of the channels, already crowded with commerce, by the excavating machines.

31. It is evident from the foregoing that large bodies of water cannot be diverted by the Chicago Drainage
2423 Canal without very serious detriment to the navigation interests of the Great Lakes and of the St. Lawrence Valley. The greater the amount of water diverted the greater the injury. Chicago being one of the principal lake ports. there will be very few communities which will feel this detriment more than she will.

32. In the presence of these interests, the effect upon Niagara Falls may be simply mentioned with a reference to our former reports on that subject. The volume of Niagara Falls will be reduced by the full amount diverted at Chicago.

33. The City of Chicago was organized as a city in 1837 with a population of about 4,000. Its population in 1840 was 4,479; in 1850, 28,269; in 1860, 112,172; in1870, 298,977; in 1880, 503,185; in 1890, 1,099,850; and in 1900 it was 1,698, 575. It is estimated now to be about 2,000, 000. Should the rate of growth continue which prevailed between 1880 and 1900, the population will be 3,000,000 in the year 1922, and 4,000,000 in the year 1939. It is impossible to foretell its future growth, but there is no reason to doubt that it will in time greatly exceed the largest of these numbers. The city is the commercial center of an empire still in its infancy. It is entirely reasonable to expect a population of five or six millions or more. It will cover territory not now covered. Methods of sewerage disposal appropriate to one portion of it may not be appropriate to other portions. If the diversion of 20,000 cubic feet per minute (or 333⅓ cubic feet per second) for each 100,000 of population, as required by the State law, is accepted as the standard, then from 17,000 to 20,000 cubic feet per second will be required, and the 14,000 cubic feet now contemplated will not be sufficient. Even more than 20,000 cubic feet will be required for a population greater than 6,000,000. The diversion of 20,000 cubic feet per second would lower Lakes Michigan and Huron about 13 inches and Lake Erie about 11 inches. Plans which lead to this result should be carefully scrutinized.

34. One of the reasons given in 1889 for adopting this method of disposing of Chicago sewage was that it offered the advantage of furnishing a navigable waterway from Chicago to the Mississippi River. The navigable depth or capacity of such a waterway has never been authoratively fixed. Congress has considered a depth of 14 feet to the extent of ordering a survey and estimates of cost for that depth, but the Illinois legislature has declared its policy to be to secure the construction of a deeper channel, not limiting its proposed capacity in
2424 terms, but defining it to be 'of the greatest practicable depth and usefulness for navigation.' See joint resolution adopted May 27, 1889, copy omitting preamble hereto appended, marked 'I_5.' A fair interpretation of this language gives a proposed depth of 20 feet, that being the depth required to accomodate the most important vessels now navigating the Great Lakes. It will require a volume of water greater than the 10,000 cubic feet per second originally contemplated.

35. The amount which it is proposed to divert from the Calumet River 4,000 cubic feet per second, is fixed by accident rather than by design, being the excess which the Chicago Drainage Canal is found capable of carrying after providing for the 10,000 cubic feet from the Chicago River, for which it was originally constructed. It is certain that no greater amount than 4,000 cubic feet can be diverted from the Calumet without checking the flow from the Chicago River, and thus giving relief to a suburban portion of the city at the expense of the richest and most populous centers.

36. It is equally certain that the diversion of 4,000 cubic feet or less will not at all times afford the desired relief to the Calumet. In the first place it provides for a population of only 1,200,000, a number which will in all probability be greatly exceeded at a day not remote. At present the population is estimated at about 200,000, but for the present necessities it is not a question of population, but of drainage area and rainfall. A flood discharge of the Calumet has been measured at Riverdale, about 10 miles from its mouth, of about 13,300 cubic feet per second from a drainage area of about 700 square miles, and even that amount may at times be exceeded. The total drainage area of the Calumet region, including the Sag Valley, is about 825 square miles, and assuming the discharge to increase in proportion to the area, the flood discharge to be provided for is over 15,700 cubic feet per second. The diversion of only 4,000 cubic feet will not prevent a heavy discharge into Lake Michigan in time of flood. To overcome this difficulty it is proposed, if suitable legislation can be secured, to divert the upper Calumet into Lake Michigan through an artificial channel to be excavated in Indiana about 17½ miles east of the
2425 State line. Indiana has not authorized such diversion, but supposing it to be accomplished, there will still be times when the discharge from the drainage area remaining to be cared for by the canal, 238 square miles, will exceed 4,000 cubic feet per second. The excess must enter Lake Michigan through the mouth of the Calumet, and at such times the system will fail. Of course it makes no provision for the future occupation of the upper Calumet region and the pollution of the lake from that source. It thus appears that the diversion of the Calumet River as now proposed by the Sanitary District will not be complete even for the present, and will not make adequate provision for the future.

37. The diversion of 4,000 cubic feet per second provides for a population of 1,200,000 by the standard fixed by the State law. The population of the Calumet region is now about 200,000, and until it reaches 1,200,000 only a part of the flow will be needed for sanitary purposes during a large part of the year; but the channel must be there, available for the full flow, if this method of sewage disposal is to be useful to any population, however small. Likewise the channel from the Chicago River must be, as it is, large enough to provide for a population of 3,000,000, whether that number of people are ever to become tributary to the Chicago River or not. The channels having once been constructed, any reduction of flow below their fullest capacity is a dead loss to the water power dependent upon them. It has been said that it would be absurd to develop water power at the cost per horsepower which this water power costs if the drainage canal be included, and that is true. But being given the channels, it would not be absurd to use them to their fullest capacity. The Chicago Drainage Canal having been constructed, with a capacity, as it turn out, of 14,000 cubic feet per second, full power development will call for the whole of that amount, and in fact power works are now under construction at Lockport to utilize it. Inasmuch as the sanitary requirements by the standard fixed in the State law are only 6,667 cubic feet per second for the present population of 2,000,000, it is evident that power development incidental though it be, does lead to demands for water not required for sanitary purposes.

38. It remains to be seen whether any diversion, complete or otherwise, is necessary to preserve the health of Chicago. Upon this point the commission sought the advice of two eminent sanitary engineers—Messrs. Rudolph Hering and George W. Fuller—whom it instructed as fol-
2426 lows, viz.: 'To examine the sanitary situation at Chicago, so far as it is affected by sewage disposal, and to report whether it is or is not necessary to the health of the city to extend to outlying territory the system which was adopted in 1889 for the main city. * * * The commission desires an emphatic opinion from authoritative sources as to whether the system of diverting the water of Lake Michigan in large quantities into the Illinois Valley is the only way to preserve the lives and health of the people of Chicago. It does not desire an investigation of the effect upon the navigation interests

of the Great Lakes. It has satisfied itself upon that point. Nor does it wish to reopen the case of the Chicago Drainage Canal as designed and built. It accepts that as a fixed fact, with its attendant diversion of 10,000 cubic feet per second through the Chicago River. The extension of the system to the Calumet River alone is in question, and the question is, Are there not other methods of sewage disposal which can be applied here at a cost not exceeding much, if at all, the cost of the method proposed, and which will be equally effective in preventing the pollution of the lake? It desires a report upon the various systems which may be found available for application here, with a statement of their relative efficiency. It also desires a statement of their relative cost, so far as that can be given without the preparation of detailed plans. The latest conclusions of sanitary engineers as to the amount of dilution which is required to make sewage inoffensive should be given.' These gentlemen visited Chicago, and after a thorough examination of the situation submitted a report, of which a copy is hereto appended, marked 'I.' The entire report should be carefully studied. Its conclusions only are here quoted. They are as follows, viz.:

'The latest conclusions of sanitary engineers as to the amount of dilution which is required to make sewage inoffensive are that a dilution of 3½ cubic feet per second for each 1,000 persons connected with the sewers, as provided for in the enactment of the Illinois legislature in 1889, is as low a figure as it is now possible to state. We believe that with the elimination of objectionable trade wastes and the occasional dredging of the river this amount of dilution will be sufficient to prevent offensiveness.

The extension of the dilution method to the outlying territory is not the only way to preserve the lives and
2427 health of the people of Chicago. The application of the method, with flow of 10,000 and 14,000 cubic feet per second, respectively, for the area tributary to the present drainage canal, will serve populations not exceeding 3,000,000 and 4,200,000, respectively. For greater populations other methods of sewage disposal will be required.

For the Calumet area, as well as other districts, there are several methods for the disposal of sewage as effective as the present method of dilution in preventing the pollution of the lake waters.

All these methods involve intersecting sewers and pumping stations to collect and deliver the sewage at suitable sites. Septic tanks are used for partially clarifying the sewage, which may then be applied to any one of three methods, of filters, viz.: intermittent sand filters, contact filters and sprinkling filters.

All of these filters if well built and well managed remove the suspended and organic matters so that the effluents are practically clear and non-putrescible. The removal of bacteria by these three types of filters average at least 98, 80 and 90 per cent., respectively. Such effluents may be discharged into any of the water courses of the Calumet region.

The approximate total costs, liberally estimated, without the preparation of detailed plans, for a population of 1,200,000 are as follows:

A—Intermittent Sand Filters.

Construction	$11,063,000
Annual cost of operation, $866,000, capitalized at 5%	17,320,000
	28,383,000

B—Contact Filters.

Construction	$11,787,500
Annual cost of operation, $551,000, capitalized at 5%	11,020,000
	22,807,500

C—Sprinkling Filters.

Construction	$ 9,257,500
Annual cost of operations, $419,000, capitalized at 5%	8,380,000
	17,637,500

2428 The present population on the Calumet area of the sanitary district being less than 200,000 would naturally require but a portion of the cost of estimated works and of their operation to be expended at the outset.

Of the available methods of disposing of the sewage of the Calumet area other than by dilution, the sprinkling

filter method, being the cheapest both in cost of construction and of operation and accomplishing an adequate degree of purification, is clearly the most advantageous one.'

These engineers stand in the front rank of their profession as sanitary experts. One of them, Mr. Hering, was chairman of the commission of 1887, whose report to the mayor and city council of Chicago was the foundation of the subsequent legislation and led to the construction of the drainage canal. The conclusions reached are those of friends of Chicago and not of her enemies or rivals.

39. A method of sewage disposal for the Calumet region is proposed which for a population of 1,200,000 is estimated to cost $17,637,500. For the present population of about 200,000 only a part of the expense need be incurred, and the works can be developed as the population increases. It can, when the necessity arises, be applied with a population much exceeding 1,200,000. The cost of diverting the Calumet River into the Chicago Drainage Canal is estimated at $12,000,000. The greater efficiency at present and in the future of the method now proposed would justify a considerable increase of cost, but in view of the fact that the entire expense of the diversion must be incurred at the outset, while by the new method the expenditures will be regulated by the growth of population, the difference in cost may be considered unimportant.

Summary.

40. The following is a summary of the more important facts recited in this report:

(a) Chicago obtains its water supply from Lake Michigan, and to avoid polluting it must either dispose of its sewage otherwise than in the lake or place its intakes for water at a great distance from the city.

(b) The topography of the country favors the discharge of the sewage into the Des Plaines River, a tributary of the Mississippi, through two depressions in the divide which separate that river from Lake Michigan.

(c) The slope on the lake side of the divide is drained
2429 by two streams—the Chicago River and the Calumet River—into which the sewers of the city empty. By a cut through the northerly depression the flow of the Chi-

cago River has been reversed and diverted into the Des Plaines River instead of into Lake Michigan, and by a cut through the southerly depression the same process can be applied to the Calumet River.

(d) To make this reversal effective the channels must be large enough to take all the water which falls upon the respective drainage areas during the most violent rainstorms. This amount is estimated at 10,000 cubic feet per second for the Chicago River and 15,700 cubic feet per second for the Calumet River.

(e) The City of Chicago was originally built upon tha Chicago River, and that stream now drains the richest and most populous part of the city. It is now spreading over the Calumet region.

(f) In 1889 the plan of diverting the Chicago River into the valley of the Des Plaines was definitely adopted, and the Chicago Drainage Canal was undertaken. It was designed to carry 10,000 cubic feet per second. Though not entirely completed, it has been in use since January, 1900. The amount expended upon the canal and accessory work is about $41,000,000.

(g) The Illinois law which authorized the canal required a flow of 333 cubic feet per second for each 100,000 of population in order to render the sewage inoffensive. This amount of dilution is probably not excessive. It is reasonable to expect a population in a future not remote of five or six millions or more, involving the diversion by this standard of some 20,000 cubic feet per second. The Chicago River with its 10,000 cubic feet provides for a population of 3,000,000. The present population of the city is about 2,000,000.

(h) It is now proposed to apply to the Calumet River a treatment similar to that applied to the Chicago River, viz.: to reverse its flow, so that instead of discharging into Lake Michigan it shall discharge into the Des Plaines, but for a part of the new route it must follow the drainage canal already excavated for the Chicago River.

(i) Although the Chicago Drainage Canal was designed to carry 10,000 cubic feet per second, it is found to have, in its completed rock portion, an actual capac-
2430 ity of 14,000 cubic feet. This additional capacity fixes the amount which it is proposed to divert from the Calumet at 4,000 cubic feet per second. Any greater amount

from the Calumet will overtax the drainage canal at the expense of the richest part of Chicago and for the benefit of a suburban part.

(k) The diversion of only 4,000 cubic feet will not be effective at all times, since a much greater amount must be diverted from the Calumet during heavy rainstorms if the lake is to be protected. Moreover, it provides for a population not exceeding 1,200,000, which number will probably be exceeded at a date not far distant.

(l) The large channels necessary to provide for the contingencies of rainstorms are capable of discharging a volume of water largely in excess of sanitary requirements during the greater part of the year, but the development of water power creates the demand that they be employed to their full capacity throughout the year.

(m) The diversion of large bodies of water from Lake Michigan for supplying the drainage canal has not been authorized by Congress, but there appears to be a tacit general agreement that no objection will be made to the diversion of 10,000 cubic feet per second, as originally planned.

(n) The diversion of 10,000 cubic feet per second will lower the levels of Lake Michigan-Huron, Lake St. Clair, Lake Erie, Lake Ontario, and the St. Lawrence River, besides the important connecting channels, the Detroit and St. Clair Rivers, by amounts varying from 4¼ to 6¼ inches for the different waters, and the diversion of 14,000 cubic feet will lower them from 6 to 8½ inches. The diversion of 20,000 cubic feet will lower Lake Michigan-Huron about 13 inches and Lake Erie about 11 inches.

(o) The lake traffic which passed through the Detroit River in 1905 was about 58,000,000 tons, valued at about $615,000,000. It is increasing annually with marvelous rapidity. The records for the year 1906, so far as they are made up, indicate that the number of tons which passed through the Detroit River in 1906 exceeded 65,000,000, valued at $690,000,000. The lowering of the water surface has a very injurious effect upon this traffic and upon that of the Welland and St. Lawrence Canals. Chicago being one of the principal lake ports, there will be very few communities which will feel the injury more than she will.

2431 (p) The cost of restoring the depth in the harbors of the Great Lakes and the channels between the lakes is estimated at $10,000,000, and of restoring it in the Welland and St. Lawrence Canals at $2,500,000. This expenditure would not prevent very serious annoyance to the navigation interests during the execution of the remedial works, which would occupy several years. In Lake St. Clair navigation of the open lake would be replaced by that of an artificial channel or canal with submerged banks.

(q) The extension to the Calumet region of the method of sewage disposal already applied to the Chicago River is not necessary to preserve the health of Chicago, there being other and better methods available for the Calumet region. The final cost of these methods is somewhat greater than that of the one proposed, but the works can be developed as the population increases, and only a part of their cost need be incurred at present, while their greater efficiency justifies the increase of final cost.

(r) The diversion of 10,000 cubic feet of water per second at Chicago will render practicable a waterway to the Mississippi River 14 feet deep. Any greater depth must be obtained by the abstraction of more water from Lake Michigan and at the expense of the navigation interests of the Great Lakes and of the St. Lawrence Valley.

(s) The effect upon Niagara Falls of diverting water at Chicago is of secondary importance when considering the health of a great city and the navigation interests of the Great Lakes and of the St. Lawrence Valley, but it is proper to note that the volume of the falls will be diminished by the full amount diverted at Chicago.

Recommendations.

41. The waters of Lake Michigan in the United States, the waters of Georgian Bay in Canada, and the waters of Lake Superior partly in the United States and partly in Canada all form sources of supply of the Great Lakes system, finding their way by St. Lawrence to the sea. All are interdependent and there can be no diversion from any of them without injury to the whole system. By Article XXVI of the treaty of 1871 it is provided that

2432 'navigation of the river St. Lawrence, ascending and descending from the forty-fifth parallel of north latitude, where it creases to form the boundary between the two countries, from, to, and into the sea, shall forever remain free and open for the purposes of commerce to the citizens of the United States, subject to any laws and regulations of Great Britain, or of the Dominion of Canada, not inconsistent with such privileges of free navigation.' It is desirable that in any treaty arrangement the waters of Lake Michigan, Georgian Bay, and all other waters forming part of the Great Lakes system should be declared to be 'forever free and open for the purposes of commerce' to the citizens of the United States and the subjects of His Britannic Majesty, subject to any laws and regulations of either country not inconsistent with such privilege of free navigation.

42. The preservation of the levels of the Great Lakes is imperative. The interest of navigation in these waters is paramount, subject only to the right of use for domestic purposes, in which term is included necessary sanitary purposes. In our report of November 15, 1906, upon the application of the Minnesota Canal & Power Co. to divert certain waters in Minnesota, we recommended, among other things 'that any treaty which may be entered into should define the uses to which international waters may be put by either country without the necessity of adjustment in each instance, and would respectfully suggest that such uses should be declared to be (a) uses for necessary domestic and sanitary purposes; (b) service of locks for navigation purposes; (c) the right to navigate.' It is our opinion that so far as international action is concerned a treaty provision of that kind is all that is required in this case. We accordingly renew our recommendation of November 15, 1906, just quoted.

43. A careful consideration of all the circumstances leads us to the conclusion that the diversion of 10,000 cubic feet per second through the Chicago River will, with proper treatment of the sewage from areas now sparsely occupied, provide for all the population which will ever be tributary to that river, and that the amount named will therefore suffice for the sanitary purposes of the city for all time. Incidentally it will provide for the largest navigable waterway from Lake Michigan to the Mississippi River which has been considered by Congress.

We therefore recommend that the Government of the United States prohibit the diversion of more than 10,000 cubic feet per second for the Chicago Drainage Canal.

All of which is respectfully submitted.

International Waterways Commission progress report, Senate Doc. 959, 62d Congress, 3d Session, pages 67-77."

April 25, 1906, the Canadian Section of the International Waterways Commission made report recommending the division of waters of the Niagara River at Niagara Falls, in which there was allotted to the Chicago Drainage Canal 10,000 second feet. (Rec. Vol. VIII, p. 159; This Narrative p. 104.)

May 3, 1906, the International Waterways Commission, signed by both the American and Canadian members, made a report with similar recommendations. (Vol. VIII, p. 160, this Narrative p. 104.)

On January 11, 1909, the United States made a treaty with Great Britain regarding the use of Canadian boundary waters, which is as follows (Rec. Vol. IV, p. 2561-2572):

"Treaty between the United Kingdom and the United States of America relating to Boundary Waters and

Questions arising along the Boundary between Canada and the United States, signed at Washington, January 11, 1909.*

Treaty relating to Boundary Waters and Questions arising along the Boundary between Canada and the United States, signed at Washington, January 11, 1909.

His Majesty the King of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas, Emperor of India, and the United States of America, being equally desirous to prevent disputes re-
2562 garding the use of boundary waters and to settle all questions which are now pending between the United States and the Dominion of Canada involving the rights, obligations or interests of either in relation to the other or to the inhabitants of the other, along their common frontier, and to make provision for the adjustment and settlement of all such questions as may hereafter arise, have resolved to conclude a Treaty in furtherance of these ends, and for that purpose have appointed as their respective Plenipotentiaries:

His Britannic Majesty, the Right Honourable James Bryce, O. M., his Ambassador Extraordinary and Plenipotentiary at Washington; and

The President of the United States of America, Elihu Root, Secretary of State of the United States;

Who, after having communicated to one another their full powers, found in good and due form, have agreed upon the following Articles:

Preliminary Article

For the purposes of this Treaty boundary waters are defined as the waters from main shore to main shore of the lakes and rivers and connecting waterways, or the portions thereof, along which the international boundary between the United States and the Dominion of Canada passes, including all bays, arms, and inlets thereof, but

---

* Ratifications advised by the Senate ..... March 3, 1909
Ratified by the President ..... April 1, 1910
Ratified by Great Britain ..... March 31, 1910
Ratifications exchanged at Washington ..... May 5, 1910
Proclaimed ..... May 13, 1910

not including tributary waters which in their natural channels would flow into such lakes, rivers, and waterways, or waters flowing from such lakes, rivers, and waterways, or the waters of rivers flowing across the boundary.

ARTICLE 1

The High Contracting Parties agree that the navigation of all navigable boundary waters shall forever continue free and open for the purposes of commerce to the inhabitants and to the ships, vessels, and boats of both countries equally, subject, however, to any laws and regulations of either country, within its own territory, not inconsistent with such privilege of free navigation, and applying equally and without discrimination to the inhabitants, ships, vessels, and boats of both countries.

It is further agreed that so long as this Treaty shall remain in force this same right of navigation shall extend
2563 to the waters of Lake Michigan, and to all canals connecting boundary waters and now existing or which may hereafter be constructed on either side of line. Either of the High Contracting Parties may adopt rules and regulations governing the use of such canals within its own territory, and may charge tolls for the use thereof; but all such rules and regulations and all tolls charged shall apply alike to the subjects or citizens of the High Contracting Parties and the ships, vessels, and boats of both of the High Contracting Parties, and they shall be placed on terms of equality in the use thereof.

ARTICLE 2

Each of the High Contracting Parties reserves to itself, or to the several State Governments on the one side and the Dominion or Provincial Governments on the other, as the case may be, subject to any Treaty provisions now existing with respect thereto, the exclusive jurisdiction and control over the use and diversion, whether temporary or permanent, of all waters on its own side of the line which in their natural channels would flow across the boundary or into boundary waters; but it is agreed that any interference with or diversion from their natural channel of such waters on either side of the boundary resulting in any injury on the other side of

the boundary, shall give rise to the same rights and entitle the injured parties to the same legal remedies as if such injury took place in the country where such diversion or interference occurs; but this provision shall not apply to cases already existing or to cases expressly covered by special agreement between the parties hereto.

It is understood, however, that neither of the High Contracting Parties intends by the foregoing provision to surrender any right which it may have to object to any interference with or diversions of waters on the other side of the boundary the effect of which would be productive of material injury to the navigation interests on its own side of the boundary.

ARTICLE 3

It is agreed that, in addition to the uses, obstructions, and diversions heretofore permitted or hereafter provided for by special agreement between the Parties
2564 hereto, no further or other uses or obstructions or diversions, whether temporary or permament, of boundary waters on either side of the line, affecting the natural level or flow of boundary waters on the other side of the line, shall be made except by authority of the United States or the Dominion of Canada within their respective jurisdiction and with the approval, as hereinafter provided, of a Joint Commission, to be known as the International Joint Commission.

The foregoing provisions are not intended to limit or interfere with the existing rights of the Government of the United States on the one side and the Government of the Dominion of Canada on the other, to undertake and carry on governmental works in boundary waters for the deepening of channels, the construction of breakwaters, the improvement of harbours, and other governmental works for the benefit of commerce and navigation, provided that such works are wholly on its own side of the line and do not materially affect the level or flow of the boundary waters on the other, nor are such provisions intended to interfere with the ordinary use of such waters for domestic and sanitary purposes.

ARTICLE 4

The High Contracting Parties agree that, except in cases provided for by special agreement between them,

they will not permit the construction or maintenance on their respective sides of the boundary of any remedial or protective works or any dams or other obstructions in waters flowing from boundary waters or in waters at a lower level than the boundary in rivers flowing across the boundary, the effect of which is to raise the natural level of waters on the other side of the boundary unless the construction or maintenance thereof is approved by the aforesaid International Joint Commission.

It is further agreed that the waters herein defined as boundary waters and waters flowing across the boundary shall not be polluted on either side to the injury of health or property on the other.

ARTICLE 5

The High Contracting Parties agree that it is expedient to limit the diversion of waters from the Niagara River so that the level of lake Erie and the flow of the stream shall not be appreciably affected. It is the desire of both
2565 Parties to accomplish this object with the least possible injury to investments which have already been made in the construction of power plants on the United States' side of the river under grants of authority from the State of New York, and on the Canadian side of the river under licenses authorized by the Dominion of Canada and the Province of Ontario.

So long as this Treaty shall remain in force, no diversion of the waters of the Niagara River above the Falls from the natural course and stream thereof shall be permitted except for the purpose and to the extent hereinafter provided.

The United States may authorize and permit the diversion within the State of New York of the waters of the said river above the Falls of Niagara, for power purposes, not exceeding in the aggregate a daily diversion at the rate of 20,000 cubic feet of water per second.

The United Kingdom, by the Dominion of Canada, or the Province of Ontario, may authorize and permit the diversion within the Province of Ontario of the waters of said river above the Falls of Niagara for power purposes, not exceeding in the aggregate a daily diversion at the rate of 36,000 cubic feet of water per second.

The prohibitions of this Article shall not apply to the diversion of water for sanitary or domestic purposes, or for the service of canals for the purposes of navigation.

ARTICLE 6

The High Contracting Parties agree that the St. Mary and Milk Rivers and their Tributaries (in the State of Montana and the Provinces of Alberta and Saskatchewan) are to be treated as one stream for the purposes of irrigation and power, and the waters thereof shall be apportioned equally between the two countries, but in making such equal apportionment more than half may be taken from one river and less than half from the other by either country so as to afford a more beneficial use to each. It is further agreed that in the division of such waters during the irrigation season, between the 1st of April and 31st of October, inclusive, annually, the United States is entitled to a prior appropriation of 500 cubic feet per second of the waters of the Milk River, or so much of such amount as constitutes three-fourths of its natural flow, and that Canada is entitled to a prior appropriation of 500 cubic feet per second of the flow of St. Mary River, or so much of such amount as constitutes three-fourths of its natural flow.

The channel of the Milk River may in Canada be used
2566 at the convenience of the United States for the conveyance, while passing through Canadian territory, of waters diverted from the St. Mary River. The provisions of Article 2 of this Treaty shall apply to any injury resulting to property in Canada from the conveyance of such waters through the Milk River.

The measurement and apportionment of the water to be used by each country shall from time to time be made jointly by the properly constituted reclamation officers of the United States and the properly constituted irrigation officers of His Majesty under the direction of the International Joint Commission.

ARTICLE 7

The High Contracting Parties agree to establish and maintain an International Joint Commission of the United States and Canada composed of six Commissioners, three on the part of the United States appointed by the President thereof, and three on the part of the United Kingdom appointed by His Majesty on the recommendation of the Governor in Council of the Dominion of Canada.

ARTICLE 8

The International Joint Commission shall have jurisdiction over and shall pass upon all cases involving the use or obstruction or diversion of the waters with respect to which under Articles 3 and 4 of this Treaty the approval of this Commission is required, and in passing upon such cases the Commission shall be governed by the following rules and principles which are adopted by the High Contracting Parties for this purpose:—

The High Contracting Parties shall have, each on its own side of the boundary, equal and similar rights in the use of the waters hereinbefore defined as boundary waters.

The following order of precedence shall be observed among the various uses enumerated hereinafter for these waters, and no use shall be permitted which tends materially to conflict with or restrain any other use which is given preference over it in this order of precedence—

1. Uses for domestic and sanitary purposes;

2567 2. Uses for navigation, including the service of canals for the purposes of navigation:

3. Uses for power and for irrigation purposes.

The foregoing provisions shall not apply to or disturb any existing uses of boundary waters on either side of the boundary.

The requirement for an equal division may in the discretion of the Commission be suspended in cases of temporary diversions along boundary waters at points where such equal division can not be made advantageously on account of local conditions, and where such diversion does not diminish elsewhere the amount available for use on the other side.

The Commission in its discretion may make its approval in any case conditional upon the construction of remedial or protective works to compensate so far as possible for the particular use or diversion proposed, and in such cases may require that suitable and adequate provision, approved by the Commission, be made for the protection and indemnity against injury of any interests on either side of the boundary.

In cases involving the elevation of the natural level of waters on either side of the line as a result of the con-

struction or maintenance on the other side of remedial or protective works or dams or other obstructions in boundary waters or in waters flowing therefrom or in waters below the boundary in rivers flowing across the boundary, the Commission shall require, as a condition of its approval thereof, that suitable and adequate provision, approved by it, be made for the protection and indemnity of all interests on the other side of the line which may be injured thereby.

The majority of the Commissioners shall have power to render a decision. In case the Commission is evenly divided upon any question or matter presented to it for decision, separate reports shall be made by the Commissioners on each side to their own Government. The High Contracting Parties shall thereupon endeavor to agree upon an adjustment of the question or matter of difference, and if an agreement is reached between them, it shall be reduced to writing in the form of a Protocol, and shall be communicated to the Commissioners, who shall take such further proceedings as may be necessary to carry out such agreement.

Article 9

The High Contracting Parties further agree that any other questions or matters of difference arising between them involving the rights, obligations, or interests of
2568 either in relation to the other or to the inhabitants of the other, along the common frontier between the United States and the Dominion of Canada, shall be referred from time to time to the International Joint Commission for examination and report whenever either the Government of the United States or the Government of the Dominion of Canada shall request that such questions or matters of difference be so referred.

The International Joint Commission is authorized in each case so referred to examine into and report upon the facts and circumstances of the particular questions and matters referred, together with such conclusions and recommendations as may be appropriate, subject, however, to any restrictions or exceptions which may be imposed with respect thereto by the terms of the reference.

Such reports of the Commission shall not be regarded as decisions of the questions or matters so submitted either on the facts or the law and shall in no way have the character of an arbitral award.

The Commission shall make a joint report to both Governments in all cases in which all or a majority of the Commissioners agree, and in case of disagreement the minority may make a joint report to both Governments, or separate reports to their respective Governments.

In case the Commission is evenly divided upon any question or matter referred to it for report, separate reports shall be made by the Commissioners on each side to their own Government.

Article 10

Any questions or matters of difference arising between the High Contracting Parties involving the rights, obligations or interests of the United States or of the Dominion of Canada either in relation to each other or to their respective inhabitants, may be referred for decision to the International Joint Commission by the consent of the two Parties, it being understood that on the part of the United States any such action will be by and with the advice and consent of the Senate, and on the part of His Majesty's Government with the consent of the Governor-General in Council. In each case so referred, the said Commission is authorized to examine into and report upon the facts and circumstances of the particular questions and matters referred, together with such conclusions and recommendations as may be appropriate, subject, however, to any restrictions or exceptions which may be imposed with respect thereto by the terms of the reference.

A majority of the said Commissioners shall have power
2569 to render a decision or finding upon any of the questions or matters so referred.

If the said Commission is equally divided, or otherwise unable to render a decision or finding as to any questions or matters so referred, it shall be the duty of the Commissioners to make a joint report to both Governments, or separate reports to their respective Governments, showing the different conclusions arrived at with regard to the matters or questions so referred, which questions or matters shall thereupon be referred for decision by the High Contracting Parties to an Umpire chosen in accordance with the procedure prescribed in the fourth, fifth and sixth paragraphs of article 45 of The Hague Convention for the pacific settlement of international disputes, dated October 18, 1907. Such Um-

pire shall have power to render a final decision with respect to those matters and questions so referred on which the Commission failed to agree.

ARTICLE 11.

A duplicate original of all decisions rendered and joint reports made by the Commission shall be transmitted to and filed with the Secretary of State of the United States and the Governor-General of the Dominion of Canada, and to them shall be addressed all communications of the Commission.

ARTICLE 12.

The International Joint Commission shall meet and organize at Washington promptly after the members thereof are appointed and when organized the Commission may fix such times and places for its meetings as may be necessary, subject at all times to special call or direction by the two Governments. Each Commissioner, upon the first joint meeting of the Commission after his appointment, shall, before proceeding with the work of the Commission, make and subscribe a solemn declaration in writing that he will faithfully and impartially perform the duties imposed upon him under this Treaty, and such declaration shall be entered on the records of the proceedings of the Commission.

The United States and Canadian sections of the Com-
2570 mission may each appoint a Secretary, and these shall act as joint Secretaries of the Commission at its joint sessions, and the Commission may employ engineers and clerical assistants from time to time as it may deem advisable. The salaries and personal expenses of the Commission and of the Secretaries shall be paid by their respective Governments, and all reasonable and necessary joint expenses of the Commission, incurred by it, shall be paid in equal moieties by the High Contracting Parties.

The Commission shall have power to administer oaths to witnesses, and to take evidence on oath whenever deemed necessary in any proceeding, or inquiry, or matter within its jurisdiction under this Treaty, and all parties interested therein shall be given convenient opportunity to be heard, and the High Contracting Parties agree to adopt such legislation as may be appropriate and necessary to give the Commission the powers above

mentioned on each side of the boundary, and to provide for the issue of subpoenas and for compelling the attendance of witnesses in proceedings before the Commission. The Commission may adopt such rules of procedure as shall be in accordance with justice and equity, and may make such examination in person and through agents or employes as may be deemed advisable.

ARTICLE 13.

In all cases where special agreements between the High Contracting Parties hereto are referred to in the foregoing Articles, such agreements are understood and intended to include not only direct agreements between the High Contracting Parties, but also any mutual arrangement between the United States and the Dominion of Canada expressed by concurrent or reciprocal legislation on the part of Congress and the Parliament of the Dominion.

ARTICLE 14.

The present Treaty shall be ratified by His Britannic Majesty and by the President of the United States of America, by and with the advice and consent of the Senate thereof. The ratifications shall be exchanged at Washington as soon as possible, and the Treaty shall take effect on the date of the exchange of its ratifications. It shall remain in force for five years, dating from the day
2571 of exchange of ratifications, and thereafter until terminated by twelve months' written notice given by either High Contracting Party to the other.

In faith whereof the respective Plenipotentiaries have signed this Treaty in duplicate and have hereunto affixed their seals.

Done at Washington, the 11th day of January in the year of our Lord one thousand nine hundred and nine.

(L. S.) James Bryce
(L. S.) Elihu Root

The above Treaty was approved by the United States Senate on the 3rd March, 1909, with the following Resolutions:—

Resolved,—That the Senate advise and consent to the ratification of the Treaty between the United States and

Great Britain, providing for the settlement of international difference between the United States and Canada, signed on the 11th day of January, 1909.

Resolved further (*as a part of this ratification*),—That the United States approves this Treaty with the understanding that nothing in this Treaty shall be construed as affecting, or changing, any existing territorial, or riparian rights in the water, or rights of the owners of lands under water, on either side of the International Boundary at the rapids of the St. Mary's River at Sault Ste. Marie, in the use of the waters flowing over such lands, subject to the requirements of navigation in boundary waters and of navigation canals, and without prejudice to the existing right of the United States and Canada, each to use the waters of the St. Mary's River, within its own territory; and further, that nothing in this Treaty shall be construed to interfere with the drainage of wet, swamp, and overflowed lands into streams flowing into boundary waters, and that this interpretation will be mentioned in the ratification of this Treaty as conveying the true meaning of the Treaty, and will, in effect, form part of the Treaty.

Protocol of Exchange.

On proceeding to the exchange of the ratifications of the treaty signed at Washington on January 11, 1909, between Great Britain and the United States, relating to boundary waters and questions arising along the boundary between the United States and the Dominion of
2572 Canada, the undersigned plenipotentiaries, duly authorized thereto by their respective Governments, hereby declare that nothing in this treaty shall be construed as affecting, or changing, any existing territorial, or riparian rights in the water, or rights of the owners of lands under water, on either side of the international boundary at the rapids of the St. Mary's river at Sault Ste. Marie, in the use of the waters flowing over such lands, subject to the requirements of navigation in boundary waters and of navigation canals, and without prejudice to the existing right of the United States and Canada, each to use the waters of the St. Mary's river, within its own territory; and further, that nothing in this treaty shall be construed to interfere with the drainage of wet, swamp, and overflowed lands into streams flowing into boundary waters, and also that this declaration shall be deemed to

have equal force and effect as the treaty itself and to form an integral part thereof.

The exchange of ratifications then took place in the usual form.

In witness whereof they have signed the present Protocol of Exchange and have affixed their seals thereto.

Done at Washington this 5th day of May, one thousand nine hundred and ten.

James Bryce (SEAL)
Philander C. Knox (SEAL)

---

*The British ratification of this further Instrument was deposited with the United States Government July 23, 1910."

Respectfully submitted,

Clyde L. Day
Wm. F. Barrett
Edmund D. Adcock

Permit of January 17, 1903 42
Pleadings 2
Poe (General) Commission Report of (1895) 36

Points.

I. Diversion "affirmatively authorized by law" and "affirmatively authorized by Congress" 89, 111

(a) Appellant's Organic Act under State's Police Power 89, 111

(b) Act of Congress March 2, 1827, specifically authorized diversion 90, 115

Subject. PAGE

(c) Appellee's Officers Observed Illinois' and Appellant's acts. Secretary of War construed March 2, 1827, Act as affirmatively authorizing the diversion 90, 123

(d) Secretary of War's Acts in construing March 2, 1827, Act of Congress have forced judicial interpretation 90, 128

II. **July 11, 1900 permits authorized the diversion so far as appellee is concerned** 92, 131

III. **All conditions of permits fulfilled by appellant; Secretary of War only authorized to grant or refuse permit. Attorney General not authorized to institute this suit** 93, 140

(a) Effect May 8, 1899, Permit 93, 140

(b) Attorney General only authorized to institute suit for removal of structures. No authority to bring this suit 93, 145

(c) Secretary of War only authorized to grant or refuse permit; no power to regulate diversion 93, 151

IV. **The Illinois Act, May 29, 1889; appellant's works thereunder in exercise of State's police power lawful without express consent of Secretary of War. Congress not presumed to interfere with State's action unless intention is plain** 94, 152

(a) Illinois Act May 29, 1889, sufficient authority for Appellant's Diversion 94, 155

(b) Express Consent of Secretary of War unnecessary. This result must obtain unless Congressional intention to the contrary plain 95, 163

(c) By other acts than the March 3, 1899, Act, Congress has shown its intention not to prohibit or limit operation of Appellant's works and its diversion 96, 176

V. **Appellee estopped** 97, 183

Force and effect Treaty January 11, 1909 ..... 97, 188

Subject. PAGE

VI. **Expert witnesses' evidence not sufficient for injunction. Appellee's case based on an inference of unseen** 98, 193

(a) Expert Evidence in Injunction Cases 98, 193

(b) All other questions aside, Injunction cannot issue unless damage to Commerce material obstruction to navigation unreasonable 98, 197

(c) The unreasonable obstruction to navigation and damage to Commerce must clearly exist 99, 198

VII. **Comparative injury. Court of equity will not grant injunction; benefits to complainant are small compared with injury to defendant** 100, 200

VIII. **Secretary of War Stimson not authorized to make findings or conclusions. Anyway, his findings and conclusions of January 8, 1913, erroneous** 101, 205

(a) Statute does not so authorize. If it did, such findings and conclusions subject to review 101, 205

(b) Secretary of War Stimson's findings and conclusions erroneous 101, 207

IX. **Motion of July 12, 1920, by appellant in connection with settlement of decree and that injunction only issue restraining appellant from diverting in excess of 10,000 seconds feet on condition appellant pay cost of compensating works, should have been granted. In any event, no injunction should issue until appellant given opportunity to re-adjust itself** 102, 212

(a) Granting of the motion would have done equity 102, 212

(b) Appellant and community should be given opportunity to readjust itself to changed conditions 103, 218

(c) Decree in any event should have been conditional, giving Secretary of War opportunity to act 103, 225

(d) This matter should be settled by Congress .. 104, 226

Subject. PAGE

Conclusion 104, 228

Power, Secretary of War 151

IN THE

SUPREME COURT OF THE UNITED STATES

OCTOBER TERM, A. D. 1924.

THE SANITARY DISTRICT OF CHICAGO, *Appellant*, vs. THE UNITED STATES OF AMERICA, *Appellee.*	Appeal from the District Court of the United States, for the Northern District of Illinois, Eastern Division.

BRIEF AND ARGUMENT FOR APPELLANT.

STATEMENT OF THE CASE.

MAY IT PLEASE THE COURT:*

Appellant, The Sanitary District of Chicago, is here on appeal from a decree of the District Court, enjoining appellant from abstracting any waters from Lake Michigan across the Continental Divide to the DesPlaines, Illinois and Mississippi Rivers, in excess of 4,167 cubic feet per second, or 250,000 cubic feet per minute. (Appellant's Narrative, p. 117.) The decree was entered on June 18, 1923, appeal was allowed and the injunction suspended pending the appeal, and

* Owing to the length of the record, upwards of five thousand pages, appellant has filed, (as an appendix hereto), a condensation wherein is stated narratively the pleadings and evidence conceived by appellant's counsel to be material to either party, and it is entitled "Appellant's Narrative Statement of Pleadings, Facts and Evidence". For amplification of the facts stated herein, we will refer to this condensation as "Appellant's Narrative". Beginning with July 1, 1924, appellant furnished appellee's counsel with galley proofs of said narrative statement as it was being prepared, the final proofs being delivered about August 23d last, with request that any inaccuracies in the narrative occurring to appellee's counsel, should be indicated. At the time of filing this brief, no objections have been made to appellant by appellee.

the record was filed herein within the required time. The decree holds unconstitutional Section 20 of the Act of May 29, 1889, in force July 1, 1889, of the State of Illinois under which the appellant was organized and exists (Appellant's Narrative, p. 71), in that it limits the withdrawal of water from Lake Michigan for sanitary purposes to less than half what is prescribed by Section 20 of said Act, namely 20,000 cubic feet per minute for each 100,000 of the population within the territorial limits of the Sanitary District—upwards of 3,000,000 people. Thus, when the decree was entered, appellant was required by the Illinois Act to abstract from Lake Michigan 600,000 cubic feet of water per minute or 10,000 per second.

The decree also held it within the power of the Secretary of War, under Section 10 (this Brief, p. 108) of the Rivers and Harbors Act of March 3, 1899, to regulate the action of the State of Illinois taken pursuant to its police power, and thus the interpretation of the commerce clause of the Constitution is involved in this appeal.

There were two suits—a bill of complaint filed on March 23, 1908, and a complaint filed October 6, 1913. The first action was consolidated with the second one. (Appellant's Narrative, p. 113.)

The suit instituted March 23, 1908, involved the abstraction or diversion of water through an adjunct to the main diversion canal (called the Sanitary and Ship Canal or Main Channel). This adjunct is called the Calumet Sag Channel, and at the time the suit was instituted construction work had just been commenced. It was laid out to extend from the Little Calumet River westerly to appellant's main channel. It was designed to reverse the Calumet River and furnish an outlet for the drainage and sewage of the extreme southern area of appellant, namely that portion of Chicago lying south of 87th street and other territory lying south of the limits of the City of Chicago. It involved no other of ap-

---

NOTE: The volume of water mentioned as per minute or per second indicates the amount flowing past a given point each second or each minute.

pellant's diversion works. However, the complaint filed October 6, 1913, not only involved all diversions of the Sanitary District, including that through its Main Channel and the Chicago River, but also the diversion by means of the Calumet Sag Channel covered by the first suit instituted, so that it is unnecessary to further consider the bill of complaint filed March 23, 1908.

The complaint in the second suit merely set up the organization of appellant in 1889 under an Act of the Illinois General Assembly passed May 29, 1889; the fact that it was diverting more water from Lake Michigan than appellee claimed was authorized by the Secretary of War, that the diversion would lower the levels of all the Great Lakes (except Lake Superior) and their connecting waters, and would thereby prevent boats carrying the cargo that they might have carried without the diversion; that such diversion was therefore a material injury to navigation. The complaint prayed that the appellant be enjoined from abstracting from Lake Michigan by means of its various diversion works, any waters in excess of 4,167 cubic seconds feet, the amount which appellee alleged the Secretary of War, had limited the abstraction under Section 10 of the Rivers and Harbors Act of March 3, 1899. (Appellant's Narrative, p. 21.)

The complaint was filed by the authority of the Attorney General, under Section 12 of the Rivers and Harbors Act of March 3, 1899, providing that *structures erected* in violation of Sections 9 and 10 *might be removed* by injunction instituted by the Attorney General (this Brief p. 108). It will be noted that this suit does not seek the removal of a *structure*.

Appellant's answer denied any injury to commerce or to navigation, and that there was any limitation of withdrawal made by the Secretary of War. It set up that there was an overruling necessity for such diversion, and various affirmative facts of defense—among others, that Congress had authorized the diversion across the Continental Divide by the Act of March 2, 1827, providing for the construction of the Illi-

nois and Michigan Canal from the southern end of Lake Michigan to the Illinois River; and that appellee had invited and acquiesced in appellant's course and it was thus estopped to deny appellant's right. (Appellant's Narrative, p. 39, *et seq.*)

It is unnecessary to further describe the pleadings, as there is no question of pleading involved, and the various issues of fact will appear in the succeeding portion of the statement of the case.

NOTE: There is no dispute as to any facts in the record except concerning the theoretical effect of appellant's diversion upon the surfaces of the Great Lakes, except Lake Superior, and appellee's claimed damage to commerce upon the Great Lakes. On other subjects appellee offered no evidence.

DESCRIPTION OF APPELLANT'S SANITARY & SHIP CANAL AND OTHER SUPPLEMENTARY DIVERSION WORKS.

Appearing in appellant's narrative (opposite p. 187) is a map entitled "Sanitary District of Chicago Map, showing right of way in Cook, Du Page and Will Counties". The map shows the territorial limits of the Sanitary District, the location of its various works completed in the beginning of the year 1914 and others, then, in process of construction. The completed channels, intercepting sewers, etc., are shown by yellow lines; the works in process of construction by red lines; the portion of the map appearing in dark red represents the original territorial limits of the Sanitary District as it was organized and laid out in the year 1889. The portions of the map colored yellow show the additional territory annexed by later acts. The entire territory of appellant contained 386.2 square miles, with a population at the time the decree was entered in this case, of approximately 3,300,000 people.

Lake Michigan is the only water supply for Chicago and its environs.

The underlying feature of appellant's works, from a sanitary standpoint, is the diversion at all times from Lake Michigan, of all sewage and drainage, so that this water supply will not at any time be or become polluted by the filth of this great metropolitan drainage area. This necessitated principally the construction of a canal and adjuncts of such size as to at all times keep reversed and flowing away from Lake Michigan, the Chicago River, its south branch and west fork. This principal canal, known as the Sanitary & Ship Canal, extends from the West Fork of the South Branch of the Chicago River at or near Robey street, upwards of twenty-eight miles, to a point just north of Joliet, where it empties into the DesPlaines River. Movable dams are located at its southern terminus by which the flow through it and appellant's

other diversion works may be at all times controlled. Its constructed capacity in the rock section, which is the southern portion of the Canal, is 14,000 cubic seconds feet of water. (Appellant's Narrative, p. 295.) Section 23 of the Sanitary District Act, provided that it should have a capacity in the rock section of not less than 10,000 cubic seconds feet of water. (Appellant's Narrative, p. 72.) This was and is the maximum or flood run-off of the Chicago River Drainage Area. (Appellant's Narrative, pp. 278, 279, 189.) If the capacity of the Main Channel were less than 10,000 cubic seconds feet, the Chicago River would at times flow into Lake Michigan, polluting the water supply.

Section 23 of the Act further provided that the Canal should be not less than 18 feet in depth and that it should not have a current greater than three miles per hour, all in order to provide proper navigation facilities thereon. The Channel is in the rock section 160 feet wide and in the earth section upwards of 200 feet, with a depth of 26 feet at all points. (Appellant's Narrative, p. 180.) Construction of the Channel was begun in 1890 by the making of surveys, and in 1893 by actual excavation. It was completed in 1898 and opened January 17, 1900, and since that time has been continuously operated. (Appellant's Narrative, pp. 288, 293.)

The Chicago River proper is very short, and extends from Lake Michigan approximately one mile, to the junction of the North and South branches of the Chicago River. The South Branch extends for some miles in a south and southwesterly direction, to the junction of the West Fork and South Fork of the South Branch. It is some distance on the West Fork southwesterly to the junction with it of the northern terminus of the Sanitary & Ship Canal just described.

At the time the Sanitary & Ship Canal was constructed, the South Branch and its West Fork were narrow, shallow and tortuous, so that it was necessary for the appellant to enter upon, use, widen and deepen, under Section 17 of the Sanitary District Act (Appellant's Narrative, p. 394) the

channels of these rivers, in order that they should become a supply channel by which the waters of Lake Michigan could be withdrawn through them to the Sanitary & Ship Canal. (Appellant's Narrative, p. 294.)

Consequently, beginning with the year 1896, the Sanitary District deepened, widened and straightened the channels of the South Branch and West Fork so that they have a capacity of withdrawing through them from Lake Michigan, water to the extent of 10,000 cubic seconds feet without creating a current injurious to navigation. The appellant deepened the channels of these rivers from 17 feet to 26 feet throughout, and widened them at all points to 200 feet; replaced old center pier bridges with modern bascules, so that at the bridge sites a current injurious to navigation would not exist with the added water, and the bridge openings would be large enough to permit the easy passage of boats. (Appellant's Narrative, p. 394.) The work of deepening and widening the channels of these rivers and the construction of the bridges, was all done with the consent of the Secretary of War under the various Rivers and Harbors Acts existing at the time the work was done, and at a cost to appellant of upwards of $10,500,000. (Appellant's Narrative, p. 296.)

This river improvement work may be properly divided into two periods—the work done prior to the opening of the Sanitary & Ship Canal on January 17, 1900, and the work done after that date. In the first period it was only necessary to improve the channels of the rivers, the West Fork and South Branch, to provide for the initial operation of the Sanitary and Ship Canal, which would then require a flow through it of waters from Lake Michigan of only 300,000 cubic feet per minute, as the population of the Sanitary District then was only approximately one and a half million people, all as is provided by Section 20 of the Act under which appellant exists. (Appellant's Narrative, p. 294.)

The authority of the Secretary of War for the work of excavating, etc., in improving the channels of the West Fork and the South Branch of the Chicago River during the first

period, 1896 to January 17, 1900, was represented by various permits then issued for specific work done from time to time. His consent for the improvement of the channels of these rivers, made after 1900, is represented by two permits issued on July 11, 1900, describing the proposed comprehensive improvement in these channels in order to provide for the withdrawal of at least 10,000 seconds feet of water from Lake Michigan through these channels to the Sanitary & Ship Canal. The work described by these permits and in the applications therefor made by the Sanitary District, provide for the deepening of the channels of these rivers from 17 to 26 feet, and widening at all points to 200 feet, including the work of reconstructing bridges to suit this improvement. (Appellant's Narrative, p. 90, 91.) The channel of the Chicago River itself was deepened by the United States, as the deepening and widening of the channels of the West Fork and South Branch of the Chicago River progressed, as above described. (Appellant's Narrative, p. 185.)

May 8, 1899, the Secretary of War issued a permit authorizing appellant to open its Sanitary and Ship Canal. The amount of water to be withdrawn through it was limited only by two conditions material here: (1) if Congress should act and specifically legislate, then the permit was to be null and void; (2) the Secretary of War might limit the flow through the Chicago River in the event a current was created therein unreasonably obstructive to navigation on the Chicago River, the Chicago River being then only 17 feet deep and narrow, and having obstructive bridges across it. (Appellant's Narrative, p. 21.)

Prior to the deepening and widening of the channels of the Chicago River, its South Branch and the West Fork of the South Branch, under the permits of July 11, 1900, (Appellant's Narrative, p. 92) the Secretary of War issued orders to limit, solely because of the current in the channels of those rivers, the diversion from Lake Michigan, (finally, on December 5, 1901), to 4,167 seconds feet. (Appellant's Narrative, p. 24.) Thereafter the river was deepened to 26

feet at all points and widened to 200 feet, pursuant to said permits of July 11, 1900, and bridges necessary for the improved channels were constructed. The Secretary of War has since refused to remove this limitation, notwithstanding the completion of the improvements of the channels of the Chicago River, its South Branch and the West Fork of the South Branch, and it is upon the limitation of the Secretary of War of December 5, 1901, that this litigation is founded. (Appellant's Narrative, p. 28.)

The sewer system of Chicago was constructed so that most of the sewers emptied into the Chicago River, its North and South Branches, the West Fork and South Fork of the South Branch. Some, however, debouched their sewage directly into Lake Michigan. (Appellant's Narrative, p. 178.) Consequently, large intercepting sewers were constructed along the shore of Lake Michigan to pick up the sewers emptying directly into Lake Michigan and by large conduits to divert this sewage to the DesPlaines River by means of the Sanitary & Ship Canal. On the south side of the city, as is shown by the map above described (Appellant's Narrative opposite p. 187), the interceptors converged at 39th Street and the sewage is there pumped, together with a certain amount of lake water, through the 39th Street Conduit into the East Arm of the South Fork of the South Branch of the Chicago River, whereupon it finds its way through the South Fork to the West Fork, and thence into the Sanitary & Ship Canal. The maximum capacity of the 39th Street Conduit, including sewage, is 2,000 cubic feet per second. The intercepting sewers on the North Side converge at Lawrence Avenue Pumping Station, and the sewage is pumped, together with a certain amount of water from Lake Michigan for dilution purposes, to the North Branch of the Chicago River, whereupon it finds its way through the North Branch to the South Branch of the Chicago River, and thence by its West Fork to the Main Channel. The maximum capacity of the Lawrence Avenue Conduit and Pumping Station is 40,000 cubic feet of water per minute, including sewage. (Appellant's Narrative, p.

191.) The North and South Side Intercepting Sewer Systems with pumping stations described, were completed about the year 1907 and thereby with the operation of the Sanitary & Ship Canal practically all the sewage and drainage arising in the original limits of appellant, was diverted from the water supply through the Sanitary & Ship Canal to the DesPlaines and Illinois Rivers. (Appellant's Narrative, p. 203.)

To further complete this drainage system and thereby protect the water supply of the inhabitants of Chicago and its environs, on May 14, 1903, an Act was passed by the General Assembly of Illinois (Appellant's Narrative, p. 76) providing for the annexation of territory north of the City of Chicago covering what may be called the North Shore Suburbs, including Evanston, Wilmette, Kenilworth, Winnetka, Glencoe, Hubbard Woods and others. The Act also provided for the annexation of territory to the south of the southern limits of the Sanitary District, or 87th Street of the City of Chicago, which includes what is known as the Calumet District, extending east to the Indiana State line. Under this Act, appellant was authorized to construct adjuncts, canals and other works necessary to furnish an outlet for the drainage of the added territory, cut through and destroy that portion of the Illinois & Michigan Canal, which parallels the Sanitary & Ship Canal to the DesPlaines River at or near Joliet. What is known as the North Shore Channel, extending from the North Branch of the Chicago River at or near Lawrence Avenue in the City of Chicago north to the shore of Lake Michigan at Wilmette, just north of Evanston, was constructed and placed in operation in the year 1910. The capacity of this channel is 1,000 cubic feet per second, and water is taken through it from Lake Michigan to dilute the sewage of the North Shore Suburbs as well as to furnish additional dilution water for the sewage entering the North Branch at various points. (Appellant's Narrative, p. 183.)

In connection with the North Shore Channel, intercepting sewers were constructed to divert the sewage of the North Shore Suburbs. The North Branch of the Chicago River

was straightened, widened and deepened to carry the additional water, and also to provide a navigable waterway all the way from the North Branch's junction with the Chicago River and its South Branch North to Wilmette, where a lock is provided for boats to pass from the North Shore Channel to Lake Michigan. This improvement was all done with the consent of the Secretary of War. (Appellant's Narrative, p. 183.)

To provide an outlet for the sewage and drainage of the Calumet District, immediately after the passage of said Act of May 14, 1903, the appellant laid out a right of way for and entered upon the construction of the Calumet Sag Channel (Appellant's Narrative, p. 6.) When the first bill of complainant was filed, namely, March 23, 1908, work on this canal was stopped and was not resumed until after June 30, 1910, when The Sanitary District obtained, from the Secretary of War, a permit to reverse the flow of the Calumet and Little Calumet Rivers. The permit was subject to the condition that there should not be diverted from Lake Michigan, by means of said channel, water in addition to what the appellant had the right to divert through its main channel, the Chicago River and its branches. (Appellant's Narrative, p. 82.) This channel extends from the Little Calumet River at or near Blue Island, westerly to a point at or near Sag, Illinois, on the Sanitary and Ship Canal. The capacity of this channel as it is now constructed, is approximately 2,000 cubic feet per second. There have been constructed intercepting sewers converging at or near the easterly terminus of said channel to divert all the sewage of the Calumet District so that no sewage will flow into the Calumet River or its branches within the State of Illinois. This channel, completed in the year 1922, reverses at practically all times the flow of the Calumet and Little Calumet Rivers. (Appellant's Narrative, p. 188.)

The Calumet Sag Channel is upward of 18 feet deep and over 60 feet wide, and at certain points is wider to provide for boats meeting or passing one another. It is designed for

further widening to provide a maximum capacity of 4,000 cubic seconds feet. (Appellant's Narrative, p. 188.)

The Sanitary & Ship Canal is wide enough and deep enough and the current therein is proper to permit the largest boats navigating the Great Lakes to pass through it to its southern terminus. All bridges over this channel have been so constructed that they may be moved, raised or lifted to leave the channel entirely unobstructed for navigation. This includes highway as well as railroad bridges. The Calumet Sag Channel, the North Shore Channel and all other improvements in rivers made by appellant, have been constructed or made so that all boats navigating the Illinois & Michigan Canal may pass through such canals or rivers without hindrance. (Appellant's Narrative, p. 188.) All this is pursuant to and under the express direction of the statute under which appellant exists, and to carry out the second great purpose of appellant's diversion works.

The cost of constructing the Sanitary and Ship Canal to provide navigation facilities over what it would have cost had it been built merely for the diversion of drainage and sewage with the statutory amount of water from Lake Michigan for dilution purposes is many millions of dollars. (Appellant's Narrative, 392.)

Section 7 of the Act under which the Sanitary District exists (Appellant's Narrative, p. 69) provides for appellant's owning dock property and leasing same along its right of way, in order that manufacturing or other establishments might locate there on water transportation. There was also constructed by appellant at the southern terminus of its main channel, for navigation purposes, a lock of sufficient size to permit the passage of boats to and from the Sanitary & Ship Canal into the DesPlaines River. The DesPlaines River was deepened and widened to connect navigation on the Sanitary & Ship Canal with the upper basin of the Illinois & Michigan Canal. (Appellant's Narrative, p. 181.) The Illinois & Michigan Canal between its Upper Basin at Joliet and Chicago, has not been used for years and navigation from Joliet to

Chicago has been carried on over the Sanitary & Ship Canal. (Appellant's Narrative, p. 296.) At the southern terminus of the Sanitary & Ship Canal, sufficient property has been reserved and set aside by appellant as a site for a lock upon which one may be built large enough to permit the passage of any boats capable of navigating the Sanitary & Ship Canal from it to the DesPlaines River below. (Appellant's Narrative, p. 297.)

At the southern terminus of the Sanitary & Ship Canal, at or near Joliet, there is a drop between the surface elevation of water in the Canal and the surface elevation of the water in the DesPlaines River just below, of approximately 34 feet. In order to utilize the potential water power existing, the original act of May 29, 1889, under which the Sanitary District was organized and now exists, authorized, and the Act of May 14, 1903, more expressly authorized, appellant to install such machinery as was necessary to convert the water power energy there into electricity. It was also empowered to use such of it as was necessary for its various pumping works and to sell the same primarily to municipalities, parks and districts within appellant's limits. (Appellant's Narrative, p. 78.) Consequently, in the latter part of the year 1907, this hydro-electric plant was completed and placed in operation. No water, however, has ever been diverted from Lake Michigan for the development of water power, and only the water that has been diverted for sanitary and navigation purposes has been so used. (Appellant's Narrative, p. 181.)

The diversion works and drainage and sewage outlets above described of the appellant thus provide for the diversion of a total of 12,000 cubic feet per second from Lake Michigan, and when the Calumet Sag Channel is fully completed, an additional 2,000 cubic seconds feet may be diverted through it, making a total of 14,000 cubic seconds feet, the original constructed capacity of the rock section of the Sanitary & Ship Canal. This diversion is accomplished as follows: Six thousand two hundred fifty seconds feet is drawn from Lake

Michigan through the Chicago River proper, to the junction of its North and South Branches. It is there augmented by 1,750 seconds feet, 750 from the Lawrence Avenue Conduit and Pumping Station, and 1,000 from Lake Michigan by means of the North Shore Channel; 8,000 cubic seconds feet thus flows through the South Branch of the Chicago River, to its junction with the West Fork and South Fork. This amount is augmented there by the 2,000 seconds feet coming from the 39th Street Pumping Station and Conduit to the West Arm of the South Fork of the South Branch. From the junction of the South Fork of the South Branch and the West Fork of the South Branch, there flows through the West Fork to the Northern Terminus of the Sanitary & Ship Canal at Robey Street and the West Fork, and thence through the Sanitary & Ship Canal to Sag, Illinois, 10,000 cubic seconds feet. At this point the Calumet Sag Channel enters with its flow of 2,000 cubic seconds feet of water, to be increased later by an equal amount. Thence the water flows or will flow in the amounts mentioned to the Southern Terminus of the Canal at or near Joliet, where it enters the DesPlaines River, and proceeds on its way to the Gulf of Mexico. (Appellant's Narrative, p. 191.)

The total cost of all these diversion works is approximately $75,000,000, and in addition there was expended $5,000,000 in the hydro-electric development at the southern terminus of the Sanitary & Ship Canal. (Appellant's Narrative, p. 194.)

ACTION OF THE STATE AND FEDERAL GOVERNMENTS CONCERNING THE DIVERSION OF WATER FROM LAKE MICHIGAN AT CHICAGO.

Waterway from Lake Michigan to the Gulf of Mexico.

The diversion of water across the Continental Divide or that small elevation of land which within a few miles of Chicago represents the division between the Great Lakes Basin, and the Mississippi River Basin, has been the subject of action of the State and Federal Governments substantially since Illinois became a member of the Union in the year 1818. Since the very earliest discovery by Joliet and Marquette of the Illinois River Basin in 1673, and thereafter, a water route has existed from the lower end of Lake Michigan through the Chicago River, its South Branch and the West Fork of the South Branch, and from there through Mud Lake to the DesPlaines River and thence to the Illinois. (Appellant's Narrative, p. 400.) This water route was used by the early explorers. adventurers and fur traders until about the year 1830. (Appellant's Narrative, p. 400.)

The DesPlaines River, rising in the State of Wisconsin, flows south to within ten miles of Lake Michigan at Chicago, near the source of the West Fork of the South Branch, then it veers southwesterly to a point where it forms a junction with the Kankakee River, creating the Illinois River. (Appellant's Narrative, p. 407.)

In times of high water, and during a large portion of the year, water flowed across the Continental Divide from the DesPlaines to the West Fork of the South Branch of the Chicago River. Likewise water flowed from the West Fork of the South Branch of the Chicago River to the DesPlaines River. Boats in these high water times could pass from the West Fork of the South Branch to the DesPlaines River, and vice versa. (Appellant's Narrative, p. 408.) In times of low water, there existed a portage whereby boats passed to and fro along this water route.(Appellant's Narrative, p. 407.)

The water route was described in the early reports made by Secretary of War John C. Calhoun to Congress. (Appellant's Narrative, p. 407.) The Enabling Act to permit the Illinois Territory to organize as a state, was amended in 1818 to include a coast on Lake Michigan, being the port of Chicago and extending to the present boundary between Illinois and Wisconsin. This water route and its probable improvement and enlargement, was stated to be, by Mr. Pope, in submitting the amendment, the reason for the addition of the coast of Lake Michigan to the Illinois territory. (Appellant's Narrative, p. 405.) The water route was recognized in the Treaty of Peace made by Major General Anthony Wayne in 1795, known as the Treaty of Greenville, and in the Treaty of 1816 with the Ottawas. (Appellant's Narrative, p. 408.)

The necessity of enlarging and improving the waterway was emphasized by reason of the refusal of the Government of Great Britain to permit the citizens of the United States free navigation on the St. Lawrence River. This refusal first took form in Acts of Parliament of 1822 and 1824. It was the subject of diplomatic exchanges in those years, also in the year 1827. These negotiations continued, until the year 1854, when a Treaty was made with Great Britain which gave to the citizens merely the privilege, but not the right of free navigation on the St. Lawrence River. (Appellant's Narrative, p. 409.)

March 30, 1822, Congress passed an act entitled "An Act to authorize the State of Illinois to open a canal through the public lands to connect the Illinois River with Lake Michigan." A portion of said Act is as follows:

> "That the State of Illinois be, and is hereby authorized to survey and mark through the public lands of the United States, the route of the Canal connecting the Illinois River with the southern bend of Lake Michigan; and ninety feet of land on each side of said canal shall be forever reserved from any sale to be made by the United States." (3 U. S. Stat. at large 659. Appellant's Narrative, p. 410.)

By reason of the failure of the State within three years from its passage to perform certain conditions, the Act ceased to have force or effect. Thereafter the General Assembly of Illinois memorialized Congress, setting forth the necessity of the passage of another act looking to the establishment of a canal from Lake Michigan to the Illinois River. Among other things, the Memorial stated:

> "That the construction of a canal uniting the waters of Lake Michigan with the Illinois River, will form an important addition to the Great Connecting Links in the chain of internal navigation which will effectually secure the indissoluble union of the confederate members of this great and powerful Republic." (Appellant's Narrative, p. 411.)

On March 2, 1827, Congress passed another act which has remained in force from and after its passage, and it still exists unrepealed, entitled "An Act to grant a quantity of land to the State of Illinois for the purpose of aiding in opening a canal to connect the waters of the Illinois River with those of Lake Michigan." Said Act, among other things, provided:

> "That there be and hereby is granted to the State of Illinois, for the purpose of aiding the said State in opening a canal to unite the waters of the Illinois River with those of Lake Michigan, a quantity of land equal to one-half of five sections in width, on each side of said canal, and reserving each alternate section to the United States, to be selected by the Commissioner of the Land Office, under the direction of the President of the United States, from one end of the said canal to the other; and the said land shall be subject to the disposal of the Legislature of the said State, for the purpose aforesaid, and no other; provided, that the said canal when completed shall be and forever remain a public highway for the use of the Government of the United States, free from any toll, or other charge, whatever, for any property of the United States, or persons in their service passing through same; * * *" (4 U. S. Stat. at large 234. Appellant's Narrative, p. 412.)

January 9, 1836, the General Assembly of Illinois passed an act under which the Illinois and Michigan Canal was con-

structed. Section 16 of this Act prescribed the initial width to be not less than 45 feet, and fixed its depth, and

> "to be supplied with water from Lake Michigan and such other sources as the Canal Commissioners may think proper".

The Act reserved 90 feet on each side of the canal to enlarge its capacity whenever the public good should require. (Appellant's Narrative, p. 412.)

The original plan of the canal provided for its construction from Chicago to Joliet in such way that water should be taken through it from the West Fork of the South Branch of the Chicago River and from Lake Michigan by gravity. However, lack of funds prevented its completion on this plan, known as the Deep Cut Plan, and it was completed in 1848 upon the Shallow Cut Plan, whereby water was obtained for its operation from the West Fork of the South Branch of the Chicago River by means of pumps at its Northern Terminus, and by a feeder extending from the canal at Sag, Illinois, to the Little Calumet River, substantially on the site of the present Calumet Sag Channel of appellant above described. (Appellant's Narrative, p. 413.)

For the purpose of further enlarging the Canal and to provide greater depths of water in the Illinois River below the Canal's Southern Terminus, the General Assembly of Illinois in 1861 directed that a survey be made of the Illinois River and Illinois and Michigan Canal, portions of the Des Plaines and Chicago Rivers

> "of the different methods proposed or desirable for improving the navigation of the Illinois River, by dredging or excavation of the channel and wing dams, or by supplying water from Lake Michigan, through the enlargement and deepening of the Illinois and Michigan Canal, or otherwise, or by opening a channel from Lake Michigan by way of the South Branch of the Chicago River and Mud Lake to the DesPlaines River and down said Canal to a point that would secure a free, flowing, ample and never failing supply of water, sufficient for navigation of the Illinois River at all seasons and times, * * * and to include also an estimate for the channel herein-

before mentioned, of sufficient size to admit of full and free steam-boat navigation from the Illinois River to Chicago and Lake Michigan, as well as a size sufficient for supplying water for all the deficiencies of navigation in the Illinois River, at all seasons. * * *" (Appellant's Narrative, p. 415.)

February 12, 1867, pursuant to the Act of Congress of June 23, 1866, Major General Wilson reported to the Chief of Engineers upon a survey for the improvement of this waterway along the lines of the resolution of the General Assembly of Illinois of 1861, above mentioned. Among other things, the report stated:

"The Illinois River seems to have been especially designed by nature as the link by which the waters of Lake Michigan are to be connected with those of the Mississippi. * * * the data herein contained, together with the existence of a canal of limited capacity already in operation, demonstrate beyond a doubt that the waters of the Lake may be carried into the Illinois River through a navigable channel of any required dimensions, and at a cost which cannot be regarded as excessive when the objects to be obtained are duly considered. * * * The summit will be inexhaustible, and this cannot be said of any other practicable line of water communication between Lake Michigan and the Mississippi River." (Appellant's Narrative, p. 418.)

January 9, 1875, Major F. C. Doran reported upon a survey of this waterway to the Chief of Engineers, U. S. Army, in which, among other things, it was stated:

"The improvement of the eastern portion of the Illinois and Michigan Canal involves the further cutting down of the summit level and enlarging the waterway so as to afford an unfailing supply of water from Lake Michigan for the improved Illinois River." (Appellant's Narrative, p. 419.)

This canal (summit level) had just then been (1871) deepened to conform to the deep cut plan.

Under the Rivers and Harbors Act of March 3, 1879, Major Lydecker made a report to the Chief of Engineers, which was transmitted to Congress, concerning a survey for the

improvement of this waterway. The report made May 18, 1880, reviewed the history of the development of this waterway, and reports heretofore mentioned as to improvements, and further stated:

> "* * * It seems only necessary to note that the improvement of the Illinois River, supplemented by the enlargement of the Illinois and Michigan Canal, as heretofore proposed, will furnish a reliable and commodious channel of water communication from the Mississippi River to the Northwestern Lakes; by this means the vast Mississippi Valley, and all the country tributary thereto, is brought into direct water communication with Lake Michigan, at the Great City of Chicago, with its flood of commerce eastward and westward. The route exists as a practicable one of considerable importance today, and the question is simply one of enhancing its value by increasing its capacity to a degree commensurate with the important interests involved. * * * Considering this simple statement, the facts so fully set forth in previous elaborate reports, and knowing the wonderfully rapid development of the entire western country, it would seem that nothing further is necessary to indicate 'to what extent the general commerce of the country will be promoted' by the contemplated improvement, nor to show how desirable it is that the work should be accomplished with the least delay practicable." (Appellant's Narrative, p. 421.)

Pursuant to the Rivers and Harbors Act of August 2, 1882, Major W. H. H. Benyaurd made two reports, one dated September 2, 1882, and the other March 5, 1884. In the latter report, it was stated:

> "that with the improvement of the River now in question carried on, navigation will be brought to within thirty-three miles of the Lake, and this stretch can be opened by improving the DesPlaines higher up and by enlarging the present Illinois and Michigan Canal".

(Appellant's Narrative, p. 444.)

By the Rivers and Harbors Act of August 5, 1886, Congress provided for a survey of this water route and the improvement thereof which was made by Major Handbury in 1887, and the report of said survey among other things stated:

> "The United States and the State of Illinois have long been committed to the project of opening a water com-

munication between the Mississippi River and the Northern Lakes of capacity sufficient for the wants of commerce and for the exigencies of our national defense, should these ever arise. * * * Besides the immense commercial advantages that may be expected from the completion of the project, there are military and naval exigencies that might easily arise where it would figure as a prominent factor in the problem of our national defenses. From whatever point we look at the subject, there is nothing local or sectional in it. It is true that all the work to be done happens to be in the State of Illinois. The benefits to be derived belong to the nation at large. It is fortunate, too, that at this time the subject is unencumbered by any phase of a political character. The problem of connecting Lake Michigan with the Mississippi River by a commodious waterway that could be used for commercial, military and naval purposes, has received attention from our most thoughtful statesmen from the day of Albert Gallatin to the present." (Appellant's Narrative, p. 445.)

On May 28, 1889, the General Assembly of Illinois adopted a resolution expressing the waterway policy of the State, and asking cooperation of the Federal Government:

"Whereas, it is contemplated to increase the volume from Lake Michigan to 300,000 cubic feet per minute within a few years, and ultimately to add 600,000 cubic feet or more, thus enabling a large depth for navigation to be obtained by an improved channel, and that said channel will be self-sustaining and self-improving, and will discharge flood waters more readily, thus benefitting the bordering lands and increasing the healthfulness of the valleys;

"Whereas, works now projected by the City of Chicago will form part of a waterway of large proportions from Lake Michigan via the DesPlaines and Illinois Rivers to the Mississippi River; * * *

"Therefore, be it resolved * * *

(1) That it is the policy of the State of Illinois to procure the construction of a waterway of the greatest practicable depth and usefulness for navigation from Lake Michigan via the DesPlaines and Illinois Rivers to the Mississippi River, and to encourage the construction of feeders thereto of like proportions and usefulness. * * *

* * *

(3) That the United States is requested to aid in the construction of a channel not less than 160 feet wide and 22 feet deep, with such a grade as to give a velocity of three miles per hour from Lake Michigan at Chicago to Lake Joliet, a pool of the DesPlaines River, immediately below Joliet, and to project a channel of similar capacity and not less than fourteen feet deep from Lake Joliet to LaSalle, all to be designed in such manner as to permit future development to a greater capacity". (Appellant's Narrative, p. 448.)

The above resolution was adopted the day before the act, under which appellant was organized and exists, was passed by the General Assembly of Illinois. This act provided for three uses of the diversion: (1) Sanitary—to prevent the water supply of Chicago and its environs from being polluted by sewage or drainage; (2) Navigation—the diversion channels and canals to be constructed of such size and depth as to provide easy transportation for boats engaged in commerce, state and interstate, greater depths in the DesPlaines and Illinois Rivers for navigation, removal of all dams in the Illinois River to provide a free passage for boats; (3) Incidental to the two principal uses, development of water power and use of right of way along diversion channels or canals for docks, thus providing an inner harbor for navigation.

We will now trace and describe the things done by Illinois and the City of Chicago to the date of the passage of the act under which appellant was organized and now exists—May 29, 1889—in the diversion of waters of Lake Michigan through the Illinois and Michigan Canal for sanitary purposes.

In 1863 an erysipelas epidemic broke out in Chicago, along the South Branch of the Chicago River. Thereupon, in cooperation with the trustees of the Illinois and Michigan Canal, the City of Chicago provided for the operation of the Bridgeport Pumping Station at the northern terminus of the Illinois and Michigan Canal, to pump more water through the Illinois and Michigan Canal from the West Fork of the South Branch of the Chicago River, the South Branch of the Chi-

cago River, the Chicago River itself, and from Lake Michigan, to cleanse those rivers. (Appellant's Narrative, p. 270.)

April 16, 1865, the General Assembly of Illinois authorized the City of Chicago, at its expense, to complete the Illinois and Michigan Canal from Chicago to Joliet upon the original Deep Cut Plan, whereby more water would be withdrawn from Lake Michigan through the Chicago River and its branches by gravity, one of the preambles to said act being as follows:

> "Whereas, it has been represented that the City of Chicago, in order to purify or cleanse Chicago River, by drawing sufficient quantity of water from Lake Michigan, directly through it, and through the summit division of the Illinois and Michigan Canal, would advance a sufficient amount of funds to accomplish this desirable object." (Appellant's Narrative, p. 417.)

Pursuant to this act, the Illinois and Michigan Canal was completed in 1871 on the Deep Cut Plan at an expense of upwards of $3,000,000, and thereafter more water was drawn through it from Lake Michigan—upwards of 40,000 cubic feet per minute. (Appellants' Narrative, p. 419.)

In 1881 the City of Chicago having greatly increased in population, the Chicago River having become badly polluted, contaminating the Lake Michigan water supply, the General Assembly of Illinois by resolution authorized the City of Chicago to install pumps at the northern terminus of the Illinois and Michigan Canal to withdraw from Lake Michigan through it, not less than 60,000 cubic feet of water per minute. (Appellant's Narrative, p. 49.)

These pumps were installed in 1884. The installation of the pumps, however, did not relieve pollution of the Chicago River and the water supply. A great flood in 1885 caused great quantities of filth to be carried out into Lake Michigan, further polluting the water supply. (Appellant's Narrative, p. 274.)

As a result, typhoid fever epidemics existed. The people of Chicago and vicinity became aroused concerning the danger

to health (Appellant's Narrative, p. 274.) Whereupon, January 27, 1886, a resolution passed the City Council of Chicago, authorizing the appointment by the Mayor of a Commission of Engineers, to be known as the **Drainage and Water Supply Commission.** The resolution stated the duties of this Commission to be—

> "to consider all plans relating to drainage and water supply which may be brought to its attention; to make such examinations and investigations and surveys as may be deemed necessary; to collect all information bearing on this problem; to consider all recent developments in the matter of sewage disposal and their application to our present and future needs; to consider and meet necessity of increasing our water supply and of protecting the same from contamination; to remedy our present inadequate methods of drainage and sewage disposal; to consider the relation of any system proposed to adjacent districts and whether there may not be a union between the city and its suburbs to solve the great problem; to determine the great question as to the interest which the State and the United States may have in the disposal of sewage by way of the Illinois River, and to devise plans to meet any objections thereto, if such a system shall be thought best; and in general to consider and report upon any and all things which relate to the matter of water supply and drainage of the City of Chicago." (Appellant's Narrative 424.)

The Commission was further instructed by the resolution to report in a comprehensive manner upon all phases of the question and *"not later than the convening of the next session of the Illinois Legislature in January,* 1887."

Accordingly, pursuant to the resolution of the City Council of Chicago, the Mayor appointed three eminent engineers of national standing—Rudolph Hering, as Chief Engineer, Benzette Williams and S. G. Artingsall as consulting engineers. The report of the Drainage and Water Supply Commission was made January 30, 1887, to the Mayor and City Council of Chicago, and a copy of the resolution under which the Commission was appointed, appears in said report.

The Commission made an examination and investigation of the entire subject, and among other things stated, reported and concluded as follows (Appellant's Narrative, p. 427):

"The examination disclosed the fact that the city is sometimes greatly suffering from the offensive condition of parts of the Chicago river and its branches, caused by the discharge of sewage into the same, and from the occasional contamination of its water supply, brought about by the discharge of the polluted contents of the river into the lake. It also disclosed the fact that almost every conceivable way of dealing with these questions had been suggested, and in some forms applied during the past thirty years.

"The problem therefore demands the attainment of two ends—the protection of the water supply and the removal of the river nuisance. As the water must be taken from the lake, it is evident that both its pollution and the objectionable condition of the rivers should be prevented by a better disposition of the sewage. It is, therefore the latter question which constitutes the main objection of this investigation.

"Among the possible methods of getting rid of the Chicago sewage there are but three that have been deemed worthy of an extended consideration, namely: A discharge into Lake Michigan, a disposal upon land, and a discharge into the DesPlaines River. The preliminary work has, therefore, been confined to these three projects, and was classed as topographic, hydrographic, and miscellaneous."

* * *

"The hydrographic work consisted in ascertaining the flow of the DesPlaines River, the rainfall upon its area, its flood discharges, the character of its bed, and the probable effect of discharging the Chicago sewage into it when diluted by a large and constant stream of water from the lake. It consisted, further, in examining the nature of the currents in the lake and in studying the rise and fall of its level, and in ascertaining the amount and character both of the sewage discharged into it and of the deposits in the river and lake in front of the city to determine the effects of the present sewage disposal.

"Inquiry and surveys were made to show the feasibility of purifying the Chicago sewage by filtration on land."

* * *

"When the sewage works of this city were designed, in 1856, by Mr. E. S. Chesbrough, it was apprehended that ultimately some means would have to be found to change the water in the river from time to time or to keep the sewage entirely out of it. The first steps toward improving the condition of the river was taken by deepening the Illinois and Michigan Canal, so as to cause a current from the lake to the DesPlaines River at Lockport. The next step was the building of the Fullerton avenue conduit in order to produce a circulation in the North Branch; and the last step was the erection of the canal pumping works to increase the flow in the river, which had become greatly polluted."

* * *

"The depth and character of sewage deposits in the river and harbor, as might be expected, vary considerably. They are not great in the track of the vessels, but increase toward the docks and quieter portions of the slips, where they reach a depth of from one to four feet. While the deposits in the channel are of a heavier kind, such as cinders, those in the docks are mostly a foul mass of decomposing organic matter. No form of life is found to exist above Clark street bridge as far north as Clybourn place and as far south as Ashland avenue. The effect of this condition of the river is to endanger the purity of the water supply whenever the river, with its accumulated deposits, flows into the lake, which occurs when the rain water that finds its way into the river exceeds the amount pumped into the canal. If this excess is great, as in the spring and occasionally in the summer months, the contamination of the lake is considerable, and must constantly increase.

"From the foregoing it is seen that the present method of disposal of the sewage from Chicago and its suburbs is partly by discharging it into Lake Michigan, but mainly, except during floods, by discharging it into the DesPlaines River."

* * *

"The growth of Chicago has been frequently quoted as phenomenal."

* * *

"This fact, together with the probable growth of Chicago, shows it to be economical and judicious at present to plan works sufficiently extensive to dispose of the sewage of not less than 2,500,000 inhabitants."

* * *

"A third solution of the drainage problem is rendered practicable by the fact that the divide between Lake Michigan and the Mississippi Valley lies about 10 miles west of Chicago, with so slight an elevation that it is not a difficult matter to carry the sewage from the city westward into the DesPlaines River, and thence into the Mississippi River."

* * *

"The possibility of this solution was recognized as early as 1856 by Mr. E. S. Chesbrough, and the first step towards its adoption was taken, as already mentioned, by turning the sewage into the Illinois and Michigan Canal. Not until quite recently, however, has it become practicable to consider the construction of a special waterway for sewage removal, because when the population was smaller the expense of the undertaking was too great."

* * *

"A second branch of the investigation extends to the elements governing the proper size of the waterway from which a large proportion of the storm water has been excluded. The area still draining into it will consist largely of paved streets and roofs, allowing of no absorption and shedding the water rapidly. It requires a careful consideration to determine the maximum quantity of water that may enter the proposed channel, and for which an ample allowance must be made to prevent a back flow of the polluted water to the lake."

* * *

"The proposed waterway should, of course, provide immunity from offense at all times."

* * *

"A third branch of the inquiry covers the selection of routes for the proposed canals.

"Between Chicago and Summit three lines are practicable—one following the west fork and Ogden ditch, and another extending from the southwestern end of the south fork in a westerly direction to the Ogden ditch, and thence to Summit, and a third being an enlargement of the present canal."

* * *

"For the drainage of the Calumet region a simple inspection shows that a canal should start from the river at the southern point of Blue Island, and extend almost directly westward to the DesPlaines Valley at Sag."

* * *

"In the foregoing we have outlined the main features of the only three feasible methods of disposing of the metropolitan sewage, and have given the results of the investigation reached to date."

* * *

"Besides the economical advantages of the DesPlaines scheme, its superiority is still further emphasized by advantages of another kind. The proposed canal will, from its necessary dimensions and its regular discharge, produce a magnificent waterway between Chicago and the Mississippi River, suitable for navigation of boats having as much as 2,000 tons burden. It will establish an available water power between Lockport and Marseilles fully twice as large as that of the Mississippi River at Minneapolis, which will be of great commercial value to the state. The Calumet region will be much enhanced in value by having a direct navigable channel to the DesPlaines River and by a lowering of the flood heights of Calumet Lake and River. Within the city the water of the Chicago River and its South Branch will get a much better circulation if it flows by gravity than if it has to be pumped, the necessity for which would remain even if the sewage should be discharged through intercepting sewers, either into the lake or upon land. Upon either of the latter conditions an occasional overflow from the sewers into the river during heavy rains would be more objectionable than a constant discharge of sewage into a more rapidly flowing stream. Flood waters entering the lake by way of the Chicago River would carry into it much filthy matter, either suspended or deposited, notwithstanding the existence of intercepting sewers, but the proposed diversion of such waters before reaching the populated districts will for all time obviate this undesirable occurrence."

* * *

"In reaching the conclusion that the sewage of the city should be discharged into the Mississippi Valley the question of water supply is materially simplified, because the lake will then at all times furnish good water wherever intakes are desired for an extension of the works."

The report of the Drainage & Water Supply Commission, above mentioned, was made, as required by the resolution of the City Council of Chicago under which the Commission was established, in time for the session of the General Assembly of Illinois of 1887. While the subject was

considered at this session of the General Assembly and a bill was introduced, it was not passed, and there was constituted a joint committee of the House and Senate to sit *ad interim* to consider the subject matter and future legislation. (Appellant's Narrative, p. 280.) The joint committee was empowered to and did obtain the advice of counsel, and John P. Wilson, late of the Chicago Bar, was one of its legal advisors. (Appellant's Narrative, p. 282.) This committee, reported to the next session of the General Assembly, after making a thorough investigation of various questions involved, and finally, on May 29, 1889, the bill was passed under which appellant was organized and now exists. This act became in force on July 1, 1889.

The Act, hereinafter, for convenience, called "The Sanitary District Act", was a culmination of the efforts of the State and Federal Government to comprehensively improve and enlarge the old waterway existing from time immemorial between Lake Michigan, the Illinois and Mississippi River and the Gulf of Mexico, and also the efforts of the State and the City of Chicago, beginning practically at the time Chicago became a city, to protect the Lake Michigan water supply and dispose of the drainage and sewage of the city.

THE SANITARY DISTRICT ACT DESCRIBED.

(Appellant's Narrative, p. 69.)

While the Act was in terms general and applied to any territory that might come within its specifications, yet it was generally understood that there was no similar situation in Illinois, and the Act may be considered as a special act to meet the conditions then confronting Chicago and its environs.

Pursuant to Section 1 of the act, appellant was organized and given its name by a proper petition filed as provided, and by an election held on November 5, 1889. The trustees, being the corporate authorities of the municipality thus organized, were elected in December following, and the trustees took office and organized as a Board immediately.

Express powers were given under the act to (Section 7)

> "provide for the drainage of such district by laying out, establishing, constructing and maintaining, one or more main channels, drains, ditches and outlets for carrying off and disposing of the drainage, including the sewage of such district, together with such adjuncts and additions thereto as may be necessary or proper to cause such channels or outlets to accomplish the end for which they are designed, in a satisfactory manner; also to make and establish docks adjacent to any navigable channel made under the provisions hereof for drainage purposes, and to lease, manage and control such docks, and also to control and dispose of any water power which may be incidentally created in the construction and use of said channels, or outlets, but in no case shall said Board have any power to control water after it passes beyond its channels, waterways, races or structures into a river or natural waterway or channel or water power or dock situated on such river, natural waterway or channel:" (Appellant's Narrative, p. 28.)

To carry out these express powers, appellant was authorized to levy taxes, borrow money, purchase real estate, and let contracts.

NOTE: The Illinois Supreme Court held the act constitutional on June 12, 1890.

Section 12 prohibited appellant from building over or across its Sanitary & Ship Canal, immovable bridges. It was expressly provided that all bridges built should not interfere with or obstruct navigation, and should be so constructed that they could be raised, swung or moved out of the way of vessels, tugs or boats.

In order to permit and empower the District to improve the Chicago River and its various branches, enlarge the Illinois and Michigan Canal if found to be a suitable site for the Sanitary & Ship Canal, and to reverse the Calumet River, Section 17 provided:

> "When it shall be necessary in making any improvements which any district is authorized by this act to make, * * * such district shall have the power to * * * and may enter upon, use, widen, deepen and improve any navigable or other waters, waterways, canal or lake:" (Appellant's Narrative, p. 69.)

Section 20 expressly directed appellant to turn into the channel or channels constructed as outlets for the sewage and drainage within its limits,

> "not less than 20,000 cubic feet of water per minute for every 100,000 inhabitants of said district, and shall thereafter maintain the flow of such quantity of water." (Appellant's Narrative, p. 71.)

Section 21 authorized the Attorney General to compel compliance with the above mentioned provision of Section 20.

Section 23 specified the dimensions and capacity of the Sanitary and Ship Canal.

> "23. If any channel is constructed under the provisions hereof by means of which any of the waters of Lake Michigan shall be caused to pass into the DesPlaines or Illinois river such channel shall be constructed of sufficient size and capacity to produce and maintain at all times a continuous flow of not less than 300,000 cubic feet of water per minute, and to be of a depth of not less than fourteen feet, and a current not exceeding three miles per hour, and if any portion of any such channel shall be cut through a territory with a rocky stratum where such rocky stratum is above a grade sufficient to produce a depth of water from Lake Michigan, of not less than eighteen feet, such portion of said channel shall have double the flowing capacity above provided for, and

a width of not less than one hundred and sixty feet at the bottom capable of producing a depth of not less than eighteen feet of water. If the population of the district draining into such channel shall at any time exceed 1,500,000 such channel shall be made and kept of such size and in such condition that it will produce and maintain at all times a continuous flow of not less than 20,000 cubic feet of water per minute for each 100,000 of the population of such district, at a current of not more than three miles per hour, and if at any time the general government shall improve the DesPlaines or Illinois Rivers, so that the same shall be capable of receiving a flow of 600,000 cubic feet of water per minute, or more, from said channel, and shall provide for the payment of all damages which any extra flow above 300,000 cubic feet of water per minute from such channel may cause to private property so as to save harmless the said district from all liability therefrom, then such sanitary district shall within one year thereafter, enlarge the entire channel leading into said DesPlaines or Illinois rivers from said district to a sufficient size and capacity to produce and maintain a continuous flow throughout the same of not less than 600,000 cubic feet of water per minute with a current of not more than three miles per hour, and such channel shall be constructed upon such grade as to be capable of producing a depth of water not less than eighteen feet throughout said channel, and shall have a width of not less than one hundred and sixty feet at the bottom. In case a channel is constructed to the Desplaines river as contemplated in this section it shall be carried down the slope between Lockport and Joliet to the pool commonly known as the upper basin of sufficient width and depth to carry off the water the channel shall bring down from above. The district constructing a channel to carry water from Lake Michigan of any amount authorized by this act, may correct, modify and remove obstructions in the Desplaines and Illinois rivers wherever it shall be necessary so to do to prevent overflow or damage along said river, and shall remove the dams at Henry and Cooperas Creek in the Illinois river, before any water shall be turned into the said channel. * * *" (Appellant's Narrative, p. 72.)

Note: If appellant exercised the power to build outlets for the sewage and drainage within its territorial limits, it was compelled to construct it through a rocky stratum and through the Des Plaines River to Lockport and Joliet. Appellant waived the condition stated in the act that the General Government should improve the DesPlaines and Illinois Rivers, and built its main channel, or the Sanitary and Ship Canal, of a capacity throughout of not less than 600,000 cubic feet per minute, or 10,000 per second.

Section 24 provided that the Sanitary & Ship Canal should be a navigable water of the United States, under the control of the Government for navigation purposes, but not for sanitary or drainage purposes.

Section 26 gave the right to any municipality contiguous to the City of Chicago and within the territorial limits of appellant, to receive water obtained by Chicago from Lake Michigan for drinking and domestic purposes. (Appellant's Narrative, p. 75.)

Section 27 provided for the appointment of a commission by the Governor to inspect the Sanitary & Ship Canal and report as to whether the appellant had complied in the construction of it with the provision of the Sanitary District Act.

The appellant immediately entered upon the construction of the canal, by making the surveys provided for by the Drainage & Water Supply Commission report above mentioned, which formed the basis of the Sanitary District Act, and pursuant to the act itself. (Appellant's Narrative, p. 286.)

UNITED STATES ENGINEERS' ACTS CONCERNING THE SANITARY AND SHIP CANAL.

Captain Marshall, U. S. Engineer stationed at Chicago, immediately reported to the Chief of Engineers the action of the Drainage & Water Supply Commission and the passage of the Act of May 29, 1889, *verbatim* copies of the Commission's report and of the Act being transmitted therewith. The report of Capt. Marshall is contained in the Chief of Engineers Reports to Congress for the year 1890. (Appellant's Narrative, p. 451.)

April 21, 1891, the Board of Trustees of the appellant, by resolution provided that the appellant should forthwith

> "enter upon, use, widen, deepen and improve the Chicago River from its mouth at Lake Michigan to the South Branch thereof, and also the South Branch thereof, together with the South and West Forks thereof, so as to make the same a proper and sufficient supply channel for the Main Channel heretofore surveyed from the Chicago River to Joliet;"

The resolution also provided that a copy of same should be, and it was, sent to the Secretary of War of the United States. (Appellant's Narrative, p. 454.)

The Chief of Engineers Reports to Congress for the year 1892, contained a report by Capt. Marshall, U. S. Engineer at Chicago, of the progress of the work of the appellant. (Appellant's Narrative, p. 454.)

August 9, 1893, Capt. Marshall reported to the Chief of Engineers, U. S. Army, that actual excavation of the Sanitary & Ship Canal had been commenced. This report was contained in the Chief of Engineers Reports to Congress for the year 1893. (Appellant's Narrative, p. 455.) Among other things, Capt. Marshall stated:

> "Without criticising in any way the local measures taken for local relief, it may be said that the state laws, if effectively executed for the purposes specified, seemingly require changes in the capacity of Chicago River

and its branches that may increase, may diminish, or may even entirely destroy their value for commercial purposes. In any case under existing laws, no alteration in the capacity of Chicago River can be made without the consent of the Secretary of War, or without full examination by agencies established by Congress, and the execution of the state laws are therefore limited by superior authority."

Further, Capt. Marshall's report stated:

"It will soon be necessary for Congress to provide for the extension to Lake Michigan of the navigation established on the Illinois River below LaSalle, and to determine to what extent, if at all, it will utilize for navigation the great channel now being cut by local authorities in the rock divide, separating Lake Michigan from the Mississippi Valley. The question is at hand and must be determined at some date not far in the future, whether the national highway will utilize this cut and Chicago River as part of this communication, or the Calumet River route in connection with this local channel, or otherwise. There are no other practicable routes."

* * *

"Should a discharge of 250,000 cubic feet per minute be required through the south branch and main river, wholesale modification of bridges, tunnels and docks, and a widening of the river at many points will be required, and deepening to at least 18 feet of water below Chicago city datum with a slope necessary for this discharge, will be required * * *"

The Chief of Engineers' Reports for the year 1895, contained a further report of Capt. Marshall to the Chief of Engineers of that year, and the report stated:

"The City of Chicago expects to turn into the channel of the Illinois at some future time 5,000 cubic feet of Lake Michigan water per second; at some more remote period there may be 10,000 cubic feet per second, but not probably within a generation." (Appellant's Narrative, p. 463.)

The Secretary of War appointed a Board of Engineers, consisting of Gen. O. M. Poe, Brig. Gen. E. H. Ruffner and Maj. W. L. Marshall, to consider and report upon

"the probable effect of the operation of the Chicago Drainage Canal upon the lake and harbor levels and

upon the navigation of the Great Lakes and their connecting waterways." (Appellant's Narrative, p. 464.)

This Board of Engineers reported, on August 16, 1895, to the Chief of Engineers, and among other things stated (Appellant's Narrative, p. 465.)

> "The Board met in Chicago August 12, 1895, and on the 13th and 14th accompanied the officers of the Drainage Canal over the line under construction. Every facility and courtesy possible has been extended by the Trustees and Engineers of the Canal for a full investigation of the subject matter".

The report of this Board of Engineers described the works under construction, the purpose of withdrawing approximately 10,000 cubic seconds feet of water from Lake Michigan through the Sanitary & Ship Canal. It was estimated that this would lower the levels of Lakes Michigan and Huron approximately six inches, and the other Great Lakes, except Lake Superior, in varying amounts, including their connecting channels.

June 16, 1896, appellant requested the Secretary of War for a permit to improve the South Branch and the West Fork of the Chicago River, to increase its capacity for the initial operation of the Sanitary & Ship Canal at its opening. The population of the District was then estimated to be approximately a million and a half people, requiring a diversion of 5,000 cubic seconds feet of water, in accordance with the statutory ratio of dilution. Among other things, the request for the permit stated (Appellant's Narrative, p. 88):

> "The work of the Sanitary District has progressed so far that it is now necessary for us to enter upon that which must be done in the Chicago River to make available the artificial channel which we have under construction from Robey Street, Chicago, to Lockport in Will County, twenty-eight miles distant.
>
> Our connection with Lake Michigan must be through the Chicago River, with the West Fork and the South Branch of which we make a junction at Robey Street."

Attached to the request, was a plan showing the improvements to be made on a certain section of the river. On June 24, 1896, Maj. Marshall reported to the Chief of Engineers, recommending the granting of a permit as requested, and in so doing, among other things stated:

> "As far as the work itself is concerned, there can be no objection to it, as in every case the navigation channel of the Chicago River will be improved." (Rec. Vol. VI, p. 3473.)

On July 3, 1896, in every respect following the recommendations of Maj. Marshall and those of the Chief of Engineers, the Secretary of War issued a permit for the improvement, requiring as a condition, however, that each by-pass, new dock and new bridge, be authorized by special permit.

Condition 2 provided (Appellant's Narrative, p. 474):

> "That this authority shall not be interpreted as approval of the plans of the Sanitary District of Chicago to introduce a current into the Chicago River. This latter proposition must be hereafter submitted for consideration."

On October 28, 1897, a request for permit for the improvement of certain other sections of the South Branch and West Fork of the Chicago River, was sent to the Secretary of War, the purpose of which was stated in the request to be

> "to conform to the plans of this District for securing an adequate flow of water through said stream. Our general plans have been heretofore submitted to the War Department. * * *" (Appellant's Narrative, p. 475.)

On November 16, 1897, pursuant to the recommendations of Maj. Marshall, U. S. Engineer at Chicago, a permit was granted by the Secretary of War, subject to the same conditions as were contained in the July 3, 1896, permit. (Appellant's Narrative, p. 475.)

November 30, 1898, January 13, 1899, March 10, 1899, and May 12, 1899, permits were granted by the Secretary of War to appellant to do various work in connection with the river

improvement, such as construction of bridges, building by-passes, coffer dams, etc. (Appellant's Narrative, p. 477.)

On February 23, 1898, pursuant to the invitation of appellant, the Rivers & Harbors Committee of the House of Representatives inspected the Sanitary & Ship Canal which was then substantially completed. (Appellant's Narrative, p. 184.)

On May 8, 1899, the Secretary of War issued a permit for the opening of the Sanitary & Ship Canal. There were certain preambles to the permit stating the purposes of the appellant's works and the request of the appellant for a permit. The permit, not including said preambles, is as follows:

> "Now therefore, The Chief of Engineers having consented thereto, this is to certify that the Secretary of War hereby gives permission to the said Sanitary District of Chicago to open the channel constructed and cause the waters of Chicago river to flow into the same, subject to the following conditions:
>
> 1. That it be distinctly understood that it is the intention of the Secretary of War to submit the questions connected with the work of the Sanitary District of Chicago to Congress for consideration and final action, and that this permit shall be subject to such action as may be taken by Congress.
>
> 2. That if, at any time, it become apparent that the current created by such drainage works in the south and main branches of the Chicago river, be unreasonably obstructive to navigation or injurious to property, the Secretary of War reserves the right to close said discharge through said channel or to modify it to such extent as may be demanded by navigation and property interests along said Chicago river and its South Branch.
>
> 3. That the Sanitary District of Chicago must assume all responsibility for damages to property and navigation interests by reason of the introduction of a current in Chicago river." (Appellant's Narrative, p. 481.)

Prior to the issuance of the said permit, complete investigation of the subject matter was made by Maj. Marshall, U. S. Engineer at Chicago, the result of which is embodied

in his report to the Chief of Engineers dated April 24, 1899, portions of which are as follows:

> "* * * In my opinion the abstraction of from 300,000 to 600,000 cubic feet per minute will permanently lower Michigan, Huron and Erie from three to eight inches; not more than eight nor less than three, corresponding to an extreme reduction of from 160 to 466 tons in carrying capacity of the large vessels of the lakes, and that it will take from three to four years for this full effect to be obtained."
>
> "* * * Individually I have to say that I am in entire sympathy with the people in their effort to purify their water supply. I have lost my only son from typhoid fever, produced, I believe from drinking water polluted by defective drainage at Chicago, which this channel will correct. In every proper way I have aided the officers of the Drainage District. I would like further to aid them, but I believe this question to be entirely out of my sphere, and too great and important for me even to venture an opinion or make a recommendation about. Yet I may venture to suggest that the entire subject be referred to Congress for final solution, and that a conditional permit or authority be granted to the authorities of the Chicago Sanitary District by the War Department, awaiting action by Congress, to open their channel * * *." (Appellant's Narrative, p. 478.)

Prior to the issuance of the permit of May 8, 1899, General Alger, the Secretary of War, who issued the permit and Gen. John M. Wilson, the Chief of Engineeers, who recommended its issuance, personally inspected the appellant's works. (Appellant's Narrative, p. 338.)

The Commission appointed by the Governor of Illinois under Section 27 of the Sanitary District Act, certified that the Sanitary & Ship Canal had been completed in all respects in accordance with the provisions of Section 23 of said Act. Thereupon, on January 17, 1900, the Sanitary & Ship Canal was opened, placed in operation, and has been continuously operated. Improvements had been made as heretofore stated, in the Chicago River, the South Branch and the West Fork thereof, to provide for a flow from Lake Michigan through the channels of said rivers to the Sanitary & Ship Canal, of

approximately 300,000 cubic feet per second, without creating a current unduly obstructive to navigation in the Chicago River, the population of appellant being then approximately a million and a half of inhabitants.

The channels of the Chicago River, the South Branch and the West Fork thereof, were then, however, narrow, shallow and tortuous, being only 17 feet deep and at places only 90 feet in width, with many obstructive center pier bridges. To provide immediately for the increase in population, and to prevent these rivers from flowing into Lake Michigan, carrying pollution to the water supply, when the run-off of the Chicago River drainage area exceeded 300,000 cubic feet per minute, a plan for the comprehensive improvement of the Chicago River and its branches to the northern terminus of the Sanitary & Ship Canal was adopted by appellant. This plan provided for the deepening of the channels of these rivers at all points to 26 feet, and widening them to 200 feet, replacement and reconstruction of obstructive bridges with new bridges of the bascule type and the wideming of bridge openings.

Two requests for permits to carry out these plans were made to the Secretary of War, dated April 26th and June 7th, 1900, respectively. The two requests covered the entire stretch off the channels of the South Branch and the West Fork to the northern terminus of the Sanitary & Ship Canal. They stated the purpose of appellant in improving the said river channels, and described the width and depth of the river channels as they would be when the plan was carried out, and that

> "the work to be done is to be prosecuted progressively as to time, the rate of progress being limited by the rapidity with which the right of way may be acquired and the resources for the execution of the work to be made available." (Appellant's Narrative, p. 90.)

Thereupon, on July 11, 1900, the Secretary of War issued two permits, as requested by the application of April 26th

and June 7th, 1900, respectively, above mentioned. The two permits, after referring to the application, each stated:

> "I beg to inform you that there is no objection on the part of the War Department to the prosecution of work of improvement of Chicago River, specified in the above mentioned letter, and delineated on the maps which accompany the same, it being understood that this statement as to the attitude of the War Department shall not be understood as involving the General Government in any way with the expense incident to the carrying out of the project, and does not in any way invalidate, waive or affect the right of the Secretary of War to regulate or revoke the permit granted under date of May 8, 1899, to the Sanitary District of Chicago to divert the waters of the Chicago River and cause them to flow into the artificial channel, such permission being subject to the following conditions, viz." (Appellant's Narrative, p. 91.)

The conditions were precisely the same as contained in the May 8, 1899, permit for the opening of the channel. (this Brief p. 38.)

Orders of Secretary of War claimed by appellee to modify the May 8, 1899 permit.

The first modification of the permit of May 8, 1899, was made by the Secretary of War on the 9th of April, 1901, solely because of the current in the Chicago River. This modification was contained in a document signed by the Secretary of War which, after reciting the issuance of the permit of May 8, 1899, to open the Sanitary & Ship Canal, and Condition 2 thereof—namely that the Secretary of War might modify and restrict the flow if it should prove unreasonably obstructive to navigation on the Chicago River, provided:

> "And whereas it is alleged by various commercial and navigation interests that the present discharge from the river into the drainage canal sometimes exceeds 300,000 cubic feet per minute, causing a velocity of nearly 3 miles per hour, which greatly endangers navigation in the present condition of the river.

> "Now, therefore, this is to certify, that the Secretary of War, upon the recommendation of the Chief of Engineers, hereby directs said Sanitary District to regulate the discharge from the river into the drainage channel, so that the maximum flow through the Chicago river and its South Branch, shall not exceed 200,000 cubic feet per minute." (Appellant's Narrative, p. 23.)

On July 23, 1901, on the application of the Sanitary District, the Secretary of War amended the direction of April 9, 1901, providing that the flow through the river to the Sanitary & Ship Canal might be increased to 300,000 cubic feet per minute between the hours of 4:00 P. M. and 12:00 o'clock midnight. (Appellant's Narrative, p. 24.)

On December 5, 1901, the Secretary of War directed the appellant to limit the flow through the Chicago River, the South Branch and West Fork thereof, to 250,000 cubic feet per minute throughout the 24 hours of the day. The document so directing appellant, recited the issuance of the permit of May 8, 1899, for the opening of the Sanitary & Ship Canal, and Condition 2 thereof with reference to navigation on the Chicago River and the various directions of the Secretary of War thereafter made. (Appellant's Narrative, p. 24.)

On January 17, 1903, the Secretary of War, after reciting the issuance of the original permit of May 8, 1899, and the directions made thereunder, consented to appellant's increasing the flow until the 31st day of March, 1903, to 350,000 cubic feet per minute, and directed that thereafter it should be reduced to 250,000 cubic feet per minute throughout the 24 hours of the day, as prescribed by the direction of December 5, 1901. It is therefore upon this direction or so-called permit of December 5, 1901, that this litigation is based, as the Secretary of War did not thereafter issue any other permits or give any further directions with reference to the flow through the Chicago River, the South Branch and the West Fork thereof, to the northern terminus of the Sanitary & Ship Canal. (Appellant's Narrative, p. 25.)

Chicago River improvement under appellant's project of 1900, made pursuant to the permits of the Secretary of War of July 11, 1900.

Almost immediately upon the opening of the Main Channel, January, 1900, and after the permits of the Secretary of War above mentioned were issued, the appellant commenced the improvement of the South Branch and West Fork thereof, by acquiring many pieces of right of way for the river widening, (792,000 square feet). The channels were deepened from 17 feet to 26 feet throughout, and widened at all points to 200 feet, an average of 50 feet being taken off of the river channels at various points. The most at any one place was 110 feet. It involved the excavation of 5,500,000 cubic yards of material, and the construction of over 19,000 lineal feet of dock. This improvement also required the replacement of old center pier bridges with modern bascules. The bridges being built were State Street, Dearborn Street, Randolph Street, Jackson Boulevard, Harrison Street, Taylor Street, Chicago Terminal Transfer Railroad Bridge, 18th Street, 22nd Street, Main Street, Throop Street, Ashland Avenue, Washington Street. (Appellant's Narrative, p. 182.)

This work was practically completed prior to February 5, 1912, when the Sanitary District asked that the limitation of 4,167 seconds feet be removed, and that it be specifically authorized to divert 10,000 cubic seconds feet by means of its various diversion sources. (Appellant's Narrative, p. 395.)

Appellant also deepened the North Branch of the Chicago River, making it 12 feet deep, 90 feet wide and navigable. The South Fork of the South Branch was also deepened to 20 feet. (Appellant's Narrative, p. 183.)

The Chicago River proper was deepened by the United States to 20 feet at all points.

The Chicago River improvement described enabled appellant to draw through the Chicago River, the South Branch and the West Fork, and divert to and through the Sanitary & Ship Canal, 10,000 cubic seconds feet of water, so that

the current in the river channels would not be over one and one-quarter miles per hour and therefore not injurious to navigation on said river. A mile and a quarter an hour was the velocity the Secretary indicated to be acceptable. (Appellant's Narrative, p. 182.)

Acts amendatory and supplementary to the original Sanitary District Act of May 29, 1889.

In connection with the Chicago River improvement, the General Assembly passed an act approved May 13, 1901, in force July 1, 1901, expressly authorizing appellant to construct bridges over any river made necessary

> "by reason of widening, deepening or improving of such river." (Appellant's Narrative, p. 30.)

May 14, 1903, the General Assembly of Illinois passed an act, in force July 1, 1903, authorizing the annexation to the appellant's corporate limits of certain territory south of 87th Street of the City of Chicago, known as the Calumet Region, and certain territory north of the City of Chicago, to embrace what is called the North Shore Suburbs. The act authorized appellant to construct and maintain channels, drains, ditches and outlets for this additional territory, substantially the same as authorized for the original Sanitary & Ship Canal under the Act of May 29, 1889: To cut through the Illinois & Michigan Canal and thus destroy it between Joliet and Chicago, on condition, however, that it build a proper lock at its southern terminus to connect with the Des Plaines River, and a channel not less than 10 feet deep and 100 feet wide to connect with the upper basin of the Illinois & Michigan Canal at Joliet, thus making proper connection with the Illinois & Michigan Canal at Joliet, permitting boats to pass from Joliet over the Sanitary & Ship Canal to Chicago and Lake Michigan. Another condition was that there should be reserved and provided by the appellant at its southern terminus, a site for a lock 800 feet in length and 130 feet

in width, to be used in case of enlargement of the waterway.

Section 3 of this act provided:

> "Said Sanitary District shall permit all water-craft navigating or purposing to navigate said Illinois & Michigan Canal, to navigate all of said channels of said Sanitary District promptly, without delay, and without payment of any tolls or lockage charges for so navigating in said channel."

Sections 5 and 6 of this act expressly authorized the District to make available the water power at the southern terminus of its main channel to be used in the operation of its own pumping plants and machinery, and to be sold for public purposes to cities, villages and towns within the limits of the District.

Section 8 of the act provided:

> "The said Sanitary District shall, at the expense of said District, in all respects comply with the provisions of the acts of Congress of March 30, 1822, and March 2, 1827, as construed by the courts of last resort of the State of Illinois and of the United States in relation to the Illinois & Michigan Canal so far as it affects that portion of the Illinois & Michigan Canal vacated or abandoned by the terms of this act." (Appellant's Narrative, p. 32.)

Pursuant to the Act of May 14, 1903, the Calumet Sag Channel was constructed and completed in the year 1922, extending from the Little Calumet River to the Sanitary & Ship Canal at Sag, Illinois, and likewise the North Shore Channel was constructed and completed in the year 1910, extending from the North Branch of the Chicago River to the Lake Shore at Wilmette, Illinois. (Appellant's Narrative, p. 137.)

JANUARY 8, 1913, SECRETARY OF WAR STIMSON REFUSED TO REMOVE THE ALLEGED LIMITATION ON THE WITHDRAWAL OF WATER THROUGH THE CHICAGO RIVER, SOUTH BRANCH AND WEST FORK, AND TO FIX IT AT 10,000 SECONDS FEET, AS REQUESTED BY APPELLANT.

The Chicago River Improvement Project of 1900 having been substantially completed, so that a current would not exist injurious to navigation on the Chicago River and its branches, on February 5, 1912, the appellant asked the Secretary of War to remove the alleged limitation of December 5, 1901, made, at that time, because of the current in the Chicago River, the South Branch and the West Fork thereof. This amount, 10,000 cubic seconds feet, was necessary in order to keep the said rivers at all times reversed and flowing away from Lake Michigan, (Appellant's Narrative, p. 12) thus protecting the water supply. The Secretary of War, however, refused by memorandum dated January 8, 1913. (Appellant's Narrative p. 12.) The memorandum of Secretary of War Stimson concluded as follows:

> "1. That the diversion of 10,000 cubic feet per second from Lake Michigan as applied for in this petition, would substantially interfere with the navigable capacity of the navigable waters in the Great Lakes and their connecting rivers.
>
> "2. That being so, it would not be appropriate for me, without express Congressional sanction, to permit such a diversion, however clearly demanded by the local interests of the sanitation of Chicago.
>
> "3. That on the facts here presented, no such case of local permanent necessity is made evident.
>
> "4. That the provisions of the Canadian Treaty for a settlement by a Joint Commission of 'questions or matters of difference' between the United States and Canada, offer a further reason why no administrative offi-

cer should authorize a further diversion of water manifestly so injurious to Canada, against Canadian protest." (Appellant's Narrative, p. 16.)

Thereupon the principal branch of this litigation was instituted by the complaint filed October 6, 1913, heretofore described.

NOTE: Appellant contends that the memorandum of the Secretary of War is immaterial. His only power was to grant or refuse the permit.

ACTS OF CONGRESS AND REPORTS AND RECOMMENDATIONS OF BOARDS OF ENGINEERS AND COMMISSIONS, PURSUANT TO SUCH ACTS, PASSED AND MADE SUBSEQUENT TO THE PASSAGE OF THE SANITARY DISTRICT ACT OF MAY 29, 1889, RELATING TO THE PRESERVATION AND COMPLETE UTILIZATION TO THE FULL AMOUNT OF APPELLANT'S DIVERSION.

Under the Rivers and Harbors Act of June 3, 1896, (Laws Improvement of Rivers & Harbors, Vol. 1, p. 793, U. S. Stat. at large Vol. 29, p. 202), the following item appeared for survey and examination:

> "The Upper Illinois River and Lower DesPlaines River, with a view to extension of navigation from Illinois River to Lake Michigan at or near Chicago."

Pursuant to this act, Gen. W. L. Marshall made a report, dated January 27, 1897, which was transmitted to Congress March 3, 1897, as H. R. Document No. 33, 54th Congress, 2d Session. Among other things, this report stated:

> "The Sanitary District of Chicago has nearly completed a canal for drainage purposes from Chicago River at Robey street to near Lockport from 18 to 22 feet in depth below the proposed water surface, and varying in width from 160 feet in rock to more than 200 feet in earth, a length of 28 miles, which may be made available as part of any enlarged waterway over the route in question, and is of much greater dimensions than required by any commercial canal adapted for the conditions and requirements of present or prospective traffic by water between Lake Michigan and the region along the water courses of the Mississippi Valley. To comply with the law of the State of Illinois under which this drainage canal is constructed—*it has been constructed of a capacity to discharge* 600,000 *cubic feet per minute through the section excavated in rock and* 300,000 *cubic feet per minute*

Note: In referring to the Rivers and Harbors Acts of Congress for convenience we use "Laws of the United States relating to the Improvement of Rivers and Harbors, from August 11, 1790, to March 4, 1913," H. R. Document No. 1491, 62nd Congress, 3rd Session, copies of which for each member of the court are provided.

throughout the earth section—the law requires a discharge of 20,000 *cubic feet per minute for each* 100,000 *inhabitants of the drainage district which at present requires more than* 300,000 *cubic feet and in a few years will require the full* 600,000 *cubic feet discharge through the canal. The taking of water from Lake Michigan, however, for drainage purposes (or rather for dilution of sewage) has not yet been authorized by Congress."* (Appellant's Narrative, p. 487.)

This report is referred to in the following item of the Rivers & Harbors Act of March 3, 1899, which contained Sections 9 and 10 under which the Secretary of War seeks to regulate the Chicago diversion (This Brief, p. ....)

"Illinois River and DesPlaines River, Illinois: The Secretary of War is directed to appoint a board of three engineers, which board shall make a survey and estimates of cost for the improvement of the Upper Illinois River and Lower DesPlaines River, in Illinois, with a view to the extension of navigation from the Illinois River to Lake Michigan at or near Chicago; said board of engineers shall report the estimates of cost for a channel seven feet deep, and also for a channel eight feet deep, throughout said proposed route; said survey and estimates of cost shall be made in pursuance of and according to the recommendations in report of January twenty-seventh, eighteen hundred and ninety-seven."

Act of Congress of June 6, 1900, further carrying out the purpose of said Act of March 3, 1899, provided (Laws Improvement of Rivers and Harbors, Vol. 2, 914; U. S. Stat. at large, Vol. 31, p. 578.)

"That the board of three engineers, appointed by the Secretary of War, in pursuance of a paragraph in the river and harbor act approved March third, eighteen hundred and ninety-nine, to make a survey and estimates of cost of the improvement of the Upper Illinois River and the lower DesPlaines River in Illinois, with a view to the extension of navigation from the Illinois River to Lake Michigan at or near the City of Chicago, is hereby authorized to report the estimates of cost for a channel ten feet deep, and for a channel twelve feet deep, and for a channel fourteen feet deep through said proposed route, and that the said estimates cover and include a proper *connection at Lockport with the sanitary and*

ship canal which has been constructed by the sanitary district of Chicago. The said board of engineers is also further authorized to make a survey and estimates of cost for the improvement of the Lower Illinois River from the end of said proposed route to the mouth of said river, for channels ten, twelve and fourteen feet deep, respectively, and to report the estimates of cost thereof:"

Act of Congress of June 13, 1902, provided (Laws Improvement of Rivers and Harbors, Vol. 2, 995; U. S. Stat. at large, Vol. 32, p. 573):

"The sum of two hundred thousand dollars, or so much thereof as may be necessary, is hereby appropriated for making such surveys, examinations, and investigations as may be required to determine the feasibility of, and to prepare and report plans and estimates of cost of, a navigable waterway fourteen feet in depth from *Lockport,* Illinois, by way of the DesPlaines and Illinois rivers, to the mouth of said Illinois River, and from the mouth of the Illinois River, by way of the Mississippi River, to Saint Louis, Missouri."

Section 4 of the same act provided for the establishment of the International Waterways Commission, to make among other things a study and report to Congress upon the regulation of diversions of water. The members of the International Waterways Commission appointed under said Act, were to act in conjunction and cooperation with members of said Commission to be appointed by the Government of Canada. Said section is in part as follows (Laws Improvement of Rivers and Harbors, Vol. 2, 1007):

"That the President of the United States is hereby requested to invite the Government of Great Britain to join in the formation of an international commission, to be composed of three members from the United States and three who shall represent the interests of the Dominion of Canada, whose duty it shall be to *investigate and report upon the conditions and uses of the waters adjacent to the boundary lines between the United States and Canada, including all of the waters of the lakes and rivers* whose natural outlet is by the River Saint Lawrence to the Atlantic Ocean; *also upon the maintenance and regulation of suitable levels; and also upon the ef-*

fect upon the shores of these waters and the structures thereon, and upon the interests of navigation, by reason of the diversion of these waters from or change in their natural flow; and further, to report *upon the necessary measures to regulate such diversion,* and to make such recommendations for improvements and *regulations as shall best subserve the interests of navigation in said waters.* The said Commissioners shall report upon the advisability of locating a dam at the outlet of Lake Erie, with a view to determining whether such dam will benefit navigation, and if such structure is deemed advisable, shall make recommendations to their respective Governments looking to an agreement or treaty which shall provide for the construction of the same, and they shall make an estimate of the probable cost thereof."

Resolution of April 21, 1904, specifically with reference to the crests of the dams at Kampsville and La Grange is as follows (Laws of United States relating to Improvement of Rivers and Harbors, Vol. 2, 1049; U. S. Stat. at large, Vol. 33, p. 589):

"*Resolved by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of War is hereby authorized, in his discretion, with the concurrence of the Chief of Engineers, to permit the Sanitary District of Chicago, at the expense of said corporation, to lower the height of the Government dams in the Illinois River at Kampsville and LaGrange, Illinois, in accordance with such plans as he may prescribe and subject to such stipulation and conditions as, in his judgment, may be necessary to protect the interests of the United States."

The appellant, by permit and authorization of the Secretary of War, partially removed the crests of said dams. (Appellant's Narrative, p. 399.)

Section 1 of an Act of Congress of June 29, 1906, provided (Laws Improvement of Rivers and Harbors, Vol. 2, 1192; U. S. Stat. at large, Vol. 34, p. 626):

"That the diversion of water from Niagara River or its tributaries, in the State of New York, is hereby prohibited, except with the consent of the Secretary of War as hereinafter authorized in section two of this Act: *Provided, that this prohibition shall not be interpreted as*

forbidding the diversion of the waters of the Great Lakes or of Niagara River for sanitary or domestic purposes, or for navigation, the amount of which may be fixed from time to time by the Congress of the United States or by the Secretary of War of the United States under its direction."

Section 2 of this Act for the Preservation of Niagara Falls, authorized the Secretary of War to grant permits for the diversion of the Niagara River in New York for power purposes, with certain limitations as to gross amount, the principal object being to enable the operation of existing power plants.

Section 3 provided a penalty upon persons diverting water contrary to the provisions of the act.

Section 4 requested the President of the United States to open negotiations with the Government of Great Britain, looking towards the making of a treaty for regulation and control of the waters of the Naigara River and its tributaries.

Section 5 provided that the act should remain in force for three years.

Section 6 appropriated $50,000 to carry out the provisions of the act.

Section 7 reserved the right to alter, amend or repeal the act.

The history of the passage of this act is important. April 11, 1906, the bill was introduced in the House and referred to the Committee on Rivers and Harbors. It was reported back with amendments and passed the House. In the Senate it was ultimately referred to the Committee on Foreign Relations, of which Senator Lodge was Chairman. Among other amendments made in the Senate, was the one offered by Senator Albert J. Hopkins of Illinois, (numbered 6),

"provided, however, that nothing contained herein shall be construed to hold or concede that the waters of Lake Michigan or other lakes or rivers wholly within the territory of the United States, are the subject of international negotiation".

The House nonconcurred in the Senate amendments, and asked for a conference. The conference was thereupon held, and the report of the conferees recommended that the Senate recede from the amendment offered by Senator Hopkins, on the ground that this amendment would embarrass the President in the negotiations with Great Britain suggested by Section 4 of the bill relating to the making of a treaty to fix the diversion of the Niagara River and its tributaries. (Congressional Record, Vol. 40, p. 9097.)

Senator Hopkins opposed the adoption of the conference report, for the reason that his amendment was rejected. In answer to Senator Hopkins, Senator Lodge, the chairman of the committee, and one of the conferees, stated:

> "*Mr. Lodge.* Mr. President, I had supposed that the Senator from Illinois (Mr. Hopkins) realizes that the report of this bill in its present condition would not in any way endanger the rights of Chicago to have water from the lake. Certainly I should have adhered to the amendment if I had thought that the drainage canal of Chicago would have been in any way endangered by the Commission. The House would not accept this amendment. It is attached to a clause which requests the President to enter upon negotiations. It, of course, is merely advisory. Congress cannot possibly restrict the powers of the Executive in making a treaty. The result of putting on this clause beforehand would have been to have made any negotiations impossible. No country would enter into negotiations with a limitation on the other side like that.
>
> The first section of the bill protects the rights of Chicago. No treaty would be made by our Commissioners which would impair or infringe those rights.
>
> Moreover, Mr. President, the fact that it must be a matter of treaty, while it is a protection also, I think, warrants me in saying that what Canada desires is not to limit in any way the outflow of water at Chicago, but to be able to have a corresponding amount credited to her when they come to an agreement as to how much water each country may divert from the stream.
>
> I think, Mr. President, it would be a very great misfortune if the report should be rejected. Every right is safeguarded. The conferees were as anxious as the Senator from Illinois could possibly be to protect the

drainage canal at Chicago, but they did not feel warranted in allowing the whole legislation for such an important object to fall."

The Rivers and Harbors Act of March 2, 1907, provided for the appointment of a board to make a survey and examination of a channel 14 feet deep from St. Louis to the mouth of the Mississippi River;

"and the said Board may consider in connection with the examination herein provided for, the survey of a proposed waterway from Chicago to St. Louis, heretofore reported. * * * What increase of depth will be obtained over the natural flow of water in such regulated channel by an added volume of ten thousand cubic feet per second; also fourteen thousand cubic feet per second." (Laws Improvement of Rivers & Harbors, Vol. 2, p. 1261; U. S. Stat. at large, Vol. 34, p. 1073.)

The Rivers and Harbors Act of June 25, 1910, appropriated a million dollars for the construction of a waterway from Lockport, the southern terminus of the Sanitary & Ship Canal, by way of the DesPlaines and Illinois River, to the mouth of the Illinois, and also provided that the Secretary of War should appoint a Board of five members, four of whom should be engineer officers of the army, and one an engineer from civil life. The duties of the Board were stated in the act as follows:

"Said Board shall report upon the feasibility of such waterway and the most advisable depth and dimensions therefor in case the same is recommended; also upon such measures as may be required to properly preserve the levels of the Great Lakes and to compensate, so far as practicable, for the diminished level in said lakes and the connecting waters thereof by reason of any diversion of water from Lake Michigan for the maintenance of the proposed waterway herein described, or diversion for any other purpose. And further, also, upon the influence on volume and height of water in the Mississippi River below Cairo". (Laws, Improvement of Rivers & Harbors, Vol. 2, p. 1420; U. S. Stat. at large, Vol. 36, p. 630.)

On June 30, 1917, a joint resolution was adopted by Congress, as follows:

> *"Resolved by the Senate and House of Representatives of the United States of America in Congress assembled,* That public resolution numbered forty-five of the Sixty-fourth Congress, approved January 19, 1917, entitled 'Joint Resolution authorizing the Secretary of War to issue permits for additional diversion of water from the Niagara River,' is continued in full force and effect, and under the same conditions, restrictions and limitations, until July 1, 1918; *Provided,* That the Secretary of War is hereby authorized and directed to make a comprehensive and thorough investigation, including all necessary surveys and maps, *of the entire subject of water diversion from the Great Lakes and the Niagara River, including navigation, sanitary and power purposes,* and the preservation of the scenic beauty of Niagara Falls and the rapids of Niagara River, and to report to Congress thereon at the earliest practicable date. To carry out the provisions of this proviso there is hereby appropriated, out of any money in the Treasury not otherwise appropriated, the sum of $25,000." (U. S. Stat. at large, Vol. 40, p. 241.)

The reports of Boards of Engineers and Engineer Officers made pursuant to said Acts of Congress requiring same, assumed a diversion of 10,000 seconds feet at Chicago through appellant's works to be an existing fact, and recommended the location of a deep waterway along the Sanitary & Ship Canal, and the utilization of the said diversion through said Canal in connection with the improvement of the waterway below its southern terminus along the DesPlaines and Illinois Rivers to St. Louis.

The reports of the engineers as to the diversions of water from the Great Lakes, including the Board of Engineers for Rivers & Harbors, recommended the construction of compensating or regulating works in the St. Clair and Niagara Rivers to off-set for the diversions through the Sanitary & Ship Canal and at other places. No curtailment of diversions either for power and navigation purposes at Niagara Falls or through the Welland Canal or through appellant's canal for navigation and sanitary purposes, affecting lake surfaces, was recommended. Extracts from these reports will be found in Appellant's Narrative (p. 163).

REPORTS OF INTERNATIONAL WATERWAYS COMMISSION AND TREATY MADE PURSUANT TO RECOMMENDATIONS OF SAID COMMISSION, BETWEEN GREAT BRITAIN AND THE UNITED STATES SIGNED JANUARY 11, 1909, PROCLAIMED MAY 13, 1910, RELATING TO CANADIAN BOUNDARY WATERS.

The International Waterways Commission consisted of three members representing the United States, and three representing Canada. The Commission's duties and organization sprang from Section 4 of the Rivers and Harbors Act of June 13, 1902, above mentioned, and reciprocal legislation of the Canadian Government. Its duties generally involved the investigation of and reporting on all matters relating to the conditions and uses of boundary waters and waters adjacent thereto, and making recommendations as to a proposed treaty concerning such waters.

The International Waterways Commission made investigation of and reports upon the diversion of waters at Niagara Falls for water power purposes, and the division of such diversions between the United States and Canada. On May 3, 1906, report was made, signed by all the members of the Commission, the American as well as the Canadian members, recommending approximately 36,000 seconds feet diversion on the Candian side at Niagara Falls, and approximately 18,500 cubic seconds feet on the American side for power purposes. In reaching the amounts named and the division between the United States and Canada, the United States was charged with 10,000 cubic seconds feet diversion at Chicago by appellant, in addition to the 18,500 seconds feet at Niagara Falls. (Appellant's Narrative, p. 104.)

On January 4, 1907, the International Waterways Commission made a special report relating to appellant's diversion, entitled, "Report upon the Chicago Drainage Canal". This report reviewed the entire history of the construction

and operation of appellant's works, the proposed diversion of 4,000 cubic seconds feet through the Calumet Sag Channel and the Calumet River, in addition to that through the Sanitary & Ship Canal and the Chicago River. The Commission treated as an existing fact the diversion of 10,000 seconds feet, and considered that the only controversy which existed with reference to the amount of diversion by appellant, was that contemplated through the Calumet Sag Channel, namely the 4,000 cubic seconds feet maximum capacity. In referring to this matter, the report stated (Appellant's Narrative, p. 495):

> "Nor does it wish to re-open the case of the Chicago Drainage Canal as designed and built. It accepts that as a fixed fact with its attendant diversion of 10,000 cubic feet per second through the Chicago River. The extension of the system to the Calumet River alone is in question. * * * "

The Commission concluded:

> "The diversion of large bodies of water from Lake Michigan for supplying the drainage canal has not been authorized by Congress, but there appears to be a tacit general agreement that no objection will be made to the diversion of 10,000 cubic feet per second, as originally planned.
>
> * * *
>
> "The diversion of 10,000 cubic feet of water per second at Chicago will render practicable a waterway to the Mississippi River 14 feet deep. Any greater depth must be obtained by the abstraction of more water from Lake Michigan and at the expense of the navigation interests of the Great Lakes and of the St. Lawrence Valley."
>
> * * *

The Commission recommended:

> "* * * A careful consideration of all the circumstances leads us to the conclusion that the diversion of 10,000 cubic feet per second through the Chicago River will, with proper treatment of the sewage from areas now sparsely occupied, provide for all the population which will ever be tributary to that river, and that the amount named will therefore suffice for the sanitary purposes of

the city for all time. Incidentally it will provide for the largest navigable waterway from Lake Michigan to the Mississippi River which has been considered by Congress.

We therefore recommend that the Government of the United States prohibit the diversion of more than 10,000 cubic feet per second for the Chicago Drainage Canal."

* * *

Thereupon, a treaty was made and entered into between the United States and Great Britain, covering and following the subject matter of the recommendations of the International Waterways Commission. It was signed January 11, 1909, proclaimed May 13, 1910. (Appellant's Narrative, p. 529.)

The Treaty provided in the preliminary article that it was the intention

"to settle all questions which are now pending"

relating to the subject matter. Boundary waters were defined to be those

"from main shore to main shore of the lakes and rivers and the connecting waterways or the portions thereof, along which the international boundary * * * passes * * * but not including tributary waters which in their natural channels would flow into such lakes, rivers and waterways * * *"

Article 2 reserved to each of the parties

"or to the several State governments on the one side and the Dominion or Provincial Governments on the other, * * * the exclusive jurisdiction and control over the use and diversion * * * of all waters on its own side of the line which in their natural channels would flow across the boundary or into boundary waters."

Article 5 provided for diversion of 20,000 cubic feet of water per second at Niagara Falls on the American side for power purposes, and 36,000 cubic feet per second on the Canadian side.

Article 8 fixed the order of precedence of the uses of boundary waters to be.

"1. Uses for domestic and sanitary purposes.

2. Uses for navigation, including service of canals for the purposes of navigation.

3. Uses for power and for irrigation purposes." (Appellant's Narrative, p. 206.)

RESULTS AND EFFECT FROM HEALTH AND SANITARY STANDPOINT OF APPELLANT'S DIVERSION WORKS WITH THE ATTENDANT ABSTRACTION OF 10,000 CUBIC SECONDS FEET OF WATER FROM LAKE MICHIGAN.

The method of diverting sufficient water from Lake Michigan through the Chicago River, its branches, and the Sanitary & Ship Canal, to keep the Chicago River and its branches reversed (10,000 cubic seconds feet) was at the time the works were laid out and constructed, and is now, the only available method for the protection of the water supply.

The maximum run-off of the Chicago River drainage area is 10,000 cubic feet per second. In order to keep the Chicago River from flowing into Lake Michigan, carrying with it pollution to the water supply, it is necessary to divert from Lake Michigan an amount of water equal to this maximum run-off: (Appellant's Narrative: Fuller, p. 237; Phillips, p. 258; Stearns, p. 222; Wisner, p. 190; Cooley, p. 279.)

If the flow through the Sanitary & Ship Canal were reduced to 4,167 seconds feet, many times during each year in times of heavy rains, the Chicago River would flow into Lake Michigan. On account of the vast paved and sewered area, the water is delivered quickly to the Chicago River and its branches in from two to three hours. (Appellant's Narrative: Wisner, p. 390.) Tests were made on the drainage channel to ascertain how long it would take to change the flow from 4,167 second feet to 10,000 second feet. These tests showed that it would require approximately twenty-four hours to make such change, so that it would be impossible to so operate the Sanitary & Ship Canal and its controlling works at its southern terminus to anticipate the effect of heavy rains upon the water supply with the diversion reduced to 4,167 seconds feet, or any amount materially less than 10,000 seconds feet. (Appellant's Narrative: Wisner, p. 390.)

The cardinal principle, underlying proper protection of the water supply, is so arranging the works for the disposal of sewage and drainage that no sewage or drainage or effluent from artificial purification works may enter or come in contact with the water supply. (Appellant's Narrative: Cooley, p. 309; Wisner, p. 190; Phillips, p. 258; Stearns, p. 222.)

The Chicago River and its branches, before the Sanitary & Ship Canal was placed in operation, were filthy, dirty, sewage polluted waters, in septic condition, with gas bubbles rising, having large cakes of floating sewage mud. (Appellant's Narrative: Wisner, p. 189; Cooley, p. 291.)

The operation of the Sanitary & Ship Canal has absolutely remedied this condition so at the present time there is no local nuisance in the Chicago River, and the sewage does not get into the lake, polluting the water supply. (Appellant's Narrative: Wisner, p. 190; Cooley, p. 288.)

Prior to the opening of the Sanitary & Ship Canal, there were great epidemics of typhoid fever due to the polluted water supply, the death rate in such epidemics being as high as 170 per 100,000 people. (Appellant's Narrative: Cooley, p. 291.) For the 13 years prior to the opening of the Sanitary & Ship Canal, the annual death rate from typhoid fever was 52.6 per 100,000 population. For the 13 years after the opening of the canal, the annual death rate from typhoid fever was 19.9 per 100,000, a reduction of 68%. The reduction was greater in the latter period of 13 years than in any other American city, even where filtration plants had been installed. The rate for 1911 and 1912 was lower than the cities of Philadelphia, Washington, Pittsburg and New Orleans, where filtered water is supplied. The rate for those years is as low as in Boston, lower than San Francisco, where the water is obtained from carefully watched water sheds to prevent pollution. In the 13 years following the opening of the Sanitary & Ship Canal, diarrheal diseases were reduced 55%. (Appellant's Narrative: Wisner, p. 206.)

At page 323 of Appellant's Narrative, there is a chart showing death rate from typhoid fever in Chicago. There were no marked epidemics of typhoid fever at Chicago after the Sanitary & Ship Canal was opened. (Appellant's Narrative, p. 323.) The death rate from typhoid fever is a test of the health conditions of a city. Where one death from typhoid fever has been avoided by the use of pure water, a certain number of deaths, probably 2 or 3, from other causes have been avoided. This is known as Hazen's Law. (Appellant's Narrative: Adams, p. 326.) These facts are undisputed and no evidence was offered by appellee to the contrary.

HYDRAULIC EVIDENCE CONCERNING THE GREAT LAKES AND CLAIMED DAMAGE TO COMMERCE.

To what extent, if any, has or will the diversion of water from Lake Michigan at Chicago lower the levels of the Great Lakes and their outlets?

The Great Lakes occupy six depressions in the earth surface, and receive the drainage or run-off from a large area of adjacent land partly in Canada and partly in the United States, which run-off reaches them in major part by flowing over the surface in rivers and creeks. (Appellant's Narrative, p. 139.)

The precipitation varies in amount from month to month and year to year. On the Huron-Michigan drainage area, it varied from 38.63 inches in 1883 to 27.17 inches in 1895, a variation of about 42% from the minimum. (Appellant's Narrative, p. 139.) Evaporation takes place from the lake surfaces and from the ground and plant life. These two agencies, precipitation and evaporation, are the principal ones affecting the annual and monthly elevation of the Great Lakes, and are responsible for the major part of their fluctuations. (Appellant's Narrative, p. 139.)

The levels of the Great Lakes were actually higher during the ten years immediately following than during the ten years immediately preceding the opening of the Sanitary & Ship Canal. (Appellant's Narrative, p. 139.)

The diversion from the Great Lakes at Chicago through the Sanitary & Ship Canal, varied progressively from 4,300 cubic feet per second in 1900, to approximately 7,600 cubic feet per second in 1910. (Appellant's Narrative, p. 139.)

The waters involved are those of the entire lake system except Lake Superior and its tributaries, and except so much of the St. Mary's River as is above the foot of the Rapids at St. Ste. Marie.

The evidence of appellee as to the effect of the Chicago diversion upon the levels of the Great Lakes and their connecting waters, consisted entirely of the testimony of expert witnesses. (Appellant's Narrative, p. 127.) It related to the establishment of the increment of the St. Clair, Niagara and St. Lawrence Rivers. The increment of a river is the increase or decrease in its flow due to the rise or fall of one foot of the river's controlling lake.

Beginning with the year 1898, the United States Lake Survey had attempted to measure on numerous occasions the outflow of the discharge of the various outlet rivers. At the time when the determinations were made, hourly records had been kept of the stage of the different controlling lakes by automatic recording gauges. From these determinations, the discharge of the river at the time the velocity was obtained, could be calculated. The stage of the controlling lake at the time the discharge measurement was made, was then taken from the records of the recording gauge. The discharge measurements were plotted upon a paper according to the amount of the discharge and elevation of the lake at the time the discharge measurement was made. (Appellant's Narrative, p. 125.) As shown on Complainant's Exhibits 1 to 4, inclusive, a line is drawn through representing the mean of the measurements. (Appellant's Narrative, p. 125.) The difference between the discharge at a certain elevation and that at an elevation one foot higher, or one foot lower, was claimed to represent the increment. Thus, to determine the increment, it was necessary to do three things; *first*, to correctly measure the discharges of the rivers at the times made; *second*, to correctly determine what discharges are due to or correspond to the selected elevations; *third*, to correctly measure the difference in discharge between at least two elevations of the lake surface.

Having determined the increment, it was assumed that the lake was lowered by a diversion at Chicago equal to that fraction of a foot resulting from dividing the amount of the diversion by the increment of the outlet river as thus deter-

mined. (Appellant's Narrative, p. 127.) The greater the number of discharge measurements of the river whose increment it was sought to ascertain, and the greater the range of stage of the elevation of the controlling lake when the various discharge measurements were made, the more accurately would the increment of the outlet river be determined. (Appellant's Narrative, p. 145.) Thus errors in the discharge measurements of these great rivers and errors in the gauging of the surface elevations and in tying each discharge measurement to the proper elevation, would the more likely be eliminated. From a hydraulic standpoint, Michigan-Huron is treated as one lake, as their elevations are the same.

The witnesses for appellee concluded by means of these processes that the diversion through the Sanitary & Ship Canal of 10,000 to 14,000 cubic feet per second, was as follows:

Michigan-Huron 5. to approximately 6¾ inches.

Lake Erie, from 4 to 6 inches.

Lake Ontario, from 4 1/6 to 6 inches.

Lake Superior would not be affected. (Appellant's Narrative, p. 133.)

Appellant's expert testimony showed that the accuracy in determining the necessary data to ascertain the increment of the different outlet rivers, as above described, was not sufficiently perfect to enable the detection of a variation of flow of 10,000 cubic seconds feet, and thus the theoretical effect of the diversion through the Sanitary & Ship Canal could not be detected. (Appellant's Narrative, p. 140.)

The gauging sections of the different outlet rivers used in the measurements of the discharge to determine the increment, were several miles down the river from the respective controlling lakes. A discharge measurement was made at a certain time. It was then assumed that the stage of the lake at an estimated number of minutes before the time the discharge measurement was made, was the stage that con-

trolled the particular discharge at the time the measurement was made. (Appellant's Narrative, p. 145) The time interval estimate in tying the discharge measurement to the stage of the lake, or vice versa, was based upon certain assumptions made by some of appellee's witnesses, that the flow in the Sanitary & Ship Canal would be changed throughout from 4,167 seconds feet to 10,000 seconds feet in two to three hours from the time such change in flow was made at its southern terminus by lowering of the dams located there. This was found by actual tests to be entirely inaccurate, as it would take to accomplish this result not two to three hours, but at least twenty-four hours. (Appellant's Narrative, p. 390.)

Claimed damage to commerce.

It was not claimed by appellee that all vessels navigating the Great Lakes were or would be affected in their carrying capacity due to a lowering of the lakes surfaces, or that such lowering would affect any vessel at all places. It was claimed however, that there were certain critical points of navigation at which the depth of the water determined the depth to which large ore carrying vessels of the Pittsburg Steam Company could load; that these vessels, all built since the Sanitary & Ship Canal was opened, plied principally between points on Lake Superior and points on Lake Erie, thus passing through the locks at Sault Ste. Marie, St. Clair River, Lake St. Clair and the Detroit River. The locks at Sault Ste. Marie and places in the stretch of rivers and lake from Huron to Erie, were claimed to be critical points of navigation for these vessels. (Appellant's Narrative, p. 148.)

It was also claimed that these ore vessels carried about 81 to 100 tons for each inch of loaded draft; that based upon 25 trips per season, the vessels returning light, there would be loss of 11,150 tons per year; that assuming a freight rate of 55 cents per ton, a monetary loss would therefore exist of $6,000 per large vessel; that 72,000,000 tons of freight passed through the locks at Sault Ste. Marie during the year

1912, the greater part of which was carried in vessels of such size as to be affected by any loss of depth caused by the Chicago diversion. That therefore the loss to American vessels due to the diversion of 10,000 seconds feet, would be a million dollars per annum. (Appellant's Narrative, p. 149.)

Appellant claimed that the lowering of the lake surfaces of the small amount testified to by appellee's witnesses would not materially affect navigation; that these ore carrying boats could not load within such narrow limits; that the flow into each lake is constantly varying as is the discharge, affecting their levels; that there are also daily and hourly changes due to winds and barometric disturbances of from 6 inches to a number of feet (Appellant's Narrative, p. 150) and as is shown on plates attached to the report of the Board of Engineers, entitled "Waterway from Lockport, Illinois, to the mouth of the Illinois River," dated August 13, 1913, and made pursuant to the Rivers & Harbors Act of June 25, 1910, an extract from said report and a typical plate being shown in Appellant's Narrative (p. 150).

The unimportance of a few inches is shown by the failure of the appellee to remove a platform over the floor of the Poe Lock, which reduced the available depth of the Poe Lock approximately 0.33 of a foot, or about 4 inches. This condition existed from the time it was available for navigation in 1898 to 1913 when Mr. Ripley testified as to such condition. (Appellant's Narrative, p. 154.)

All boats claimed to be affected by the Chicago diversion, were built after the diversion began. (Appellant's Narrative, p. 159.)

The reference plane for the navigation improvement project of 1903, of the critical points of navigation between Lake Superior and Erie ports provided for by Congress, was fixed by the Engineer Corps six inches lower because of the diversion of 10,000 seconds feet at Chicago. (Appellant's Narrative, p. 155.) In other words, these critical points of navigation were dredged and deepened six inches lower than they

would have been had the Chicago diversion not existed, and navigation was thus protected from the claimed effects of the Chicago diversion.

Taking all the boats that could possibly be affected, namely 93 vessels of the 500 foot class, and 73 vessels of the 600 foot class, it was estimated that they could have been built longer without affecting their handling or cost of operation to carry an additional amount equal to the claimed loss of tonnage due to the smaller draft. The estimate for 3 inches less draft for all these boats in cost of constructing them in that manner, 93 of the 500 foot class and 73 of the 600 foot class, is $1,404,300 and $1,197,200, respectively. (Appellant's Narrative, p. 159.)

It is inaccurate to take the supposed loss or tonnage per inch and multiply it by the freight rate per ton to determine the monetary loss due to one inch less depth. There is only so much tonnage to carry by boats of the classes affected, and the loss is therefore represented by the extra cost of transporting the tonnage with the boats affected carrying the smaller cargo. (Appellant's Narrative, p. 159.)

Taking all these things into consideration, it is determined that the cost of transporting tonnage carried by the vessels of the 500 and 600 foot class for each inch loss of draft is 0.116 cents per ton. Calculating the number of trips for each vessel of the total affected—166—and the decrease in tonnage carried per year, the total capitalized loss which represents the entire loss for 3 inches loss in draft, is for 15 trips $1,848,600; for 20 trips $2,461,800; for 25 trips $3,076,200. The 166 vessels mentioned carried 37,000,000 tons of freight during the year 1912. On this basis, the loss per year for 3 inches loss in draft would be $128,760. Capitalizing this sum at 5%, is $2,575,200 as the total loss. (Appellant's Narrative, p. 159.)

The average number of trips of vessels loading beyond 18.1 feet passing through the locks of the Sault, is 14.12 per year, and this represents the 166 vessels mentioned. (Appellant's Narrative, p. 159.)

The cost of deepening the channels of the St. Mary's River, St. Clair River, channel in Lake St. Clair and those of the

Detroit River for 4 inches, is $163,990; 8 inches $403,854. The cost of deepening the harbors, including, also, the said channels, is 4 inches—$2,163,454; 8 inches—$4,405,008. The capitalized maintenance for 4 inches is $728,510; for 8 inches $1,092,766. (Appellant's Narrative, p. 160.)

A table was prepared showing the ports from and to which ore was carried and the amount for each port, during the fiscal year ending June 30, 1921; also a table was prepared showing the project depths as fixed by Congress up to the year 1922 for these various ports, including the critical points of navigation above mentioned—the St. Clair River and Livingston Channel in the Detroit River; also the table showed the actual depths of water for the low water years since the drainage channel was opened. This table shows that at no time was the actual depths of water at these ports and critical points of navigation, lower than the project depths as fixed by Congress. (Appellant's Narrative, pp. 161, 162.)

WORKS MAY BE CONSTRUCTED AT LITTLE COST TO OFFSET OR COMPENSATE FOR THE CLAIMED LOWERING OF THE ELEVATIONS OF THE LAKES, KNOWN AS COMPENSATING OR REGULATING WORKS.

It has long been established that submerged weirs or dams may be constructed and so placed in the outlet rivers such as St. Clair, Niagara and St. Lawrence Rivers, that the flowage capacity of these rivers will be contracted to an amount equal to the Chicago diversion of 10,000 or 14,000 cubic seconds feet. Thus the levels of the lakes would be restored and navigation would not be injured. (Appellant's Narrative, p. 164.)

These are called compensating works. Another kind of works effects the same purpose in a different way and are known as regulating works. They consist of movable dams placed in the outlet rivers so that at times the river may be more contracted than at others. These works are operated to maintain the levels of the controlling lake at an even stage; that is, the lake will not at the time of small supply reach the low stage that it would in natural conditions, nor will it reach as high a stage. The operation of the works would entirely off-set and take care of the diversion and give better navigation facilities. (Appellant's Narrative, p. 166.) For years works of this kind have been maintained and operated in the St. Mary's River and the stage of Superior has been controlled and the flow of the St. Mary's River regulated. (Appellant's Narrative, p. 176.) The International Waterways Commission and other Boards of Engineers have recommended the installation of such works. The Board of Engineers on Rivers & Harbors reporting under the above mentioned resolution of June 30, 1917, with reference to all diversions from the Great Lakes, recommended that regulating works be installed not only to take care of the effect of all diversions from the Great Lakes affecting the levels, including that of appellant, but also for the purpose of providing

better navigation facilities than would have existed under natural conditions. (Appellant's Narrative, p. 102.)

The Special Board of Engineers appointed under the Rivers & Harbors Act of June 25, 1910, made its report on August 15, 1913. This report was reviewed by the Board of Engineers for Rivers and Harbors in a report dated December 16, 1913, all of which was transmitted to Congress in the year 1914 (Appellant's Narrative, p. 176) known as H. R. 762, 63rd Congress, 2nd Session. The Special Board reporting, as stated, under date of August 15, 1913, found that

> "To restore the diminished levels in the lakes by constructing contracting works in their outlets, does not, however, present any serious difficulties";

also that

> "At the foot of Lake Ontario the closure of the Gut channel of the Galops Rapids by the Canadian Government has had the effect of raising the level of Lake Ontario an amount nearly equal to the computed lowering of the lake by a diversion of 10,000 second-feet at Chicago, and no compensation is at present deemed necessary to restore former conditions in this lake. (Appellant's Narrative, p. 176.)

Submerged weirs were recommended by the Board to be constructed in the Niagara River, also in the St. Clair River, to raise the levels of Erie and Michigan-Huron. (Appellant's Narrative, p. 176.)

In speaking of the works proposed to be constructed in the St. Clair River, the report stated:

> "It is computed that these weirs will increase the velocity of the water flowing over them slightly (from a mean of 3.28 feet to 3.89 feet per second) but, on the other hand, above the mouth of the Black River the river slopes, and velocities which are now excessive will be diminished *and navigation on the whole will be benefitted*".

The Board of Engineers for Rivers and Harbors, in reviewing the report of the Special Board above mentioned,

by its report of December 16, 1913, recommended (Appellant's Narrative, p. 171)

> "that the total volume of water to be diverted from the natural discharge channels of the lakes should be definitely fixed by Congress; that a project, with estimate of cost, for works necessary to compensation for such diversion, be prepared to the satisfaction of the Chief of Engineers and the Secretary of War; that before any diversion is made beyond that at present existing, the State of Illinois shall transfer to the Secretary of War the funds necessary for such works as given by the approved estimate of cost; that the works shall be built by the United States with the funds so provided, and that the control and maintenance of such works shall be in and at the cost of the United States".

The estimate of the cost of constructing the compensating works in the St. Clair and Niagara Rivers, as reported by the Special Board, was $475,000, and the annual cost of maintenance was $15,000. (Appellant's Narrative, p. 176.)

IF DIVERSION LIMITED TO 4,167 SECONDS FEET, ILL EFFECTS CANNOT BE OVERCOME.

In 1914 appellant made an estimate of the cost of constructing works that would be necessary if the diversion were limited to 4,167 seconds feet, and it was not permitted to divert the amount fixed according to the capacity of the Sanitary & Ship Canal, and the results of this investigation were produced in evidence that year. The sewer system of Chicago is what is called the combined system, that is, the sewers carry the sewage coming from the houses, buildings and factories and other places, as well as the storm and drainage water from the streets and ground surface. (Appellant's Narrative, p. 178.) These sewers principally and must necessarily discharge into the Chicago River or its branches (Appellant's Narrative, p. 179.) If the diversion is limited to 4,167 seconds feet, it would be necessary to artificially purify all sewage and let the effluent from these works discharge into the Chicago River, its branches and the Drainage Canal. The art of artificially purifying sewage has been in a state of change or flux—that is, one method would no sooner be adopted by engineers as the proper method to purify sewage, than it would be discarded for some other or newer method, which in turn would receive like treatment. (Appellant's Narrative, p. 257.) In the next place, it is impossible by artificial sewage purification works to completely produce an effluent from them that would not pollute the water supply if allowed to reach it. (Appellant's Narrative, p. 258.) With the diversion limited to 4,167 seconds feet, there would be many times during each year when the water of the Chicago River and its branches would flow into Lake Michigan, polluting the water supply. (Appellant's Narrative, p. 209.) No works could be constructed to purify the sewage arising in appellant's territorial limits, to take the place of the diversion required in excess of 4,167 second feet, without not only endangering the water supply, but also actually polluting it.

(Appellant's Narrative, p. 220.) It would take years to construct such works, even if the funds could be provided. As before stated, appellant made investigations of the cost of constructing works to supplement the diversion of 4,167 seconds feet and partially take the place of the additional diversion required. It is unnecessary to here state the details of such plans as they appear in the record and in appellant's narrative (p. 217). We will merely give the estimate of cost.

The estimated cost for the installation of such works, in 1914, including capitalized cost of operation, if the flow were limited to 4,167 seconds feet, was $183,000,000, assuming maximum 10,000 seconds feet; $220,000,000 assuming maximum 12,000 seconds feet, the present capacity of appellant's diversion works, and $257,000,000, assuming maximum 14,000 seconds feet, the total capacity of the Sanitary and Ship Canal in the rock section. The above estimates are based upon the assumption that there will be in a short time a population large enough to require the 12,000 and 14,000 cubic seconds feet to oxidize the sewage of this additional population. (Appellant's Narrative, 217.)

After the above mentioned facts and estimates were presented in the record, appellant submitted (April 25th and 26th, 1923), evidence showing that works to supplement the diversion of 10,000 cubic seconds feet, that is, to artificially purify the sewage and other wastes in excess of the population equivalent of three million people, would cost upwards of one hundred million dollars, and they could not be installed prior to the year 1945. (This Brief p. 79.)

OPINIONS OF THE DISTRICT COURT.

The case was submitted on the 15th of February, 1915, to District Judge Kenesaw Mountain Landis, upon printed record and printed briefs and argument, a brief of facts and a brief on the law being tendered by each party. All of the evidence mentioned hertofore, except the tables showing the carriage of ore for the year 1921 and the table showing the project depths in comparison with actual depths at low water times since the opening of the Drainage Channel and the reference to the report made under the resolution of June 30, 1917, as to the regulating works to off-set for diversions, was presented during the period beginning with the year 1908 and ending January, 1915. Certain other evidence was presented on the 25th and 26th of April, 1923, in connection with the motion made on July 12, 1920, about to be mentioned.

OPINION OF JUDGE LANDIS.

Judge Landis, having had the case under advisement from February 15, 1915, on June 20, 1920, rendered an oral opinion or direction for the preparation of a decree. This opinion was taken down in shorthand and transcribed, but never was signed by the Judge, and no other written memorandum signed by Judge Landis of his opinion exists. (Appellant's Narrative, p. 95.) In substance the Court found the issues with the appellee, and directed that a decree be prepared enjoining the appellant from abstracting water from Lake Michigan in excess of 4,167 seconds feet, as prayed by the complaint of October 6, 1913.

MOTION OF APPELLANT, FOLLOWING OPINION OF JUDGE LANDIS.

On July 12, 1920, appellant presented a motion that the Court

> "reconsider its oral opinion and oral direction heretofore announced concerning the form of decree to be entered in the said causes, and that the court direct that The Sanitary District of Chicago, defendant, be enjoined, only, from withdrawing or diverting from Lake Michigan, through its various works now constructed or under construction, more than ten thousand cubic feet of water per second from Lake Michigan on condition that if the Congress of the United States, or other competent governmental authority, provides for the construction of, in St. Clair, Niagara or St. Lawrence rivers, or in one or all of them, works to compensate for any diminishing levels of the Great Lakes and connecting waters, due to the diversion or withdrawal of ten thousand cubic feet of water per second from Lake Michigan by The Sanitary District of Chicago, then The Sanitary District of Chicago shall defray the expense and pay the cost of the construction and maintenance of any such works upon request therefor by the United States of America. In connection with said motion, and as a part thereof, the defendant hereby offers and agrees to defray the expense or pay to the United States upon demand the cost of the construction and maintenance of the works of the character above described in accordance with an ordinance of the Board of Trustees of The Sanitary District of Chicago passed and approved by said Board on the 8th day of July, A. D. 1920, a copy of which said ordinance is hereto attached and marked Exhibit 'A', a certified copy of which is here ready to be produced in court. In support of said motion, and as grounds therefor, the defendant alleges and shows the following:" (Appellant's Narrative, p. 98.)

Appellant also by said motion set up the various proceedings in the case and the issues, and alleged principally that it was an undisputed fact in the record that compensating works could be constructed to off-set for the supposed lowering of the lake surfaces and their connecting channels. The ordinance of the Board of Trustees of appellant offering to

defray the expense of constructing these compensating works was set forth by attaching a copy thereof as an exhibit to the motion. There were other facts set forth in the motion that are not here pertinent to be mentioned. The motion was partially heard by the Court on the 12th of July, 1920, and further hearing was postponed. Finally, on March 1, 1922, Judge Landis ceased to be a Judge of the District Court by reason of his resignation. Thereafter the motion was heard before Judge George A. Carpenter of said District Court.

Appellant desired and asked that Judge Carpenter, the successor judge, hear all questions involved in the case, as well as said motion, in view of the fact that there was no memorandum signed by Judge Landis showing his conclusions. There was nothing upon which the successor judge could act except the pleadings and evidence in the record. However, Judge Carpenter refused to go into the merits and heard only argument upon the motion, and thereafter, on July 18, 1923, entered a decree enjoining the appellant, according to the prayer of the bill. At the same time he rendered an opinion orally, which was thereafter signed by him. (Appellant's Narrative, p. 113.)

In connection with said motion, prior to the entry of the decree and prior to Judge Carpenter's rendering his opinion as aforesaid, appellant offered evidence showing that on August 7, 1919, in cooperation with the United States Engineer at Chicago, Colonel Judson, its Board of Trustees, by ordinance, adopted a program for the construction of artificial sewage disposal works to supplement a diversion of 10,000 cubic seconds feet of water from Lake Michigan whereby over a period of twenty-five years appellant should construct and place in operation progressively works, so that at the end of said period of twenty-five years, the sewage of the increase of population and trade wastes, would be taken care of by these supplementary works. (Appellant's Narrative, p. 110.)

It also appeared from this evidence that the trade wastes, including the stockyards and tanneries entering the San-

tary & Ship Canal from the sewers of Chicago, would require as much water to dilute it as would be necessary to take care of the sewage of a million and a half of people. The population of the Sanitary District within the territorial limits of appellant was then approximately 3 million people. Thus the human sewage and wastes had a population equivalent for dilution equal to that of almost 5 million people. The increase in waste and human sewage would give an equivalent by 1945 of approximately 7 million people. (Appellant's Narrative, p. 362.) The total cost of these works would be upwards of a hundred million dollars (Appellant's Narrative, p. 366.)

Using all the financial resources of the District from taxation and issuance of bonds, funds could not be provided to install the works to take care of the sewage and wastes undisposed of by 10,000 seconds feet diversion, so that the works could be completed prior to 1945. At that time there would still be required 10,000 seconds feet diversion to take care of the sewage and wastes not treated. (Appellant's Narrative, p. 368.)

Before the diversion could be reduced below 10,000 seconds feet, it would be necessary to install filtration plants to filter the water supply, because with the diversion limited to 4,167 second feet or any amount materially lower than 10,000 seconds feet, the water supply would at times be polluted by the Chicago River flowing into Lake Michigan, carrying with it sewage and wastes. Under no circumstances could danger of such condition taking place be permitted without the entire water supply being filtered. (Appellant's Narrative, p. 365.) Therefore, in the year 1945, when the artificial sewage disposal works are constructed to supplement the 10,000 seconds feet diversion, taking care of the increase and the overloading of the Sanitary & Ship Canal, it would be necessary to begin the construction of filter plants at a cost of approximately 200 million dollars. (Appellant's Narrative, p. 366.)

Appellant is not authorized to actually take water out of the lake and disseminate it by means of mains and other devices

to the consumer. This duty rests upon the cities and towns within its limits. The cost of filtration plants is estimated at about $100,000,000 and the annual operating cost is about $3,500,000. Whether these cities and towns can ever,—or, if able, when they can—build these filtration plants, does not appear. They were not before the court as defendants or otherwise. (Appellant's Narrative, pp. 366, 367.)

It appeared that if the diversion were immediately limited to 4,167 seconds feet, the Chicago River would immediately become a polluted stream and a public nuisance (Appellant's Narrative, p. 208.) At times of storm many times during each year it would flow into Lake Michigan, polluting the water supply, causing epidemics of typhoid fever and other water born diseases, creating a condition as bad as that which existed prior to the opening of the Sanitary & Ship Canal. In addition,the Drainage Canal itself would become a public nuisance, the DesPlaines and Illinois Rivers would likewise be a public menace, all fish life there would be destroyed by reason of the sewage exhausting the oxygen content of the water, and generally an intolerable condition would result. (Appellant's Narrative, p. 209.)

Opinion of Judge Carpenter.

On June 18, 1923, Judge Carpenter rendered an opinion on which various decrees and orders were entered.(Appellant's Narrative, p. 113.) The opinion stated that it overruled the motion made by appellant, July 12, 1920, for reconsideration of Judge Landis' direction for a decree. The opinion further stated:

> "The record shows that the Sanitary District of Chicago has expended in its work some hundreds of millions of dollars; and the evidence shows rather conclusively that no other system of disposing of the sewerage in the great district covered would work so well as that devised by the Sanitary District. The City of Chicago, since the Drainage District began to operate, has practically doubled in population. The district served by the Sanitary District holds more people than over forty states in

the Union. The rate of typhoid fever since the completion of the Drainage Canal has been reduced from seventy-five per hundred thousand to a negligible number.

The testimony of Government engineers shows that it would take from ten to twenty-five years for the Drainage District to erect sewerage treatment and disposal works to handle the sewerage within the Drainage District, if the flow of water was reduced from 10,000 to 4,167 cubic feet per second.

This matter is a subject which needs the consideration of thinking people, not only in the State of Illinois, but in the whole United States. The Treaty with Canada entered into some years ago seemed to contemplate an acquiescence on the part of the Canadian Government to the withdrawal of 10,000 cubic feet a second by the Drainage District. However that may be, the Secretary of War has not given his official consent. Whether the increased withdrawal should or should not be made is properly a political and not a legal question, in the absence of consent by the Secretary of War. The Legislature of the State of Illinois, the various civic bodies, the Association of Commerce, and senators and representatives should see to it that at the earliest possible moment the situation here is brought to the attention of Congress, so that by appropriate legislation the health and welfare of this great community may be safeguarded. I have no doubt that when the matter is properly presented it will be taken up by Congress and by the State Department, and some plan devised which will bring about adequate and the desired results.

It goes without saying that this Court will not issue an injunction to be effective forthwith. It cannot impose the conditions so strenuously urged by the attorneys for the Sanitary District. It is doubtful whethere the State of Illinois could authorize expenditures to be made in foreign states and foreign countries to restore the water levels.

On the testimony of the Government engineers the Court might, in the exercise of a sound discretion, delay the effectiveness of its injunction for from fifteen to twenty-five years to enable the Sanitary District or the State of Illinois to arrange for other means of disposing of the sewerage now handled by the Sanitary District.

Believing as I do that it is a matter for the immediate action of Congress, a decree may be prepared finding the facts as stated in the Bill and enjoining the defendant

from withdrawing from Lake Michigan in excess of 4,167 cubic feet a second; the decree, however, not to go into effect for six months."

Orders and Decree for Injunction.

On the same day, the opinion was rendered by Judge Carpenter June 18, 1923, an order was entered denying the said motion made by appellant on the 12th day of July, 1920, requesting that it be not enjoined or restrained from withdrawing from Lake Michigan less than 10,000 cubic seconds feet of water. (Appellant's Narrative, page 116.)

At the same time the following decree for injunction was entered:

"This cause came on to be further heard at this term, and was argued by counsel; and thereupon, upon consideration thereof, it was ordered, adjudged and decreed as follows, viz:

That the defendant, the Sanitary District of Chicago, its Board of Trustees, officers, agents, attorneys, representatives, employees and servants, and all other persons acting or claiming or assuming to act under its authority, be, and they hereby are, and each of them hereby is, enjoined from diverting or abstracting any waters from Lake Michigan over and above or in excess of 250,000 cubic feet per minute.

The operation of this injunction is hereby stayed for a period of six months to enable the defendant to present the record herein to the Supreme Court of the United States." (Appellant's Narrative, page 117.)

Thereafter, on June 29, 1923, the appeal was allowed, assignment of errors was filed and an order was entered staying the injunction during the pendency of the appeal. (Appellant's Narrative, page 117.)

ERRORS UPON WHICH APPELLANT RELIES.

The injunctional decree was erroneous because (Appellant's Narrative, p. 118.)

(*a*) Plaintiff is not entitled to the injunction granted, and plaintiff's bill should have been dismissed. (Ass. 1.)

(*b*) Under the commerce clause of the Constitution, Article 1, Section 8, Clause 3, neither Congress nor any officer of the United States has power to regulate or limit the State of Illinois or The Sanitary District of Chicago in diverting water from Lake Michigan for public welfare in the exercise of the state's police power. (Ass. 2.)

(*c*) The Act of the General Assembly of Illinois of May 29, 1889, under which The Sanitary District was organized, expressly directs defendant to divert and abstract 20,000 cubic feet of water per minute for each 100,000 population of the district, such population being approximately 3,000,000 people. (Ass. 3, 4, 5, 6, 7)

(*d*) Said Act of May 29, 1889, of the General Assembly of Illinois, was passed for the sole and only purpose of preserving health and protecting life under the state's police power, and neither Congress nor any officer of the United States can interfere with the reasonable exercise of such police power. (Ass. 8.)

(*e*) The Act of May 29, 1889, of the General Assembly of Illinois and the construction and operation of the works provided to be built thereunder, cannot be interfered with by the United States, when the primary and sole purpose of such legislation and operation of said works is for public health and welfare of the people of the state and the impairment of navigation, if any, is only the indirect result of the operation of said Act of the General Assembly of Illinois and the works constructed thereunder. (Ass. 9.)

NOTE: We will not here state the assignment of errors with particularity or detail, but will set forth merely the substance.

(*f*) The pure, wholesome, potable drinking water supply for the people of Chicago, its environs and those within the territorial limits of the defendant, the disposal of the sewage of said people, and the diversion of same from the water supply, can only be obtained through the operation and maintenance of defendant's diversion works constructed under said Act of the General Assembly of Illinois of May 29, 1889, requiring a diversion of 20,000 cubic feet of water per minute for each 100,000 of population (population now upwards of 3,000,000 people.) (Ass. 10, 11, 12, 13 and 14.)

(*g*) With the diversion limited to 250,000 cubic feet of water per minute, as required by said injunction, works to artificially dispose of sewage supplementary to said diversion and works to filter the water supply of the people, cannot be constructed within a period of less than twenty years, by reason of the inability of the Sanitary District, defendant, to raise funds therefor by taxation and by the issuance of bonds. (Ass. 15, 16, and 17)

(*h*) The Act of Congress of March 2, 1827, entitled "An Act to grant a quantity of land to the State of Illinois for the purpose of aiding in opening a canal to connect the waters of the Illinois River with those of Lake Michigan", authorized the State of Illinois to build the main channel of the defendant, Sanitary District, supplementary to or in place of the old Illinois Michigan Canal constructed in 1848, and to divert from Lake Michigan for said main channel at least 600,000 cubic seconds feet of water per minute and in excess of 250,000 cubic feet per minute fixed by said injunctional order. (Ass. 18, 19, 20, 21 and 22)

(*i*) The United States had full and complete knowledge of the passage of the Act of May 29, 1889, providing for the construction of the main channel of the Sanitary District with its attendant diversion, the progress of construction, completion, and the purpose of such works and invited and acquiesced in said diversion provided by said Act of May 29, 1889, and is estopped to interfere with it. (Ass. 23)

(*j*) Congress has by various acts fixed the project depths of all harbors and connecting waters of Lake Superior, Michigan, Huron, Erie and Ontario, and the actual depths of water in such harbors and connecting waters has not been less than the project depths fixed, notwithstanding defendant's diversion. (Ass. 24 and 25)

(*k*) The cost and financial burden resulting to the defendant by virtue of the said injunction and the limitation of said diversion is great, amounting to upwards of $250,000,000 and the damage to plaintiff by reason of the alleged injury to navigation is slight, and all claimed damages to navigation may be offset or compensated for by construction of compensating works, which cost would not exceed $475,000. (Ass. 26-28)

(*l*) The offer of defendant to pay the cost of constructing and maintaining compensating works to offset for the alleged lowering of the surface elevation of the Great Lakes system, on condition that the decree to be entered should only enjoin defendant from diverting in excess of 10,000 cubic feet of water from Lake Michigan, should have been accepted by the Court and a decree entered as requested by the defendant upon the condition that defendant comply with such offer. (Ass. 29-30)

(*m*) Congress has by various acts appropriated money for and required surveys and reports for a waterway from Chicago to the Gulf of Mexico, whereby the diversion of water by the defendant to the amount of 600,000 cubic feet per minute would be utilized and has by various acts also required surveys as to the means of offsetting or compensating for the lowering of the surface elevations of the Great Lakes system by said diversion, and has thereby indicated that it treated the said diversion by the defendant as existing, and did not intend to disturb it. (Ass. 31-32)

(*n*) Act of Congress of June 29, 1906, relating to the diversion of water from the Niagara River, known as the Act for the Preservation of Niagara Falls, expressly prohibits

interference with diversions from the Great Lakes for sanitary or domestic purposes except as Congress might in the future provide. (Ass. 33)

(*o*) The works of the Sanitary District were commenced prior to the passage of the Rivers and Harbors Act of September 19, 1890, and such works are recognized by said act as authorized by law. (Ass. 34)

(*p*) Sections 9 and 10 of the Rivers and Harbors Act of March 3, 1899, do not authorize the Chief of Engineers or the Secretary of War in any manner to supervise or regulate or control the diversion of water by the defendant. (Ass. 35-36-37)

(*q*) Permit of May 8, 1899, authorized the Sanitary District to open its main channel and was without limitation as to amount except the capacity of the main channel of the Sanitary District as fixed by law. This permit was subject to a condition only as to limitation of flow—that if the current should be unreasonably obstructive to navigation in the Chicago River, the Secretary of War might modify the discharge from Lake Michigan through the river. Thereafter, due to the then shallowness and narrowness of the Chicago River, its South Branch and West Fork, the Secretary of War ordered the flow limited to 250,000 cubic feet per minute. Because of such limitation for the purpose of providing for the greater flow of 10,000 cubic seconds feet, the Sanitary District, with the consent and approval of the Secretary of War, widened and deepened the channels of said rivers at a cost of approximately $13,000,000 so that there could be withdrawn through said river channels the amount of water required by said Act of May 29, 1889, without injury to navigation. Thereafter the Secretary of War or other officer of the United States was without authority to enforce the order limiting the withdrawal to 250,000 cubic feet per minute, made because of the then narrowness and shallowness of the channels of said rivers. (Ass. 38-39-40-41)

(*r*) The abstraction and withdrawal of water from Lake Michigan by defendant to the amount of 600,000 cubic feet of water per minute, or 10,000 per second, has not and will not impair the navigable capacity of any of the navigable waters of the United States, such impairment has not been observed by any lay witnesses, navigator or captain of any ship, or any one engaged in navigation. Such claim is only the result of the analyses of expert witnesses. (Ass. 41-42-43-44-45-46-47-48-49.)

(*s*) Defendant cannot observe the injunctional decree without causing pollution of the water supply of upwards of three million people within defendant's limits, from which would result epidemics of typhoid fever and other water-born diseases. (Ass. 50-51)

(*t*) Injunctional decree herein holds unconstitutional the Act of General Assembly of Illinois of May 29, 1889, under which the Sanitary District, the defendant, was organized. (Ass. 52)

(*u*) Treaty between the United States and Great Britain of January 11, 1909, concerning Canadian boundary waters, recognizes the diversion by the defendant to the amount of 10,000 cubic feet of water per second and precludes an injunction herein as to any diversion of 10,000 cubic feet seconds or less. (Ass. 53-54-55)

(*v*) It does not appear from the evidence that the diversion proposed by the defendant pursuant to said Act of May 29, 1889, under all the facts and circumstances, has obstructed or would unreasonably obstruct navigation. (Ass. 56-57 and 60)

(*w*) Decree herein enforces an arbitrary and unreasonable course pursued by the Secretary of War and the Attorney General. (Ass. 58)

(*x*) The Court should have balanced the equities and in so doing should have refused the injunction and dismissed the complainant's bill for want of equity. (Ass. 59)

(*y*) Congress will not be deemed to have acted concerning a matter of local regulation such as is embraced in the Act of the General Assembly of May 29, 1889, providing for defendant's diversion works, unless it has passed some special law with reference to the alleged obstruction. (Ass. 61)

BRIEF.

Appellant's Narrative 17, 21.

Sections 7 and 10, Rivers and Harbors Act, September 19, 1890.

Laws Improvement of Rivers and Harbors, Vol I, p. 582. U. S. Stat. at Large, Vol. 26, p. 426.

Sections 9, 10 and 12, Rivers and Harbors Act of March 3, 1899.

Laws Improvement of Rivers and Harbors, Vol. 2, p. 886.* U. S. Stat. at Large, Vol. 30, p. 1121.

I.

The diversion by appellant to the amount provided for under the Act of Illinois of May 29, 1889, under which appellant was organized and exists, has been "affirmatively authorized by law" (River and Harbors Act of September 19, 1890). Likewise, it has been "affirmatively authorized by Congress" (Rivers and Harbors Act of March 3, 1899).

(a) Appellant was organized under an Act of the General Assembly of Illinois passed in the exercise of the state's police power. This Act fixed appellant's powers and duties, and specified the required diversion of water from Lake Michigan.

Wilson v. *Board of Trustees,* 133 Ill. 443, 465.
People v. *Nelson,* 133 Ill. 565, 580, 582, 592, 594.
Beidler v. *The Sanitary District of Chicago,* 211 Ill. 628, 638.

*For convenience in referring to Rivers and Harbors Acts, we cite Document Number 1491, 62nd Congress, 3rd Session, entitled "Laws of the United States Relating to Improvement o.. Rivers and Harbors, August 11, 1790 to March 4, 1913." Sufficient copies have been furnished the Clerk.

Pittsburg, Fort Wayne & Chicago Railway Company v. *The Sanitary District of Chicago*, 218 Ill. 286, 287, 295.

Appellant's Narrative, p. 92.

United States v. *Bellingham Bay Boom Co.*, 176 U. S. 211.

(*b*) The diversion of water from Lake Michigan to operate the Sanitary & Ship Canal of appellant has been authorized by the Act of Congress of March 2, 1827. (Appellant's Narrative, p. 412.)

Appellant's Narrative, pp. 404, 405, 406, 410, 411, 408, 412.

Missouri v. *Illinois*, 200 U. S. 496, 519, 526.

Mortell v. *Clark*, 272 Ill. 201, 213.

Appellant's Narrative, p. 415.

Vol. 5, Messages and Papers of the Presidents, p. 3334.

Statement, p. 19.

Appellant's Narrative, pp. 448, 447.

Rec., Vol. IV, 2172.

(*c*) Appellee, through its engineer officers and the Secretary of War, observed the action of the State of Illinois and appellant pursuant to its authority in planning and constructing the diversion works. The Secretary of War consented to the work necessary to accomplish the diversion and authorized the opening of the main channel of the district. The Secretary of War construed the Congressional Act of March 2, 1827, and the laws of Illinois, as affirmatively authorizing the diversion.

Appellant's Narrative, pp. 451, 453, 464.

Statement, p. 48.

Appellant's Narrative, pp. 487, 454, 88, 474, 475, 23, 92, 90, 91.

(*d*) The Secretary of War, charged with the duty of enforcing the Rivers and Harbors Acts of September 19, 1890,

and March 3, 1899, has thus construed a diversion to the capacity of appellant's Sanitary and Ship Canal, to have been "affirmatively authorized by law" and "affirmatively authorized by Congress." These acts of the Secretary of War should have the force of judicial interpretation.

Hastings & Dakota Railroad Company v. *Whitney*, 132 U. S. 357, 366.

U. S. v. *Moore*, 95 U. S. 760, 763.

Shells Executors v. *Fauche*, 138 U. S. 562, 572.

Heath v. *Wallace*, 138 U. S. 573, 582.

II.

The permits of the Secretary of War of July 11, 1900, authorizing the work of deepening and widening the channels of the Chicago River to provide for the diversion or abstraction from Lake Michigan through them of the amount of water required by the state law according to the population of appellant, constituted all the authority required by appellant from appellee, to divert said waters.

Appellant's Narrative, p. 28.

Maine Water Company v. *Knickerbocker Steam Towage Company*, 99 Maine 473.

Sections 7 and 10, Rivers and Harbors Act of September 19, 1890. (Argument p. 106.)

Sections 9, 10 and 12, Rivers and Harbors Act of March 3, 1899. (Argument, p. 116.)

Maine Water Company v. *Knickerbocker Steam Towage Company, supra*, p. 477.

The altering or modifying of the navigable capacity of the waters, not only of the Chicago River and its branches, but of Lakes Huron, Michigan, Erie, Ontario, their connecting waters, and other navigable waters of the United States, by the diversion of water provided for through appellant's works, was thus authorized and is lawful.

Cummings v. *Chicago*, 188 U. S. 410.

Hubbard v. *Fort*, 188 Fed. 987.

Maine Water Company v. *Knickerbocker Steam Towage Company, supra.*

Hudson County Water Company v. *McCarter*, 209 U. S. 349.

III.

In any event, the Secretary of War has authorized the opening of appellant's Sanitary & Ship Canal, its operation and attendant diversion of water from Lake Michigan by the permit of May 8, 1899, every condition of which has been fulfilled, assuming such conditions to be valid. The Secretary of War was only authorized to grant or refuse a permit. He had no power to regulate the diversion of water at Chicago. The Attorney General had no authority to institute the suit for injunction.

(*a*) The effect of the May 8, 1899 permit and attempted limitation thereon.

Appellant's Narrative, pp. 90, 91, 23, 26, 202, 194, 2, 12, 526.

Statement, p. 51.

Monongahela Bridge Co. v. *U. S.*, 216 U. S. 177, 195.

Philadelphia Company v. *Stimson*, 223 U. S. 605.

Kwock Jan Fat v. *Edward White, as Commissioner of Immigration*, 253 U. S. 454, 464.

(*b*) The Attorney General under the Act of March 3, 1899, is only authorized to institute suits in equity for the removal of structures. The District Court was without jurisdiction to entertain this suit or enter the decree.

Appellant's Narrative, p. 21.

Laws, Improvement of Rivers and Harbors, Vol. 2, p. 887. (Argument p. 106.)

Laws, Improvement of Rivers and Harbors, Vol. 1, p. 583. (Argument p. 106.)

Section 12, Act of March 3, 1899. (Argument p. 106.)

Ogden City v. *Boreman*, 20 Utah 98; 57 Pac. 843.

Endlich on Interpretation of Statutes, Sec. 51.

Sutherland Statutory Construction, Sec. 140.

U. S. v. *Rio Grande Dam & Irrigation Company*, 174 U. S. 690.

(*c*) The Secretary of War is only authorized to grant or refuse a permit. He has no power to regulate the diversion.

IV.

Regardless of the effect of the Act of Congress of March 2, 1827, providing for the construction of the Illinois and Michigan Canal across the continental divide, and the interpretation of Section 10 of the Act of March 3, 1899, as heretofore stated, nevertheless, the Illinois Act of May 29, 1889, under which appellant has built and is operating its diversion works, is valid and enforceable, pursuant to the police power reserved to the states under the Constitution. The diversion by appellant to the amount necessary for the operation of its works is lawful without express consent of the Secretary of War. Any other construction of the Act of March 3, 1899, would tend to nullify appellant's acts in the interest of public health. This result cannot obtain unless such congressional intention is expressed in plain and unmistakable terms.

(*a*) The Illinois Act of May 29, 1889, under which appellant was organized and exists, was sufficient legislative authority for the construction of appellant's various diversion works and for the diversion of water from Lake Michigan as required by such works.

Cummings v. *Chicago*, 188 U. S. 410, 427, 428, 430.

Montgomery v. *Portland*, 190 U. S. 89, 107.

VI.

The decree of the lower court is based solely upon the testimony of expert witnesses. No witness was produced by appellee to testify that the lowering of the lake surfaces or damage to commerce, was ever actually observed. Appellee's case depends entirely upon an inference of the unseen and the subtle analyses of expert witnesses, which cannot form the basis of an injunctional decree.

(*a*) Expert evidence in injunction cases.

Statement, p. 64.

Appellant's Narrative, pp. 125, 150.

VII.

A court of equity in determining whether or not it will grant an injunction looks not only to the naked legal rights of the complainant and the advantages to be by it gained, but also to the inconveniences and injuries to be sustained by the defendant. And if it appears that the granting of the injunction would cause comparatively greater injury to the defendant than it would cause benefit to the complainant, a court of equity will not hesitate to deny the relief.

City of New York v. *Pine*, 185 U. S. 93, 97.

VIII.

The statement made by the Secretary of War (January 8, 1913) in refusing to remove the alleged limitation by the order of December 5, 1901 (4,167 seconds feet withdrawal) and denying express authority of appellant to divert 10,000 cubic seconds feet, is immaterial. The statute does not authorize any findings or conclusions by the Secretary of War. If it did, the conclusions would be subject to review. In any event, the conclusions of fact and of law stated, are erroneous, as appears by the record of this case.

(*a*) The statute does not authorize the Secretary to make any findings or conclusions. If it did, such would be subject to review.

Appellant's Narrative, p. 176.

United States v. *Rio Grande Irrigation Company*, 174 U. S. 690.

IX.

The lower court should have granted the motion of July 12, 1920, by appellant, following the opinion of Judge Landis and his direction as to the drafting of a decree, that the appellant be only enjoined from taking in excess of 10,000 cubic seconds feet of water from Lake Michigan on condition that appellant pay the cost of constructing such compensating or regulating works as the United States should provide to be built to offset for the claimed lowering of the lake surfaces and their connecting channels due to 10,000 seconds feet diversion at Chicago. Admitting, for the sake of argument, only, all contentions of appellee to be true, appellant cannot be enjoined from taking an amount of water materially less than 10,000 cubic seconds feet from Lake Michigan, until appellant and cities and towns within its limits can, if at all, readjust their works of sewage disposal and of purification of water supply to suit the changed conditions.

(*a*) By granting the motion of appellant above mentioned, July 12, 1920, the lower court would have done equity. The construction of compensating or regulating works was entirely feasible, as the undisputed facts of the record show.

CONCLUSION.

ARGUMENT.

The complaint upon which the relief was sought here and upon which the decree was entered, was filed October 6, 1913. (Appellant's Narrative, p. 17.) The relief was asked under Section 10 of the Rivers and Harbors Act of March 3, 1899. (This Brief, p. 106.) The complaint alleges the issuance of the permit of May 8, 1899, by the Secretary of War for the opening of the channel, subject to the conditions:

(1) If Congress should act, the permit should be of no force or effect;

(2) If the current should prove unreasonably obstructive to navigation in the Chicago River, the Secretary of War might cut off the discharge or modify it.

(3) Appellant should be responsible for damages. (Appellant's Narrative, p. 21.)

The complaint also alleges various orders of the Secretary of War, beginning April 9, 1901, purporting to modify the discharge through the Chicago River because of objections of navigation interests to the current in that river. One of said orders is the one of the Secretary of War of the 5th of December, 1901, seeking to limit the discharge through the channel from Lake Michigan to 250,000 cubic feet per minute, or 4,167 per second; and it is alleged that the Secretary of War had never authorized an increase of withdrawal from Lake Michigan over that amount; that appellant has been and is withdrawing, and proposes further to withdraw from Lake Michigan much in excess of that amount, and, in fact, the amount fixed by its organic act—20,000 cubic feet per minute for each 100,000 of its population; that the withdrawal of this water injures the navigable capacity of Lakes Michigan, Huron, St. Clair, Erie, Ontario and their connecting

channels, navigable waters of the United States, and thereby commerce on the Great Lakes is damaged. The complaint asks an injunction against appellant's diverting more than 250,000 cubic feet per minute, the alleged limitation of the order of the Secretary of War of December 5, 1901.

Appellee's position, therefore, is based upon the validity of the action of the Secretary of War in fixing the limitation mentioned—4,167 cubic seconds feet of withdrawal.

As shown by the statement of facts, these works were constructed under the Act of May 29, 1889, of the General Assembly of Illinois, and were commenced immediately thereafter and before the Rivers and Harbors Act of September 19, 1890, was passed. The Sanitary & Ship Canal, the main diversion channel of appellant, was completed in 1898, and prior to the passage of said Rivers and Harbors Act of March 3, 1899. It was not, however, placed in operation until afterwards.

Sections 7 and 10 of the Rivers and Harbors Act of September 19, 1890, and Sections 9, 10 and 12 of the Rivers and Harbors Act of March 3, 1899, in most respects, are similar. As it will be necessary to construe the effect of these various sections, we will here, at the outset, set forth the above mentioned sections in juxtaposition.

Sections 7 and 10, Rivers and Harbors Act of September 19, 1890 (Laws, Improvement of Rivers & Harbors, Vol. I, p. 582)—

"*Sec.* 7. That it shall not be lawful to build any wharf, pier, dolphin, boom, dam, weir, breakwater, bulkhead, jetty, or structure of any kind outside established harbor-lines, or in any navigable waters of the United States where no harbor-lines are or may be established, without the permission of the Secretary

Sections 9, 10 and 12, Rivers and Harbors Act of March 3, 1899 (Laws, Improvement of Rivers & Harbors, Vol. 2, p. 886)—

"*Sec.* 9. That it shall not be lawful to construct or commence the construction of any bridge, dam, dike, or causeway over or in any port, roadstead, haven, harbor, canal, navigable river, or other navigable water of the United States until the consent of Congress to the building of such structures shall have been ob-

of War, in any port, roadstead, haven, harbor, navigable river, or other waters of the United States, in such manner as shall obstruct or impair navigation, commerce, or anchorage of said waters, and it shall not be lawful hereafter to commence the construction of any bridge, bridgedraw, bridge piers and abutments, causeway or other works over or in any port, road, roadstead, haven, harbor, navigable river, or navigable waters of the United States, under any act of the legislative assembly of any State, until the location and plan of such bridge or other works have been submitted to and approved by the Secretary of War, or to excavate or fill, or in any manner to alter or modify the course, location, condition or capacity of the channel of said navigable water of the United States, unless approved and authorized by the Secretary of War; *Provided*, that this section shall not apply to any bridge, bridge-draw, bridge piers and abutments and construction of which has been heretofore duly authorized by law, or be so construed as to authorize the construction of any bridge, draw bridge, bridge piers and abutments, or other works, under an act of the legislature of any State, over or in any stream, port, roadstead, tained and until the plans for the same shall have been submitted to and approved by the Chief of Engineers and by the Secretry of War: *Provided*, That such structures may be built under authority of the legislature of a State across rivers and other waterways the navigable portions of which lie wholly within the limits of a single State provided the location and plans thereof are submitted to and approved by the Chief of Engineers and by the Secretary of War before construction is commenced. *And provided further*, that when plans for any bridge or other structure have been approved by the Chief of Engineers and by the Secretary of War, it shall not be lawful to deviate from such plans either before or after completion of the structure unless the modification of said plans has previously been submitted to and received the approval of the Chief of Engineers and of the Secretary of War."

haven or harbor, or other navigable water not wholly within the limits of such State."

"*Sec.* 10. That the creation of any obstruction, not affirmatively authorized by law, to the navigable capacity of any waters, in respect of which the United States has jurisdiction, is hereby prohibited. The continuance of any such obstruction, except bridges, piers, docks and wharves, and similar structures erected for business purposes, whether heretofore or hereafter created, shall constitute an offense and each week's continuance of any such obstruction shall be deemed a separate offense.

"*Sec.* 10. That the creation of any obstruction not affirmatively authorized by Congress, to the navigable capacity of any of the waters of the United States is hereby prohibited; and it shall not be lawful to build or commence the building of any wharf, pier, dolphin, boom, weir, breakwater, bulkhead, jetty, or other structures in any port, roadstead, haven, harbor, canal, navigable river, or other water of the United States, outside established harbor lines, or where no harbor lines have been established, except on plans recommended by the Chief of Engineers and authorized by the Secretary of War; and it shall not be lawful to excavate or fill, or in any manner to alter or modify the course, location, condition, or capacity of, any port, roadstead, haven, harbor, canal, lake, harbor of refuge, or inclosure within the limits of any breakwater, or of the channel of any navigable water of the United States, unless the work has been recommended by the Chief of Engineers and authorized by the Secretary of War prior to beginning the same."

Every person and every corporation which shall be

"*Sec.* 12. That every person and every corpora-

guilty of creating or continuing any such unlawful obstruction in this act mentioned, or who shall violate the provisions of the last four preceding sections of this act, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished by a fine not exceeding five thousand dollars, or by imprisonment (in the case of a natural person) not exceeding one year, or by both such punishments, in the discretion of the court, the creating or continuing of any unlawful obstruction in this act mentioned may be prevented and such obstruction may be caused to be removed by the injunction of any circuit court exercising jurisdiction in any district in which such obstruction may be threatened or may exist; and proper proceedings in equity to this end may be instituted under the direction of the Attorney-General of the United States."

tion that shall violate any of the provisions of sections nine, ten, and eleven of this Act, or any rule or regulation made by the Secretary of War in pursuance of the provisions of the said section fourteen, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished by a fine of not exceeding twenty-five hundred dollars nor less than five hundred dollars, or by imprisonment (in the case of a natural person) not exceeding one year, or by both such punishments, in the discretion of the court. And further, the *removal* of any *structures* or parts of structures erected in violation of the provisions of the said sections may be enforced by the injunction of any circuit court exercising jurisdiction in any district in which such structures may exist, and proper proceedings to this end may be instituted under the direction of the Attorney-General of the United States."

Sections 9, 10 and 12 of the 1899 Act, and certain other sections thereof, were enacted as a result of the following procedure: The Rivers and Harbors Act of June 3, 1896 (Laws of U. S. for Rivers & Harbors, Vol. 1, p. 743; U. S. Statutes at Large, Vol. 29, p. 202) directed the Secretary of War

"to cause to be prepared a compilation of all general laws that have been enacted from time to time by Congress for the maintenance, protection, and preservation of the navigable waters of the United States which are now in force, and to submit the same to Congress to-

gether with such recommendation as to revision, emendation, or enlargement of the said laws as, in his judgment, will be advantageous to the public interest."

Accordingly, the Secretary of War, on February 13, 1897, submitted to Congress a letter of the Chief of Engineers dated February 10, 1897, which letter was accompanied by the compilation aforesaid, and a draft of Sections 9, 10 and 12 of the 1899 Act mentioned. The letters of the Secretary of War and Chief of Engineers are contained in House Document No. 293, 54th Congress, 2d Session. The draft as submitted by the Chief of Engineers and the Secretary of War, and as contained in the House Document mentioned, contains therein sections numbered 1, 2 and 4, which are identical with Sections 9, 10 and 12 of the March 3, 1899 Act.

We will now discuss the legal obstacles to this Court's sustaining the decree of the District Court, enjoining appellant from abstracting from Lake Michigan in excess of 4,167 cubic seconds feet of water.

I.

THE DIVERSION BY APPELLANT TO THE AMOUNT PROVIDED FOR UNDER THE ACT OF ILLINOIS OF MAY 29, 1889, UNDER WHICH APPELLANT WAS ORGANIZED AND EXISTS, HAS BEEN "AFFIRMATIVELY AUTHORIZED BY LAW" (RIVERS AND HARBORS ACT OF SEPTEMBER 19, 1890) LIKEWISE, IT HAS BEEN "AFFIRMATIVELY AUTHORIZED BY CONGRESS" (RIVERS AND HARBORS ACT OF MARCH 3, 1899).

(a) Appellant was organized under an Act of the General Assembly of Illinois, passed in the exercise of the state's police power. This Act fixed appellant's powers and duties and specified the required diversion of water from Lake Michigan.

Appellant, as has heretofore been pointed out in the statement, (p. 30), was organized under the Act of the General Assembly of Illinois passed May 29, 1889, in force July 1, 1889. There were three purposes of this legislation.

1. To provide for the organization of appellant.

2. To construct a canal with necessary adjuncts and appurtenances across the Continental Divide, from Chicago to Joliet, the minimum capacity of which should be not less than 10,000 cubic feet of water per second, which water, together with the drainage and sewage from Chicago and its environs, appellant was required to divert from Lake Michigan to the DesPlaines River for the purpose of protecting from pollution Chicago's only water supply.

3. To provide, by this Sanitary & Ship Canal and attendant diversion, from Lake Michigan to its southern terminus and on the Illinois River, a deep waterway, to take care of the demands of navigation.

Appellant was organized pursuant to its Organic Act by vote of the people. The Board of Trustees was elected. This Board immediately entered upon its duties to provide an outlet for the sewage and drainage of Chicago, as prescribed by the Organic Act. An ordinance was passed by the Board for the issue and sale of bonds for the purpose of raising money to carry out its objects. A taxpayer filed a bill to enjoin the operation of this ordinance on the ground that the Act under which appellant was organized, was repugnant to the constitution of Illinois. This suit was decided on appeal by the Supreme Court of the state on June 12, 1890.

Wilson v. *Board of Trustees*, 133 Ill. 443.

In another case,

People v. *Nelson*, 133 Ill. 565,

decided the same day, the Court again held the Act constitutional. The Court said (p. 580):

> "Of course it must be conceded both as a historical fact and as a fact abundantly shown by the terms of the act itself, that this scheme was formulated mainly, if not exclusively, with reference to the sanitary condition and needs of the City of Chicago and its environs, and we cannot give proper construction of the act without taking into account the peculiar situation of the territory which the proposed Sanitary District of Chicago is intended to embrace. * * * The object of the system of drainage proposed by said act, is to prevent the drainage and sewage of the City of Chicago and its environs being carried into Lake Michigan, thereby contaminating the waters of the lake. This result is to be reached by cutting a channel which will give an outlet for the drainage and sewage of the city in the direction of the Desplaines and Illinois Rivers, and which will also cause a large flow of water from the lake through the proposed artificial channel into those rivers, for the purpose of diluting the sewage and rendering it innocuous to the people living along the course of those streams."

In speaking of the amount of diversion, the Court said (p. 582):

> "The act contemplated a minimum flow of 300,000 and a maximum flow of 600,000 cubic feet of water per minute

through the proposed artificial channel into said rivers." (Desplaines and Illinois rivers.)

Further, in speaking of the removal of obstructions in the DesPlaines and Illinois Rivers, it was further said (p. 582):

> "Among these are the dams heretofore constructed by the state for the purpose of improving the navigation of the Illinois River, and the act specifically confers upon the district the power to make such removal."

In speaking of the waterway features of the Act, the Court said (p. 592):

> "The provisions of the act conferring upon the district powers and imposing upon it duties in relation to the waterways beyond the terminus of its own channel, were inserted for this purpose and are therefore a part, and a necessary part, of the general system of drainage for sanitary purposes embraced within the subject expressed in the title."

Again, the Court said (p. 594):

> "Section 24, however, recognizes the obvious fact that the contemplated channel when completed in such a way as to accomplish in a satisfactory manner the purposes for which it is designed, will constitute a waterway capable of being utilized for purposes of navigation, and therefore declares what, in the absence of such declaration, would be the fact, viz., that when so completed it shall be a navigable stream."

In

Pittsburg, Fort Wayne & Chicago Railway Company v. *The Santiary District of Chicago,* 218 Ill. 286,

a petition to condemn the lands of the railroad company along the south branch of the Chicago River, was filed (shortly after June 19, 1901) (p. 287):

> "to enable it (appellant) to deepen, widen and improve said river from Lake to Robey Streets and thereby increase the flow of water from Lake Michigan through said river into its main artificial channel, which connects with the said south branch at Robey Street and extends to Lockport—Illinois—increasing the said current in said

river to a greater velocity than that provided for by the Secretary of War in the permit issued to said Sanitary District by him permitting it to divert a portion of the waters of Lake Michigan to the said south branch into its main channel, * * * in order that it might comply with the statute of the State of Illinois and obtain a minimum flow through its channel of 300,000 cubic feet of water per minute and such additional quantities of water as from time to time the population of the Sanitary District might require."

The question was raised as to whether the Sanitary District had the power under its act to condemn this railroad property. The Court said (p. 295):

"The statute requires the Sanitary District to provide a minimum flow of 300,000 cubic feet of water per minute and the velocity of the flow was limited to 3 miles per hour, which was afterwards limited by the Secretary of War to 1¼ miles per hour. No water could be obtained except from Lake Michigan through the river with its narrow, winding and obstructed channel, which was lined with docks, railroads and other improvements, and when the statute authorized the Sanitary District to enter upon, use, widen, deepen and improve the Chicago River, * * * it manifestly intended to and did confer upon said Sanitary District the power to condemn any and all property * * * which was necessary for it to possess and control in order that it might successfully widen, deepen and improve said river, which clearly includes the property of appellants."

The acquisition of the property mentioned in the foregoing case, was required in order to carry out the comprehensive improvement of the Chicago River and its branches, by widening and deepening their channels, to provide for the withdrawal of at least 10,000 cubic seconds feet of water through these channels and the Sanitary & Ship Canal. The Secretary of War had by the two permits of July 11, 1900, authorized this "work" or improvement. (Appellant's Narrative, p. 92.)

So far as the authority of Illinois for the diversion was required it was full and complete. The works with their at-

tendant diversion were thus "authorized by law" under the Rivers and Harbors Act of September 19, 1890.

United States v. *Bellingham Bay Boom Co.*, 176 U. S. 211.

(b) The diversion of water from Lake Michigan to operate the Sanitary & Ship Canal of appellant has been authorized by the Act of Congress of March 2, 1827. (Appellant's Narrative, p. 412.)

The Act in question was entitled

> "An Act to Grant a Quantity of Land to the State of Illinois for the Purpose of Aiding in Opening a Canal to Connect the Waters of the Illinois River with those of Lake Michigan".

The first section of said Act provided

> "that there be, and hereby is, granted to the State of Illinois, for the purpose of aiding the State in opening a canal to *unite the waters of the Illinois River with those of Lake Michigan*, a quantity of land. * * * That the said canal, when completed, shall be, and forever remain, a public highway."

In order that the force and effect of this Act, and the intention of Congress thereunder, may be best understood, we will call attention to some of the attendant facts which undoubtedly were the cause of this legislation. At this time, and prior, the country was sparsely settled. The possibility of its development was generally recognized. Statesmen appreciated the value of water routes extending throughout the country then practically the only means of transportation. The necessity of developing these water routes was recognized as furnishing the only means by which the commercial activity of the country could be extended and the different parts bound together and made a homogeneous whole. It was necessary that the interests of the people located in different localities be made dependent one upon the other, by trade and travel. The Act of Cession of the Northwest Territory, by Virginia, passed in 1783, made it a condition of the grant that

it should be divided into states, not less than one hundred square miles nor more than one hundred and fifty square miles in extent. Under this plan, it was proposed to divide the Northwest Territory into fourteen or sixteen states. James Monroe shortly thereafter visited the country and reached the conclusion that there should be fewer states, and thereupon reported to Congress, and his report was adopted on July 7, 1786. The report, in referring to the division, stated (Appellant's Narrative, p. 404):

> "Some of the new states will be deprived of the advantages of navigation, some will be improperly intersected by lakes, rivers and mountains * * * Due attention ought to be paid to natural boundaries."

Thereupon the Ordinance of 1787 was passed, Article V thereof providing that the Northwest Territory should be divided into *not less than three states nor more than five states.* The division between the Western and Middle and Eastern states was provided to be substantially the present boundary between Illinois and Indiana and that between Ohio and Indiana. The Northern boundary of the three states was Canada. It was further provided that North of a line drawn through the Southern end of Lake Michigan that territory might be made into one or two states. The Illinois Enabling Act of Congress of 1818 was amended, at the time of its passage to include in Illinois the port of Chicago and a considerable portion of the shore of Lake Michigan to the present Northern boundary of Illinois. When this Enabling Act was amended, Mr. Pope, territorial delegate from Illinois stated, in proposing the amendment:

> "The object of this amendment was to gain for the proposed state a coast on Lake Michigan. This would afford additional security to the perpetuity of the Union inasmuch as the state would thereby be connected with the states of Indiana, Ohio, Pennsylvania and New York through the lakes. *The facility of opening a canal between Lake Michigan and the Illinois River * * * is acknowledged by everyone who has visited the place. Giving to the proposed state the port of Chicago, embraced in the proposed limits, will draw its attention to*

> *the opening of communication between the Illinois River and the improvement of that harbor.*" (Appellant's Narrative, p. 405.)

The water route from Lake Michigan through the Chicago River, its South branch and West fork, to the DesPlaines and Illinois Rivers had been used from time immemorial by explorers, adventurers and fur traders. In 1819, official reports were made by engineers and officers of the United States as to this route, and the feasibility of improving and enlarging it for navigation (Appellant's Narrative, p. 406.)

On March 30, 1822, Congress passed an Act entitled substantially the same as the March 2, 1827 Act, providing

> "That the State of Illinois be, and is hereby, authorized to survey and mark through the public lands of the United States the route of the canal *connecting the Illinois River with the Southern bend of Lake Michigan, and ninety feet of land on each side of the canal shall be forever reserved from any sale to be made by the United States.*" (Appellant's Narrative, p. 410.)

The failure of Illinois to act upon the grant within the time required caused it to be of no further force or effect.

Thereupon the General Assembly of Illinois memoralized Congress in 1826, calling attention to the importance of constructing a canal to unite the waters of Lake Michigan with the Illinois River, which

> "will form an important addition to the great connecting links in the chain of internal navigation, which will effectually secure the indissoluble federal union of this great and powerful republic." (Appellant's Narrative, p. 411.)

It was obviously important to the statesmen of that day that there should be an outlet to the sea from Lake Michigan. Undoubtedly the position of Great Britain, denying to the people of the United States the free navigation of the St. Lawrence River, also had an important bearing upon the purpose of Congress in providing for a canal and for the use of the waters of Lake Michigan to operate it (Appellant's Nar-

rative, p. 408). Great Britain maintained this position as to the St. Lawrence until the treaty of 1854, which granted merely the privilege to the people of the United States to pass along the St. Lawrence.

On January 9, 1836, the General Assembly of Illinois passed the Act under which the Illinois and Michigan Canal was constructed. Section 16 of this Act provided for the width of the canal and also that ninety feet on each side should be reserved for its future enlargement. This followed exactly the expressed will of Congress as to such reservation. The canal, as provided by said Section 16, was

> "to be supplied with water from Lake Michigan and such other sources as the Canal Commissioners may think proper." (Appellant's Narrative, p. 412.)

The Act of March 2, 1827, is still in force, and whatever rights were granted to, and whatever obligations were imposed upon, the State of Illinois under that Act, now exist. The Act authorized the construction of a canal across and through the public domain and granted lands to the state to aid in constructing it

> "to unite the waters of the Illinois River with those of Lake Michigan."

Lake Michigan was the highest point. It must necessarily have been the start of the canal. The only water supply for the operation of the canal was Lake Michigan. Illinois was empowered to construct a canal of any size that it considered reasonable to accomplish the objects desired,—in other words, to build such a canal as it considered would suit the demands of commerce. It was authorized not only then to construct the canal, but it was empowered further to improve, enlarge or supplant the canal and maintain one, at all times, in such manner as it considered the interests of navigation required. The State was empowered then to divert such quantity of water as in its judgment was necessary

---

NOTE: The Sanitary and Ship Canal is approximately the width of the old Illinois and Michigan Canal plus the ninety feet on each side reserved for enlargement.

to operate the canal, and also to divert any other or greater quantity necessary to operate an enlarged canal to accomplish the purpose of the Act of Congress of March 2, 1827. There was no limitation on the amount of the diversion from Lake Michigan. Complete authority—all the authority that was required for this purpose—the State had under the Act of March 2, 1827.

In

Missouri v. *Illinois*, 200 U. S. 496,

Missouri instituted a suit to enjoin the Sanitary District from diverting water from Lake Michigan and turning its sewage and drainage into the DesPlaines and Illinois Rivers, claiming that it polluted the Mississippi River and the water supply of St. Louis. This Court said (p. 519):

> "In the case at bar, whether Congress could act or not, there is no suggestion that it has forbidden the action of Illinois."

The Court further said (p. 526):

> "Some stress was laid on the proposition that Chicago is not on the natural watershed of the Mississippi, because of a rise of a few feet between the Desplaines and the Chicago rivers. We perceive no reason for distinction on this ground. The natural features relied upon are of the smallest. And if, under any circumstances, they could affect the case, it is enough to say that Illinois brought Chicago into the Mississippi watershed in pursuance, not only of its own statutes, but also of the acts of Congress of March 30, 1822 (chap. 14, 3 Stat. at L. 659), and March 2, 1827 (chap. 51, 4 Stat. at L. 234), the validity of which is not disputed."

The effect of the Act of Congress of March 2, 1827, was interpreted by the Supreme Court of Illinois in

Mortell v. *Clark*, 272 Ill. 201.

In that case a taxpayer sought to enjoin the action of appellant in constructing the Calumet Sag Channel, an adjunct of the Sanitary and Ship Canal, extending from the Little Calumet River to the main canal at Sag, Illinois, and designed to reverse the flow of the Calumet River and furnish an out-

let for the sewage and drainage of the territory South of 87th Street in Chicago. It was claimed that there was no authority from the Federal Government to construct this canal. The Court said (p. 213):

> "Said act of 1903 permits the crossing of the Illinois and Michigan canal near Sag bridge and provides for the abandoning of certain portions of said canal. Counsel for appellant argue that this is in violation of the Federal grant of 1822, under which the Illinois and Michigan canal was constructed, which provides, among other things: 'If said ground shall ever cease to be occupied by and used for a canal suitable for navigation, the reservation and grant hereby made shall be void and of none effect.' (Hurd's Stat. 1913, p. LXXXVIII.) The canal was built under the authority of the act of Congress of March 2, 1827, the act of 1822 having been mutually abandoned by the State and Federal governments. (*Werling* v. *Ingersoll*, 181 U. S. 131; *Wells* v. *Wells*, 262 Ill. 320.) This Federal act did not provide just where the canal should enter Lake Michigan, simply stating that the land was granted for the purpose of opening 'a canal to unite the waters of the Illinois river with those of Lake Michigan,' etc. (Hurd's Stat. 1913, p. LXXXVIII.) *The sanitary district's main channel as now constructed practically complies with this act and furnishes a canal more suitable for navigation than the Illinois and Michigan canal. Furthermore, the Sag channel or cut-off is required to be navigable* by said act of 1903, and the proof shows that the Calumet river is navigable to the point where it is intersected by the Sag channel. *This cut-off would therefore also practically comply with both of said Federal acts as to furnishing part of the canal for connection of the Illinois river with Lake Michigan.*"

The Illinois-Michigan Canal was placed in operation in 1848. No sooner had it been completed than the necessity of its enlargement was recognized. The General Assembly of Illinois in 1861 provided for a survey to be made for the enlargement and improvement of this water course and the diversion of waters from Lake Michigan

> "to secure a free-flowing, ample and never failing supply of water sufficient for navigation of the Illinois River at all season and times." (Appellant's Narrative, p. 415.)

President Lincoln in his message to Congress of December 1, 1862 (Vol. 5, Messages and Papers of the Presidents, p. 3334) stated:

> "The military and commercial importance of enlarging the Illinois-Michigan Canal and improving the Illinois River is presented in the report of Colonel Webster to the Secretary of War and now transmitted to Congress. I respectfully ask attention to it."

Congress provided for a survey for the improvement of this water course on June 23, 1866, and the next year, February 12, 1867, General Wilson made recommendations as to its improvement. The summit level of the canal was cut down at the expense of the City of Chicago in 1871 to provide for the taking of a greater amount of water from Lake Michigan to operate the canal. Pursuant to Acts of Congress, in 1875, 1880, 1882 and 1887, further reports were made as to the enlargement of the waterway by constructing a deep waterway with a large diversion from Lake Michigan to the DesPlaines and Illinois Rivers. (Statement, p. 19.)

The day before the Act under which appellant was organized was passed, May 28, 1889, the General Assembly of Illinois passed a resolution stating its waterway policy—namely

> "That it is the policy of the State of Illinois to procure the construction of a waterway of the greatest practical depth and usefulness for navigation from Lake Michigan via the Desplaines and Illinois Rivers to the Mississippi River, and to encourage the construction of feeders therto of like proportions and usefulness." (Appellant's Narrative, p. 448.)

Only two years before appellant's Organic Act was passed, Major Handbury made a report under the Rivers and Harbors Act of August 5, 1886, which report was published in the Chief of Engineers' report for the year 1887, in which he stated (Appellant's Narrative, p. 447):

> *"The United States and the State of Illinois have long been committed to the project of opening a water communication between the Mississippi River and the northern lakes of capacity sufficient for the wants of commerce*

> *and for the exigencies of our national defense, should these ever arise.* * * * Pushing this improvement through to the Lake, the connecting link will be formed which will join the northern lakes with the vast network of navigable rivers whose waters flows into the Gulf of Mexico *on a scale to a certain degree commensurate with the importance of the commerce and will be affected by it.*"

The State of Illinois, in providing for the construction of the Sanitary & Ship Canal of the size capable of diverting at least 10,000 cubic feet of water from Lake Michigan for sanitary and navigation purposes, proceeded with deliberation and care. It's acts, in this respect, were consonant with the interpretation of the March 2, 1827 Act by Congress and by appellee's officers extending over half a century.

The basic principle of the plan, as stated, was the reversal of the Chicago River at all times so that it would not ever flow into Lake Michigan, carrying with it its sewage and drainage pollution. The maximum flood run-off of the Chicago River drainage area or flow of the Chicago River being 10,000 seconds feet, it is obvious that the capacity of the Sanitary & Ship Canal could not be less. To provide a "never-failing" supply of water for navigation of the Illinois River at all times, it was likewise necessary to have a volume of water from Lake Michigan for navigation purposes of that amount. (Statement, p. 18.) The improvement of navigation by the construction of the Sanitary & Ship Canal, and its diversion of water, required the amount necessary to protect the Chicago water supply.

Major Marshall, the U. S. Engineer at Chicago, on May 1, 1889, pursuant to the Rivers and Harbors Act of August 11, 1888, made a report which is published in the Chief Engineers' Reports, concerning the improvement of this waterway. This report was made while the bill to authorize the construction of these works was pending in the General Assembly of Illinois. He reported the purpose of the diversion in the same

way, as appears from the following statement of his report (Rec. Vol. IV, 2172):

> "Whenever the large channel contemplated by the City of Chicago for drainage is actually determined upon, *in view of the fact that a channel for navigation and the channel for drainage across the Chicago divide must necessarily occupy the same field, it is evident that to avoid duplication of expense, the channel, at least in the expensive rock section, should be constructed best to meet the requirements of navigation in slope, velocity of current, and dimensions of section, while at the same time of sufficient flowing capacity to carry off the drainage of the Sanitary District.*"

Illinois fixed the amount of the diversion by appellant's organic act which action was also pursuant to the Act of Congress of March 2, 1827. The diversion has, thus, not only been "affirmatively authorized by law," but also "affirmatively authorized by Congress," complying with both the Rivers and Harbors Acts of September 19, 1890, and of March 3, 1899.

(c) Appellee, through its engineer officers and the Secretary of War, observed the action of the State of Illinois and of appellant pursuant to its authority in planning and constructing the diversion works. The Secretary of War consented to the work necessary to accomplish the diversion and authorized the opening of the main channel of the district. The Secretary of War construed the Congressional act of March 2, 1827, and the laws of Illinois, as affirmatively authorizing the diversion.

The Chief of Engineers, immediately upon the passage of the appellant's Organic Act of May 29, 1889, reported to Congress the fact of its passage, and the report contained a copy of the Act. It contained also a copy of the report of the Drainage and Water Supply Commission of January 30, 1887. It is published in the Chief of Engineers Reports for

1890 (Appellant's Narrative, p. 451). In this report Major Marshall stated (Appellant's Narrative, p. 453):

> "This route has invited attention as a practicable locus for a waterway between the Great Lakes and Mississippi River for many years, and its advantages, have been so often reported to Congress, that anything herein said would be mere repetition."

Each year the Chief of Engineer's reports contained statements of the progress of the work on the construction of the Sanitary & Ship Canal.

August 16, 1895, the Board of Engineers, of which General Poe was Chairman, reported to the Secretary of War as to the effect of the diversion of 10,000 cubic seconds feet of water from Lake Michigan upon the surface elevations of the Great Lakes. (Appellant's Narrative, p. 464.)

Even Congress took cognizance of the report of Major Marshall of January 27, 1897, by specifically mentioning the report in the Rivers and Harbors Act of March 3, 1899. (Statement, p. 48.) Major Marshall's report was made pursuant to a prior act of Congress. In this report thus specifically mentioned by said Rivers and Harbors Act, it is stated that the Sanitary & Ship Canal had approximately been completed, with a depth of from 18 to 22 feet, and with a width in the rock section of 160 feet to more than 200 feet in earth

> *"which may be made available as part of any enlarged waterway over the route in question."*

It is further stated

> "To comply with the law of the State of Illinois under which this drainage canal is constructed—it has been constructed of a capacity to discharge 600,000 cubic feet per minute through the section excavated in rock, and 300,000 cubic feet per minute throughout the earth section—the law requires a discharge of 20,000 cubic feet per minute for each 100,000 inhabitants of the Drainage District, which at present requires more than 300,000 cubic feet, and in a few years will require the full 600,000 cubic feet discharge through the canal." (Appellant's Narrative, p. 487.)

Early in the construction work, April 21, 1891, the Board of Trustees of appellant laid out a project to enter upon, use, widen, deepen and improve the Chicago River and the South Branch from Lake Michigan to the West Fork

> *"so as to make the same a proper and sufficient supply channel for the main channel heretofore surveyed from the Chicago River to Joliet."* (Appellant's Narrative, p. 454.)

A copy of this ordinance was sent to the Secretary of War.

The Sanitary & Ship Canal was constructed and excavated entirely in lands within the State of Illinois and not upon any lands or in any navigable waters of the United States. However, to accomplish the taking of the water from Lake Michigan through the Chicago River and its branches to the Sanitary & Ship Canal, it was necessary to greatly deepen and widen their channels. Otherwise the water could not be drawn through in the quantities required by appellant's diversion works. This was the occasion for the ordinance of April 21, 1891, above mentioned.

June 16, 1896, to carry out this object, the Sanitary District made request to the Secretary of War for a permit to improve the Chicago River and certain of its branches in certain particulars. In this request, appellant stated:

> **"The work of the Sanitary District of Chicago has progressed so far that it is now necessary for us to enter upon that which must be done in the Chicago River to make available the artificial channel which we have under construction from Robey Street, Chicago, to Lockport, in Will County, 28 miles distant. Our connection with Lake Michigan must be through the Chicago River, the West Fork of the South Branch, of which we make a junction at Robey Street. (Appellant's Narrative, p. 38.)**

The Secretary of War, July 3, 1896, granted the request for

> **"permission to make certain changes in the capacity of the channel of the Chicago River * * * at points indicated on the map accompanying the application"**

on condition—

> "(1) That while the general plan is approved, the Sanitary District of Chicago must furnish plans in triplicate on an enlarged scale, showing each proposed new bridge, each by-pass and each new dock or wharf proposed to be built in order that the Secretary of War may act intelligently in each case.
>
> (2) That this authority shall not be interpreted as approval of the plans of the Sanitary District of Chicago to introduce a current into Chicago River. This latter proposition must be hereafter submitted for consideration." (Appellant's Narrative, p. 474.)

Was there anything in this transaction that indicated that the Secretary of War did not consider appellant to be authorized by law to divert the water provided by appellant's Organic Act, 20,000 cubic feet per minute for each 100,000 of the population?

Following this permit, there were many others issued on request of the Sanitary District, consenting to the work of deepening and widening the Chicago River, its South Branch and West Fork, and prior to the opening of the canal on January 17, 1900. (Appellant's Narrative, p. 475.)

The work of the improvement of the Chicago River prior to the opening of the Sanitary & Ship Canal, looked only to so enlarging the cross section of its channels as to allow the withdrawal through it of the water required at that time, the population of appellant being approximately a million and a half. So when the Sanitary & Ship Canal was constructed, appellant requested a permit for the opening of same (May 8, 1899 permit). Among other recitals, it was stated that *permission has heretofore been granted to make certain improvements in the Chicago River for the purpose of correcting and regulating the cross section of the river so as to secure a flowage capacity of* 300,000 *cubic feet per minute, with a velocity of* 1¼ *miles an hour,*

> "it being intended to connect the said original channel with the West Fork of the South Branch of the Chicago River at Robey Street, in the said City of Chicago." (Appellant's Narrative, p. 22.)

Then permission is granted to open the channel constructed and cause the water of the Chicago River to flow into the same, subject to the following conditions only:

(1) Congressional action.

(2) Current in the Chicago River.

(3) Sanitary District to be responsible for damage to property.

Here there was affirmative evidence of the Secretary of War's understanding that the diversion was authorized by law, and it was his only duty to approve the plans for the work of securing a proper channel from Lake Michigan through these rivers to the Sanitary and Ship Canal, by which the necessary water could be diverted for sanitary and navigation purposes.

The work of improving the channels of the Chicago River and its branches, authorized by the two permits of July 11, 1900, (Appellant's Narrative, p. 92) was done for the avowed purpose of making those channels of such width and depth that they could properly carry through them 10,000 cubic seconds feet of water from Lake Michigan to the Sanitary and Ship Canal. (Requests for Permits, Appellant's Narrative, pp. 90, 91.) The depth under these permits, as will be recalled, was 26 feet and the width at all points of 200 feet. The work has been done according to these plans so approved at a cost of upwards of $10,000,000.

(d) The Secretary of War, charged with the duty of enforcing the Rivers and Harbors Acts of September 19, 1890, and March 3, 1899, has thus construed a diversion to the capacity of appellant's Sanitary and Ship Canal, to have been "affirmatively authorized by law" and "affirmatively authorized by Congress." These acts of the Secretary of War should have the force of judicial interpretation.

In

Hastings & Dakota Railroad Company v. *Whitney*, 132 U. S. 357, 366,

suit was instituted to recover certain lands which the defendant claimed it owned under a United States patent. A question arose as to the construction of the Soldiers' Homestead Law. This Court said:

> "It is true that the decisions of the Land Department on matters of law are not binding upon this court in any sense, but on questions similar to the one involved in this case, they are entitled to great respect in the hands of any court."

> "In *U. S.* v. *Moore*, 95 U. S. 760, 763, this Court said: 'The construction given to a statute by those charged with the duty of executing it, is always entitled to the most respectful consideration, and ought not to be overruled without cogent reasons. * * * The officers concerned are usually able men and masters of the subject; not infrequently they are the draftsmen of the laws they are afterwards called upon to interpret.'"

See, also,

Shells Executors v. *Fauche*, 138 U. S. 562, 572.
Heath v. *Wallace*, 138 U. S. 573, 582.

The Act of Congress of March 2, 1827, providing for the construction of a canal from Lake Michigan to the Illinois River, thus expressly authorized the State of Illinois to divert such quantity of water as it should deem reasonably necessary for navigation purposes, not only for the operation of the canal, but for the purpose, also, of providing deeper channels at low water times in the Illinois River, so that naviga-

tion thereon would be assured—navigators would feel secure in having the proper depths. At no time during the history of the construction and installation of the works of appellant, did any officer or agent of appellee suggest that this authority did not exist. It was recognized from the beginning. When the State of Illinois provided for the construction of appellant's works to divert at least 10,000 cubic seconds feet of water through the Sanitary & Ship Canal, the officers of the United States carefully observed the activities of appellant in making plans for these works and in doing the construction work. These facts were reported to Congress. When it became necessary to excavate or fill in the channels of the Chicago River and its branches, there was no hesitancy indicated in granting the permission in order that appellant's Sanitary & Ship Canal when completed might be made effective for the purpose of diverting the required water from Lake Michigan for sanitary and navigation purposes. When the canal was ready to be opened, like consent was given without limitation, except concerning current in the Chicago River unreasonably obstructive to navigation thereon. The future action of Congress was, of course, made, also, a condition which would exist in any event without its being named as a condition in the permit. The Secretary of War thus authorized the work of reversing the current and flow of the Chicago River which would be accomplished by opening the Sanitary & Ship Canal.

When the canal was opened, the channels of the Chicago River and its branches had been improved to provide for the withdrawal then necessary for the then population of appellant, approximately 1½ millions of people. To provide for the increase in population, it was necessary to comprehensively enlarge and improve these channels in order to take the additional volume of water from Lake Michigan through them to appellant's Sanitary & Ship Canal.

Appellant's requests for permits to do this work, were made on April 26 and June 7, 1900. Almost immediately thereafter the Secretary of War consented to the doing of the work,

approved the plans for the work, (July 11, 1900), and the work was done. *"The work has been recommended by the Chief of Engineers and authorized by the Secretary of War prior to beginning the same."* (Sec. 10, Rivers and Harbors Act of March 3, 1899, *ante*, p. 106.)

The Secretary of War, in authorizing the opening of the Sanitary and Ship Canal, and in authorizing the excavation in the channels of the Chicago River and its branches to provide for the diversion through them to the Sanitary and Ship Canal of the amount of water required by appellant, must be deemed to have construed and interpreted the March 2, 1827 Act and the Illinois Act of May 29, 1889, as authorizing appellant's diversion.

II.

THE PERMITS OF THE SECRETARY OF WAR OF JULY 11, 1900, AUTHORIZING THE WORK OF DEEPENING AND WIDENING THE CHANNELS OF THE CHICAGO RIVER TO PROVIDE FOR THE DIVERSION OR ABSTRACTION FROM LAKE MICHIGAN THROUGH THEM OF THE AMOUNT OF WATER REQUIRED BY THE STATE LAW ACCORDING TO THE POPULATION OF APPELLANT, CONSTITUTED ALL THE AUTHORITY REQUIRED BY APPELLANT FROM APPELLEE, TO DIVERT SAID WATERS.

We will consider, now, the force and effect of Section 10 of the Rivers and Harbors Act of March 3, 1899, without regard to the Act of March 2, 1827, providing for the construction of the Illinois and Michigan Canal across the Chicago or Continental Divide.

In this connection it must be remembered that the Act of May 29, 1889, of the Illinois General Assembly specifically directs and empowers appellant to build and operate its diversion works to abstract from Lake Michigan 20,000 cubic feet of water per minute for each 100,000 population of appellant. The population of appellant at the time the decree was entered herein, exceeded three million inhabitants, thus requiring 600,000 cubic feet of water per minute, or 10,000 cubic feet per second. This authority, of course, is fundamental, and is the foundation of appellant's acts in this respect. Was there any further authority required than that the work should be

> "recommended by the Chief of Engineers and authorized by the Secretary of War prior to the beginning of same"? (Sec. 10, Rivers and Harbors Act, March 3, 1899.)

Excavating and filling in the channels of the Chicago River and its branches, was the only work appellant was required to do in navigable waters of the United States to accomplish

and bring about the diversion. The reversal of the current and flow of the Chicago River and its branches was a necessary result. Anyway, this was consented to specifically by the permit of May 8, 1899, for the opening of the canal. The work of improving these channels was done for the purpose only of providing for the abstraction of the water through them in a proper manner. The only requirement of Congress was that appellant should not excavate or fill or in any manner alter or modify the course, location, condition or capacity of any port, road-stead, haven, harbor, canal, lake, harbor of refuge or enclosure within the limits of any breakwater or of the channel of any navigable water of the United States, unless *the work was recommended by the Chief of Engineers and authorized by the Secretary of War prior to the beginning of same.* The waters were entirely within the confines of the State of Illinois. Appellant having unquestioned state authority, having obtained the authorization of the Secretary of War before commencing *the work* of *excavating,* etc., leading to the alteration or modifying of the course, location, condition or capacity of navigable waters and having done *the work,* the operation of its Sanitary & Ship Canal and other diversion works was and is lawful. That includes, of course, the diversion of water to the amount required by state authority. (10,000 cubic feet per second.)

It has never been suggested that the work of deepening and widening the channels of the Chicago River and its branches under the two permits of July 11, 1900, was not properly performed. While the statement of Secretary of War Stimson of January 8, 1913, in refusing to remove the limitation fixed by the Secretary of War of December 5, 1901, (4,167 cubic seconds feet of water) and to expressly authorize the diversion of 10,000 seconds feet, is perhaps not material here as the statute does not require any findings to be made in such cases, yet there is nothing in such statement as to any failure of appellant to perform the work under said permits. In fact, there is nothing in said statement suggesting any difficulties in navigating the Chicago River and its

branches. (Appellant's Narrative, p. 28.) On the other hand, it is plain that the improvement of the Chicago River made by appellant and all its works have been great aids to navigation. The river was deepened and widened, old bridges were replaced with new bascules, creating vastly deeper, wider and freer channels.

The construction of Sections 9 and 10 of the Rivers and Harbors Act of March 3, 1899, was thoroughly considered in

> *Maine Water Company* v. *Knickerbocker Steam Towage Company*, 99 Maine 473 (decided Feb. 17, 1905).

The Water Company brought suit against the Towage Company for damages sustained to the Water Company's pipe line across the Kennebeck River at Bath, a tidal, navigable river, wholly within the state. The placing of the pipe line in the river was properly authorized by the state. The Secretary of War issued a permit as recommended by the Chief of Engineers, for the work of placing the pipe line in said river. It was claimed by the defendant that the pipe line unlawfully occupied the river, inasmuch as there was no Act of Congress expressly authorizing the plaintiff to place its pipe line in said river. The Court compared Sections 7 and 10 of the Rivers and Harbors Act of September 19, 1890, and Sections 9 and 10 of the Rivers and Harbors Act of March 3, 1899.

Before further discussing the Court's opinion in the Maine case, we will, for the convenience of this Court, set forth in juxtaposition similar clauses of the sections of the two Acts mentioned. Words and clauses not common to both Acts are in italics and, for convenience in future reference, the separate clauses in the 1890 Act will be designated (*a*), (*b*), etc., and those in the 1899 Act (*aa*), (*bb*), etc., respectively.

1890.		1899.	
Sec. 7.	*a*	*Sec.* 10.	*aa*
It shall not be lawful to build any wharf, pier, dol-		It shall not be lawful to build *or commence the*	

phin, boom, *dam*, weir, breakwater, bulkhead, jetty, or structure *of any kind*, outside established harbor-lines, or in any navigable waters of the United States where no harbor-lines are or may be established, *without the permission* of the Secretary of War, in any port, roadstead, haven, harbor, navigable river, or other waters of the United States, *in such manner as shall obstruct or impair navigation.*

Sec. 7. b

It shall not be lawful hereafter to commence the construction of any bridge, *bridge-draw, bridge piers* and abutments, causeway or other works *over or in any port, road, roadstead, haven, harbor, navigable river* or *navigable waters of the United States*, under *any act of the legislative assembly* of *any* state, until the location and plan of such bridge or other works *have been* submitted to and approved by the Secretary of War.

Sec. 7. c

That *this section* shall not * * * be so construed as *to authorize* the construction of any bridge, *draw-bridge, bridge piers and* abutments, *or other* works, *under an act of the legislature of any state*, over or in any *stream*, port,

building of any wharf, pier, dolphin, boom, weir, breakwater, bulkhead, jetty or *other* structures in any port, roadstead, haven, harbor, canal, navigable river or other water of the United States, outside established harbor lines or where no harbor lines have been established, *except on plans recommended by the Chief of Engineers and authorized* by the Secretary of War.

Sec. 9 bb

Such structures (any bridge, *dam*, dike or causeway) *may* be built *under authority* of the *legislature* of *a* state *across* rivers and *other waterways, the navigable portions of which lie wholly within the limits of a single state*, provided the location and plans *thereof are* submitted to and approved *by the Chief of Engineers* and by the Secretary of War, *before construction is commenced.*

Sec. 9. cc

That it shall not be lawful to *construct or commence* the construction of any bridge, dam, dike or causeway over or in any port, roadstead, haven, harbor, *canal, navigable river*, or other navigable water of the United States, until the

roadstead, haven or harbor, or other navigable water not wholly within the limits of such state.

Sec. 7. *d*

It shall not be lawful * * * to excavate or fill, or in any manner to alter or modify the course, location, condition or capacity of the channel of said navigable water of the United States, unless *approved* and authorized by the Secretary of War.

Sec. 7. ***d1.***

That this section shall not apply to any bridge, bridge-draw, bridge piers and abutments, the construction of which has been heretofore duly authorized by law.

Sec. 10. *e*

That the creation of any obstruction, not affirmatively authorized by *law,* to the navigable capacity of any waters, *in respect of which the United States has jurisdiction,* is hereby prohibited.

consent of Congress to the building of such structures shall have been obtained and until the plans for the same shall have been submitted to and approved by the Chief of Engineers and by the Secretary of War.

Sec. 10. *dd*

It shall not be lawful to excavate or fill, or in any manner to alter or modify the course, location, condition or capacity of *any port, roadstead, haven, harbor, canal, lake, harbor of refuge, or inclosure within the limits of any breakwater, or* of the channel of *any* navigable water of the United States, unless *the work has been recommended by the Chief of Engineers* and authorized by the Secretary of War *prior to the beginning of same.*

Sec. 10. *ee*

That the creation of any obstruction, not affirmatively authorized by *Congress,* to the navigable capacity of any *of the* waters of the United States is hereby prohibited.

Sec. 10. *f*

The creating or continuing of any unlawful obstruction in this act mentioned may be prevented and such obstruction may be *caused to be removed* by the injunction of any circuit court exercising jurisdiction in any district in which such *obstruction may be threatened or* may exist; and proper proceedings in equity to this end may be instituted under the direction of the Attorney-General of the United States.

Sec. 12. *ff*

The *removal* of any *structures or parts of structures erected in violation of the provisions of the said sections* may be *enforced* by the injunction of any circuit court exercising jurisdiction in any district in which such *structures* may exist, and proper proceedings to this end may be instituted under the direction of the Attorney-General of the United States.

The Court

(*Maine Water Company* v. *Knickerbocker Steam Towage Company, supra*)

said:

(477) "We cannot help remarking, in passing, that if the defendant's interpretation of the Act of 1899 is the correct one, it leads to a rather surprising condition. It would seem that not a wharf or pier, outside established harbor lines, or where no harbor lines have been established, can now be built, in the navigable waters of the United States, not a dolphin can be anchored for mooring vessels, not a boom can be stretched, nor a weir erected for any purpose, until hereafter authorized by Act of Congress. We think it cannot be assumed that Congress intended any such result unless the Act in question is so expressed as not to admit of any other reasonable interpretation."

The effect of the first sentence of Section 10 of the 1899 Act containing the prohibition against obstructions "not affirmatively authorized by Congress", was particularly important. The Court with reference to this, further said:

(481) "The general prohibition in section 10 is brought with only one substantial change from section 10 of the Act of 1890. The Act of 1890 said 'not affirmatively authorized by law,' which was held in *U. S.* v. *Bellingham*

Bay Boom Co., 176 U. S. 211, to mean not only by a law of Congress, but even by a law of the state in which the river is situated. The Act of 1899 says 'not affirmatively authorized by Congress.' Following this general prohibition, and immediately connected with it, is the remainder of section 7 of the Act of 1890, which relates to wharves and other structures, which would include this pipe line. The only important change is this. The Act of 1890 made unlawful the erection of such structures without the permission of the Secretary of War, in the waters of the United States, outside established harbor lines, or where no harbor lines have been established, in such manner as shall obstruct or impair navigation. The Act of 1899 makes unlawful such erections, except they are built on plans recommended by the Chief of Engineers and authorized by the Secretary of War.

Although in the arrangement of parts, the general prohibition now is found at the beginning of a section which also relates to the specific regulation of the building of wharves and so forth, instead of being in a section by itself as before, we are not persuaded that Congress, by changing its position, intended to change its effect. It is still general as before. And though general in terms before, we think, as we have stated, that structures impliedly authorized by Congress in the preceding sections were not prohibited. And in its new position we think that the general prohibition is likewise qualified by the sentences which follow. It cannot make any substantial difference whether the general prohibition is at the beginning of a section, or at the end, or in a section by itself, if it clearly appears from the language used and from the context, all taken together, that the legislative intention was that the general prohibition was to be regarded as subject to specified qualifications. * * *

* * * the implication seems clear to us that such structures, if built according to plans recommended and authorized as provided in the section, are authorized by Congress—that they are affirmatively authorized,—though the affirmative authority arises by implication,—and that they are lawful without any further action by Congress."

Structures actually named in the 1899 Act are wharf, pier, dolphin, boom, weir, breakwater, bulkhead, jetty, bridge, dam, dike or causeway. The words "or other structures" follow the naming of each class. The bridges rebuilt were the only

structures built by appellant in connection with the deepening and widening of the Chicago River and its branches actually named in the Act. As to such structures, the *plans* were required to be approved by the Chief of Engineers and Secretary of War, and there is no question about these bridge structures. The work of excavating for the widening and deepening, and the work of construction of docks, was covered by the general clause with reference to excavating and filling. (*dd* above p. 135.) As to this (excavating for widening and deepening and thereby to alter and modify, etc.) the *work* (of such deepening and widening) should be

> *"recommended by the Chief of Engineers and authorized by the Secretary of War prior to beginning the same."*

The *work* was so *recommended* and *authorized*. The *work* was done. Thus the altering or modifying the course, location, condition or capacity of the navigable waters of the United States flowing from the work so *recommended* and *authorized*, was lawful. It was immaterial, therefore, *where the navigable waters of the United States were located* that were thus altered and modified as the result of the work so *recommended* and *authorized*.

The altering or modifying of the navigable capacity of the waters, not only of the Chicago River and its branches, but of Lakes Huron, Michigan, Erie, Ontario, their connecting waters, and other navigable waters of the United States, by the diversion of water provided for through appellant's works, was thus authorized and is lawful.

Cummings v. *Chicago*, 188 U. S. 410.

The case of

Hubbard v. *Fort*, 188 Fed. 987 (Circuit Court, opinion by District Judge Rellstab)

is contrary to the opinion of the Supreme Court of Maine in the *Water Company case, supra*. But in that case, the receivers of the Hudson County Water Company who filed the bill to enjoin officers of the State of New Jersey from interfering with the construction of their conduits in the Kill von Koll,

were acting contrary to an Act of New Jersey expressly forbidding the diversion of the waters of New Jersey into the State of New York. The New Jersey Act was held constitutional and valid in

Hudson County Water Company v. *McCarter*, 209 U. S. 349.

In

Southern Pacific Co. v. *Olympian Dredging Co.*, 260 U. S. 205, 210,

this court, in construing the Rivers and Harbors Acts here in question, cited with approval

Maine Water Co. v. *Knickerbocker Steam Towage Co.*, 99 Me. 473, *supra.*

III.

IN ANY EVENT, THE SECRETARY OF WAR HAS AUTHORIZED THE OPENING OF APPELLANT'S SANITARY & SHIP CANAL, ITS OPERATION AND ATTENDANT DIVERSION OF WATER FROM LAKE MICHIGAN BY THE PERMIT OF MAY 8, 1899, EVERY CONDITION OF WHICH HAS BEEN FULFILLED, ASSUMING SUCH CONDITIONS TO BE VALID. THE SECRETARY OF WAR WAS ONLY AUTHORIZED TO GRANT OR REFUSE A PERMIT. HE HAD NO POWER TO REGULATE THE DIVERSION OF WATER AT CHICAGO. THE ATTORNEY GENERAL HAD NO AUTHORITY TO INSTITUTE THE SUIT FOR INJUNCTION.

(a) The effect of the May 8, 1899 permit and attempted limitation thereon.

The Sanitary & Ship Canal was completed during the year 1898 of capacity and size sufficient to take through it the maximum diversion, 14,000 cubic seconds feet of water, when the population of the appellant reached an amount requiring such diversion according to the ratio of dilution fixed by the state law—20,000 cubic feet per minute for each 100,000 of population. The population of the Sanitary District was then only about a million and a half. In order that the amount of water necessary to dilute the sewage of this population might be taken through the channels of the Chicago River and its branches, these channels were partially improved under various permits and authority of the Secretary of War, beginning with July 3, 1896. Notwithstanding the improvements of these channels that had been made, they were still shallow, narrow and tortuous, at some places being only 100 feet wide. With this condition in mind, when the appellant sought to obtain the consent of the Secretary of War to the opening of the Main Channel, the Secretary granted the

permit to open the Sanitary & Ship Canal without any limitation as to the amount of water, except that the current created by the withdrawal should not be unreasonably obstructive to navigation on the Chicago River. This condition was inserted with the view that the channels of the Chicago River and its branches would be later vastly deepened and widened, to provide for the future increase in population and the efficient operation of the canal to divert all of the sewage and drainage of Chicago and its environs. The channel was opened pursuant to this permit on January 17, 1900. Immediately thereafter, appellant made application to the Secretary of War, May 26th and June 7th, 1900, (Appellant's Narrative, pp. 90, 91) to comprehensively improve these rivers. The purpose of such improvement was stated—namely, to provide the means by which the necessary waters of Lake Michigan and the drainage and sewage could be carried to the Sanitary & Ship Canal. The permits of July 11, 1900, for this work were granted in order to carry out this express purpose.

There was no occasion for appellant to thus deepen the Chicago River from 17 to 26 feet and widen it at all points to 200 feet, rebuild bridges at an expense of ten and one-half millions of dollars, if its diversion from Lake Michigan would be limited to 4,167 seconds feet, the amount fixed by the decree of the District Court herein.

With the channels of the Chicago River in this restricted condition, the Secretary of War, on December 5, 1901, directed that the maximum flow through the Chicago River and its South Branch should not exceed 250,000 cubic feet per minute. The orders so limiting the flow, expressly recited the condition of the May 8, 1899 permit as to current in the Chicago River, and that commercial and navigation interests thereon had made objections. (Appellant's Narrative, pp. 23-26.)

The permits of July 11, 1900, for the work of comprehensively deepening and widening the channels, were in existence, had not been revoked, and appellant was proceeding to act under them.

It did do the work thus *authorized* and *recommended*, with the knowledge of the Secretary of War and the Chief of Engineers, without objection. There was no indication or suggestion that the December 5, 1901, order would be sought to be enforced when the work recommended and authorized under the July 11, 1900, permits, was done. In fact, as these river channels were improved, and the population of the district increased, water was diverted in amounts vastly greater than the limitation of 250,000 cubic seconds feet, (the order of December 5, 1901.) (Appellant's Narrative, p. 202.) In addition to the river improvement, appellant otherwise completed its diversion works by constructing the intercepting sewers, North Shore and Sag Channels, with their adjuncts, pumping stations, etc., at a total cost for all works of upwards of $75,000,000.00 and all this was done pursuant to authority of the Secretary of War. (Appellant's Narrative, p. 194.)

After Secretary of War Taft had on March 14, 1907, refused a permit for the diversion of 4,000 cubic feet per second through the Calumet River and the then proposed Calumet Sag Channel, which amount was additional to the diversion of 10,000 cubic feet per second then being provided for through the Chicago River and its branches, the Attorney General of the United States instituted suit, March 23, 1908, to enjoin its construction. (Appellant's Narrative, p. 2.) This suit only involved a diversion by way of the Calumet River and the Calumet Sag Channel *in addition to that through the Chicago River.*

The bill of complaint in the Calumet Sag suit, after reciting the ordinance of the Board of Trustees of appellant providing for the construction of the Calumet Sag Channel, alleges that the construction of said channel,

> "will result in diverting and abstracting from Lake Michigan a large quantity of water, towit, 4,000 cubic feet of water per second, and causing said water to flow through said Calumet Rivers into said Calumet Sag

Channel, through that channel into the Main Channel of said Sanitary District, and thence to the DesPlaines and Mississippi Rivers, and on to the Gulf of Mexico."

Paragraphs 16 and 17 of the answer in said Calumet suit, filed March 23, 1908, describe appellant's Sanitary & Ship Canal and the various other works constructed as adjuncts thereto, for the diversion of 10,000 cubic seconds feet through the channels of the Chicago River and its branches (Appellant's Narrative, p. 12). Yet no legal action or protest was made concerning the actual diversion through the channels of the Chicago River and its branches, of water in excess of the limitation of December 5, 1901, or concerning the diversion that would necessarily take place to the maximum capacity of the Sanitary & Ship Canal as the improvement of the channels of the Chicago River was completed, and as the population of appellant increased.

When the improvement of the channels of the Chicago River was completed, the cause and the reason for the limitation by the order of the Secretary of War of December 5, 1901,—250,000 cubic minutes feet withdrawal from Lake Michigan—was removed. Necessarily it followed that such limitation should then have no further force or effect. It had been so treated, not only by the Secretary of War, but also by the Attorney General in failing, March 23, 1908, or afterwards to take any action thereon.

In the meantime, the International Waterways Commission constituted under authority of the Rivers and Harbors Act of Congress of 1902 (Appellant's Narrative, p. 526) had specially reported finding that there was a tacit general agreement that the diversion of at least 10,000 cubic seconds feet of water would exist at Chicago. The Treaty of 1909 between Great Britain and appellee as to Canadian Boundary Waters, had been made upon the recommendations as to terms made by the International Waterways Commission. Furthermore, the Treaty itself recognized diversions of water from the Great Lakes System for sanitary purposes as paramount and taking precedence over all others.

The Act for the preservation of Niagara Falls had been passed June 29, 1906. Section 1 contained a proviso that under no circumstances should it permit the Secretary of War to limit the diversions for sanitary and domestic purposes except as Congress might in the future direct. (Statement, p. 51.)

Consequently, on February 5, 1912, the channels of the Chicago River and its branches having been deepened and widened pursuant to the permits of July 11, 1900, appellant sought the removal of the limitation of diversion contained in the order of December 5, 1901, and an express authorization for the diversion of at least 10,000 cubic seconds feet by means of all of its diversion works. Appellant undoubtedly assumed, as it had the right to, that the limitation of December 5, 1901, was merely a technical or paper limitation. It desired to have a cloud removed upon its otherwise perfect title. However, May 8, 1913, the Secretary of War refused this application, (Appellant's Narrative, p. 28), and the complaint here in controversy was filed October 6th, 1913.

The action of the executive officers of the Government in seeking to enjoin the operation of appellant's works as required by state law and under all the circumstances, is arbitrary and unreasonable. Equity cannot grant the relief asked and equity would undoubtedly enjoin any overt acts taken by such officers to enforce the said limitation of December 5, 1901.

In

Monongahela Bridge Co. v. *U. S.*, 216 U. S. 177, 195,

it was claimed by the respondent that the action of the Secretary of War was arbitrary and unreasonable in connection with the direction for the alteration of a certain bridge. The Court said:

> "Learned counsel for the defendant suggests some extreme cases, showing how reckless and arbitrary might be the action of executive officers proceeding under an act of Congress, the enforcement of which effects the enjoyment or value of private property. It will be time

enough to deal with such cases as and when they arise. *Suffice it to say that the courts have rarely, if ever, felt themselves so restrained by technical rules that they could not find some remedy, consistent with the law, for acts, whether done by government or by individual persons, that violated natural justice or were hostile to the fundamental principles devised for the protection of the essential rights of property."*

In

Philadelphia Company v. *Stimson*, 223 U. S. 605,

the Court recognized the right of an aggrieved person in equity to enjoin the arbitrary and unreasonable action of the Secretary of War.

In

Kwock Jan Fat v. *Edward White*, as Commissioner of Immigration, 253 U. S. 454, 464,

this Court, in speaking of the power of the Commissioner of Immigration, said:

"It is a power to be administered, not arbitrarily and secretly, but fairly and openly."

The limitation of 4,167 seconds feet, diversion, does not now exist under any condition of the May 8, 1899, permit.

(b) The Attorney General under the Act of March 3, 1899, is only authorized to institute suits in equity for the removal of structures. The District Court was without jurisdiction to entertain this suit or enter the decree.

The suit here is that appellant be enjoined

"from diverting or abstracting any waters from Lake Michigan over and above and in excess of 250,000 cubic feet per minute, as already authorized by said Secretary of War. * * *" (Appellant's Narrative, p. 21.)

Section 12 of the Act of March 3, 1899, authorizing suits in equity, only related to

"the removal of any structures or parts of structures erected in violation of said sections (9-10 and 11)". 'Laws, Improvement Rivers and Harbors, Vol. 2, p. 887, *ff* above p. ....)

Obviously, this suit does not seek the removal of any structure. It was not the purpose of Congress that the Attorney-General should have any other powers than that to cause the removal, by injunction, of structures built contrary to the provisions of the Act. It was not intended that these executive officers could by injunction interfere with the operation of works built under state authority for the protection of public health even though they might have the effect of incidentally obstructing navigation. Congress intended to deal with such cases individually and separately.

That this construction of the effect of Section 12, viz., that it is limited to the institution by the Attorney General of suits only to remove unlawful structures, is borne out by a reference to the provisions of the Act of September 19, 1890, as to such injunction suits. The only clause relating to such suits, is contained in the latter part of Section 10, (Laws Improvement of Rivers and Harbors, Vol. I, p. 583, *f* above p. 136.)

> "the creating or continuing of any unlawful obstruction in this act mentioned, may be prevented and such obstruction may be caused to be removed by the injunction of any Circuit Court exercising jurisdiction in any district in which such obstruction may be threatened or may exist; and proper proceedings in equity to this end may be instituted under the direction of the Attorney General of the United States."

The elimination of the words

> "the creating or continuing of any unlawful obstruction in this act mentioned may be prevented"

contained in the 1890 Act, from the 1899 Act upon a similar subject, and the failure to substitute any words even remotely alike, leads to the inevitable conclusion that it was the intention of Congress that the Attorney General's activity should be confined solely and only to suits to enjoin *the removal* of unlawful *structures.*

Webster's New International Dictionary defines "structure" to be—

> "Something constructed or built, as a building, a dam, a bridge, esp. a building of some size; an edifice."

The clause of the 1899 act refers to "*structures erected*" in violation, etc. Those words cannot possibly cover the excavation in the Chicago River and its branches, such as deepening and widening, which was the work done for the diversion in excess of the 4,167 seconds feet specified by the order of the Secretary of War of December 5, 1901. It cannot refer to appellant's Sanitary and Ship Canal. The words "*structures erected*" certainly would not include a canal built or excavated. These words convey the impression of something placed in a navigable water, which things by their very form or by reason of the very location, would obstruct navigation. The word "structure" is a much narrower term than "obstruction." The word "obstruction" may include a "structure," but the word "structure" certainly cannot cover every "obstruction."

An examination of Sections 9 and 10, furnishes the definition of the word "structures" as used in Section 12. In Section 9, the things mentioned are "bridge, dam, dike or causeway." These are referred to in two places in said section as "such structures," once as "other structure," and once as "the structure."

In Section 10, particular things are also described as "wharf, pier, dolphin, boom, weir, breakwater, bulkhead, jetty." Immediately following the naming of them, are the words "or other structures." Certainly appellant's works for the diversion of this water to the amount required, can not possibly be of the character of the things mentioned as structures. In the first sentence of Section 10, the word "obstruction" is used, and in the last sentence of Section 10 "excavating or filling" is referred to as "work." Had the clause with reference to the Attorney General's instituting suit for injunction in the 1890 Act, been included in the 1899 Act, the Attorney General could have proceeded with reference to obstructions to enjoin their creation or continuance, and also to enjoin the beginning of the work of excavating or filling, or the continuance of the enjoyment of the benefits derived from excavating or filling contrary to the provisions of the Act.

It is important also to consider that in the first part of Section 12, any violations of Sections 9 and 10 "shall be punished by fine or by imprisonment." That portion of Section 12 is as follows:

> "That every person and every corporation that shall violate any of the provisions of sections nine, ten and eleven of this Act, or any rule or regulation made by the Secretary of War in pursuance of the provisions of the said section fourteen, shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished by a fine not exceeding twenty-five hundred dollars nor less than five hundred dollars, or by imprisonment (in the case of a natural person) not exceeding one year, or by both such punishments, in the discretion of the court." (Above p. 109.)

It is plain that the above quoted provision covers the doing of anything contrary to the provisions of Sections 9 and 10, excavating or filling or the creating of an obstruction or the constructing or commencing the construction of any of the *structures* mentioned. It must be presumed that Congress believed that the exaction of the penalty and imprisonment was a sufficient remedy to prevent the creation of obstructions or the excavating or filling contrary to the provisions of the Act. It may be further presumed that Congress did not intend to give to the Attorney General, or any other officer of the United States, the broad power by injunction to prevent the doing of the things by a state or municipality which would only indirectly obstruct navigation; that is, where it was an incidental result of the state's or municipality's action, such as exists in this case. If the power were granted the courts would perhaps feel themselves compelled to enforce it, notwithstanding the dire results that might follow. Thus, by the mere fiat of an executive officer, could the whole course and plan of a state for the protection of the health of its people, be set at naught. The executive officer could thus prevent the carrying out of a most important waterway policy of the state, affecting not only the people of the state, but the people of the entire nation.

In

Ogden City v. *Boreman*, 20 Utah 98, 57 Pac. 843,

the question arose as to whether the City of Utah by ordinance could provide for a license fee to be paid for practicing law in Ogden. It was held that the Statutes of Utah did not empower cities to make such requirement. The laws of Utah as codified in 1888, expressly provided for the licensing of lawyers. There was also a general clause in the 1888 laws authorizing cities to license all trades and businesses. When the laws were re-codified in 1898, the provision with reference to lawyers was not included. It was argued that the general clause covered and embraced the right to license lawyers. The court cited

Endlich on Interpretation of Statutes, Sec. 51.

Sutherland Statutory Construction, Sec. 140.

and held that the City of Ogden had no power to impose a license fee on lawyers. The court said:

> (142) "In Suth. St. Const. Sec. 140, it is said: 'An affimative enactment of a new rule implies a negative of whatever is not included or is different; and if, by the language used, a thing is limited to be done in a particular form or manner, it includes a negative that it shall not be done otherwise. An intention will not be ascribed to the law making power to establish conflicting and hostile systems upon the same subject, or to leave in force provisions of law by which the later will of the legislature may be thwarted and overthrown.' By repealing the clause providing for licensing and taxing lawyers, and enacting the general clause referred to, leaving lawyers and the professions generally out of such re-enactment, impels the conclusion that the legislature intended to deprive the cities of the power to impose a license fee or tax upon lawyers that they had formerly possessed. There must have been an object and purpose in this deliberate repeal in one section and omitting to insert its provision in the act as reenacted, having special reference to licensing and taxing in cities."

The Attorney General and the United States District Attorney who instituted this suit, cannot rely upon the general power to

> "prosecute * * * all civil actions in which the United States are concerned."

The statute with reference to the control of navigable waters by the United States, provides a remedy in certain instances. It necessarily follows that the remedies in instances not named are denied. This is particularly convincing when authority as to certain situations, such as filing a bill to enjoin the creation or continuance of an obstruction, is eliminated from the 1899 Act.

The case of

U. S. v. *Rio Grande Dam & Irrigation Company*, 174 U. S. 690,

is not an authority in support of the Attorney General's power to enjoin the operation of an obstruction under the March 3, 1899, Act. In that case, the bill was filed under the Act of September 19, 1890, which expressly authorized such injunctive relief. Furthermore, the authority of the Rio Grande Dam & Irrigation Company arose by virtue of the Act of the Territory of New Mexico. There was no reserved power of the state exercised as there is here.

The injunctive relief is not available for the United States in the event of the failure of a person, firm or corporation owning a bridge to alter it, as directed by the Secretary of War under Section 18 of the Rivers and Harbors Act of March 3, 1899. The only remedy is the enforcement of the penalty expressly provided by said section.

The Attorney General not being authorized to institute a suit for injunction in the instance described in this proceeding, the District Court was, therefore, without jurisdiction. It could not enter the decree enjoining the continuance of the acts of appellant, for there is no statute providing for either the institution of the suit or its entertainment by the Court.

(c) The Secretary of War is only authorized to grant or refuse a permit. He has no power to regulate the diversion.

An examination of Sections 9 and 10 clearly discloses that there is not delegated to the Secretary of War, the power to supervise or regulate the operation of works placed in navigable waters of the United States. No such discretionary power is given. He has not the power to act as a supervising or construction engineer. He is merely to authorize the construction of certain specific works on plans recommended or approved by the Chief of Engineers.

With reference to the structures before the Court, as heretofore pointed out, he is merely to authorize the work that has been recommended by the Chief of Engineers. So, when the Secretary of War authorized the opening of the Sanitary & Ship Canal by removing the earth between the West Fork of the South Branch of the Chicago River and the excavated channel of the Sanitary & Ship Canal at its Northern Terminus, he had performed his duty; likewise his jurisdiction over the subject ended, and he could not thereafter regulate the operation of the Sanitary & Ship Canal.

The Secretary of War, by the order of December 5, 1901, boldly, by the use of the very words, assumes "to regulate" the diversion. (Appellant's Narrative, p. 24, 25.) The decree of the lower court seeks to enforce that order. Both the decree and the order of the Secretary of War attempt to regulate the diversion, a power clearly not existing in either the Secretary of War or the Court under said Rivers and Harbors Act of March 3, 1899.

IV.

REGARDLESS OF THE EFFECT OF THE ACT OF CONGRESS OF MARCH 2, 1827, PROVIDING FOR THE CONSTRUCTION OF THE ILLINOIS AND MICHIGAN CANAL ACROSS THE CONTINENTAL DIVIDE, AND THE INTERPRETATION OF SECTION 10 OF THE ACT OF MARCH 3, 1899, AS HERETOFORE STATED, NEVERTHELESS, THE ILLINOIS ACT OF MAY 29, 1889, UNDER WHICH APPELLANT HAS BUILT AND IS OPERATING ITS DIVERSION WORKS, IS VALID AND ENFORCEABLE, PURSUANT TO THE POLICE POWER RESERVED TO THE STATES UNDER THE CONSTITUTION. THE DIVERSION BY APPELLANT TO THE AMOUNT NECESSARY FOR THE OPERATION OF ITS WORKS IS LAWFUL WITHOUT EXPRESS CONSENT OF THE SECRETARY OF WAR. ANY OTHER CONSTRUCTION OF THE ACT OF MARCH 3, 1899, WOULD TEND TO NULLIFY APPELLANT'S ACTS IN THE INTEREST OF PUBLIC HEALTH. THIS RESULT CANNOT OBTAIN UNLESS SUCH CONGRESSIONAL INTENTION IS EXPRESSED IN PLAIN AND UNMISTAKABLE TERMS.

The proper consideration of the questions involved in this case, necessarily leads one to investigation and determination of the extent of the police powers expressly reserved to the States by the Tenth Amendment to the Constitution. It involves necessarily the construction of the Commerce clause of the Constitution and the various congressional acts in exercise of this power. We are not here concerned with any question as to whether Congress may not occupy the entire field concerning the regulation of navigable waters of the United States, whether wholly within or partly within and partly without the limits of a state, thereby intentionally excluding entirely state control over those waters within its limits. Obviously, Congress has not, under the Rivers and Harbors Act

of March 3, 1899, or any other act, attempted to enact legislation to exclusively control and regulate these navigable waters.

The question necessarily first arises as to whether the State's Act of May 29, 1889, authorizing the diversion of water by means of appellant's works, is inoperative so far as the diversion is concerned without express congressional authority; that is, without some act of Congress expressly and in unmistakable terms, authorizing this particular diversion and its amount. Was it intended by Congress to exclude the exercise by the state of its police power to protect the health of its people? The query is also presented whether the failure of the Secretary of War to give his consent to the abstraction of the water to the amount claimed by appellant that it requires, *ipso facto*, prevents said abstraction or withdrawal. The state being authorized to take such water from Lake Michigan as is reasonably required to protect the water supply of appellant's population, the Secretary of War cannot frustrate the state's efforts for this worthy purpose, by merely refusing his consent.

The situation would not be different had Congress plainly and unmistakably, by special act, authorized the State of Illinois to divert from Lake Michigan, 10,000 cubic seconds feet of water through its various diversion works, subject to the Secretary of War's authorizing, by permit, the work of deepening and widening the channels of the Chicago River and its branches to take through them this amount of water, without creating any current injuriously affecting navigation on said river channels. Appellant presents its plans for such work. Secretary of War approves them and authorizes the work. The Secretary of War then fails to remove a limitation fixed as to the amount of withdrawal made because of the then condition of the river channels as to shallowness and narrowness. The work is done. There is no objection or suggestion, by the Secretary of War in refusing to remove the limitation, that there are difficulties of navigation on the Chicago River by reason of

current resulting from appellant's abstraction. He arbitrarily refuses to remove the limitation, saying that he does not believe that the necessities of the occasion require it, or for any other reason, outside of the ones which he was authorized by the Congressional Act to consider. Such action obviously would entirely destroy the carrying out of the will of Congress under this supposed special act authorizing a definite amount of withdrawal. This very situation exists here for three reasons;

(1) The March 2, 1827 Act authorized the State of Illinois to build a canal and divert water for its uses, the amount of withdrawal to be determined by the State for the canal's purposes. The state has fixed that amount by the Act of May 29, 1889. Thus we have express congressional action for that amount of withdrawal.

(2) The Secretary of War has authorized *the work* as *recommended* by the Chief of Engineers, which work would result in the withdrawal of the water, to the extent of at least 10,000 cubic feet, and the altering or modifying of the navigable capacity of the navigable waters of the United States.

(3) The State likewise has reserved to it the police power to take the amount of water reasonably required for the purposes designed—namely the protection of the water supply of Chicago and its environs. Of course the amount must be determined by the State and Congress has not occupied the field to such an extent as to deny to the state that power.

In either one of the three instances above mentioned, the Secretary's refusal to remove the limitation of December 5, 1901, arbitrarily deprives the State of Illinois of enjoying that to which it is entitled under any one of these situations.

The cases which we desire to cite under this Point of our brief, are applicable to the various propositions suggested under this heading (Point IV), now to be discussed. Where a

case cited on one proposition applies to the others mentioned under this heading, we assume that they will be so considered, thus avoiding repetition.

(a) The Illinois Act of May 29, 1889, under which appellant was organized and exists, was sufficient legislative authority for the construction of appellant's various diversion works and for the diversion of water from Lake Michigan as required by such works.

This Act of May 29, 1889, of the Illinois General Assembly, rests upon the police power of Illinois reserved to it by the Constitution and never delegated to the Federal Government.

It had two objects: *first*, the protection of public health; *second*, the improvement of the state's waterways. There is no question raised in this record that the work provided for under this act and the diversion of water from Lake Michigan in the amount required by said act was not reasonably necessary to accomplish the objects and purposes of the legislation. The action of the state in this respect was taken deliberately, after thorough investigation and consideration. The necessity for the diversion and construction of the various diversion works, the Sanitary and Ship Canal and its adjuncts, for waterway purposes, has never been questioned. In fact, from the very time the old Illinois and Michigan Canal was built, its enlargement either by excavation in the canal itself or by the construction of the new canal paralleling it, and the diversion of large quantities of water for its operation and for the benefit of navigation on the Illinois River, was recommended continuously by government engineers. Contemplating the history of the development of this project, we find a unanimity of purposes for the development of this waterway.

In connection with the purpose sought—protection of the public health—the state likewise pursued the only course open to it. The old Illinois and Michigan Canal had been used as a partial outlet for the drainage and sewage finding its way

into the Chicago River, its South Branch and West Fork, to cleanse the river and to some extent keep pollution from the water supply. In the year 1871 it was enlarged at the expense of the City of Chicago to withdraw the water by gravity. In 1884, additional devices were provided, pumps at the northern terminus of the canal, to divert a greater quantity of water. The Continental Divide being insignificant at Chicago, made possible the passage of the drainage and sewage polluting water from Lake Michigan across it. It enabled Chicago to adopt the very best method to provide a pure and unpolluted water supply for its people. The alarming prevalence of typhoid fever epidemics aroused the people of Chicago to an appreciation of the dangers confronting the community. Chicago set about to solve this problem in a wise manner. She created in 1886 the Drainage and Water Supply Commission, which deliberately and carefully studied from health and waterway standpoints the entire problem, and recommended the construction of the works built by the Sanitary District—the Sanitary and Ship Canal and its adjuncts, and the diversion of water from Lake Michigan to operate them, as provided by statute.

The effect upon the Great Lakes System, navigable waters of the United States, if any, is entirely incidental to the carrying out of the purpose of the operation of appellant's works. The improvement of the channels of the Chicago River and its branches, the building of the Sanitary and Ship Canal and its various adjuncts, has admittedly improved and benefitted waterways within the State of Illinois. The channels of the Chicago River and its branches have been made deeper and wider and freed of all obstructions. The old Illinois and Michigan Canal between Chicago and Joliet, has been replaced or supplanted by the Sanitary and Ship Canal, of a size sufficient to meet all possible demands of commerce, and in keeping with the State and Federal intention, as to the canal's enlargement,—even the express congressional purpose under the Act of March 30, 1822.

Section 10 of the Rivers and Harbors Act of March 3, 1899, has been definitely construed by this Court in

Cummings v. *Chicago*, 188 U. S. 410,
Montgomery v. *Portland*, 190 U. S. 89.

In

Cummings v. *Chicago*, 188 U. S. 410,

Cummings proceeded to reconstruct a dock along the Calumet River, a river entirely within the state's limits. The dock was located within the City of Chicago. Cummings had obtained the consent of the Secretary of War to the doing of the work as recommended by the Chief of Engineers, but had failed to obtain the approval of the proper officer of the City of Chicago, as required by an ordinance of said city. It appeared, also, that Congress had provided for the improvement of this river by deepening and widening it, and it was claimed that thereby and in addition to the intention expressed by Secton 10 of the Rivers and Harbors Act of March 3, 1899, the United States had assumed exclusive jurisdiction over this river. The Secretary of War, in issuing his permit for the dock's reconstruction, recited the provisions of Section 10 of the 1899 Act and issued the permit thereunder. The Chicago authorities threatened to stop Cummings in his construction work, and the bill was filed to enjoin such threatened action on the ground that Cummings, by obtaining the Secretary of War's authority, was completely and fully authorised. It will be observed that a dock is not specifically mentioned in either Sections 9 or 10, but is likely the character of a structure mentioned in Section 10, such as pier, wharf, etc. At any rate, to build the dock it was necessary to excavate or fill in the Calumet River, a navigable water of the United States. This Court held that to fully empower Cummings to reconstruct the dock, it was necessary to have the approval of the City of Chicago, required under said ordinance, in addition to that of the Secretary of War; that when those two approvals were obtained, then the acts of Cummings would be entirely lawful; that under Section 10, the Secretary of War had the authority without any further

or other act of Congress specifically consenting to the reconstruction of this particular dock.

This Court, in passing upon this question, said:

(427) "Calumet river, it must be remembered, is entirely within the limits of Illinois, and the authority of the state over it is plenary, subject only to such action as Congress may take in execution of its power under the Constitution to regulate commerce among the several states. That authority has been exercised by the state ever since it was admitted into the Union upon an equal footing with the original states."

The Court further said (428):

"Did Congress, in the execution of its power under the Constitution to regulate interstate commerce, intend by the legislation in question to supersede, for every purpose, the authority of Illinois over the erection of structures in navigable waters wholly within its limits? Did it intend to declare that the wishes of Illinois in respect of structures to be erected in such waters need not be regarded, and that the assent of the Secretary of War, proceeding under the above acts of Congress, was alone sufficient to authorize such structures?"

Again, it is stated (430):

"If it had intended by the act of 1899 to assert the power to take under national control, for every purpose, and to the fullest possible extent, the erection of structures in the navigable waters of the United States that were wholly within the limits of the respective states, and to supersede entirely the authority which the states, in the absence of any action by Congress, have in such matters, such a radical departure from the previous policy of the government would have been manifested by clear and explicit language. In the absence of such language it should not be assumed that any such departure was intended."

* * *

"Whether Congress may, against or without the expressed will of a state, give affirmative authority to private parties to erect structures in such waters, it is not necessary in this case to decide. It is only necessary to say that the Act of 1899 does not manifest the purpose of Congress to go to that extent under the power to regulate foreign and interstate commerce and thereby to supersede the original authority of the states. *The effect*

of that act, reasonably interpreted, is to make the erection of a structure in a navigable river, within the limits of a state, depend upon the concurrent or joint assent of both the national government and the state government. The Secretary of War, acting under the authority conferred by Congress, may assent to the erection by private parties of such a structure. Without such assent the structure cannot be erected by them. But under existing legislation they must, before proceeding under such an authority, obtain also the assent of the state acting by its constituted agencies."

In

Montgomery v. *Portland*, 190 U. S. 89,

the Secretary of War had established, under the Congressional Act, harbor lines in the Willamette River. Likewise, harbor lines were established under state authority, which coincided with the harbor lines fixed by the Secretary of War, beyond which piers, wharfs, etc., could not be built. Montgomery obtained a changing of the harbor line by the Secretary of War, whereby the harbor line was extended further out into the stream, and the Secretary of War consented to his building his wharf there and beyond the harbor line fixed by state authority. He proceeded to build his wharf on the line last fixed by the Secretary of War, and the City of Portland filed its bill in the State Court to enjoin construction, and the case reached this Court by writ of error to the Supreme Court of Oregon. The Court reiterated its holding in the *Cummings case*, and held that to permit Montgomery to construct his wharf on the new line fixed by the Secretary of War, it was necessary also to obtain the state's consent. It then said (p. 107):

> "It is sufficient now to say that the legislation upon which the defendant relies to justify the construction of the works in question does not, when reasonably interpreted, indicate any purpose upon the part of Congress to assume such complete and absolute control of the navigable waters of the United States as will make of no avail the action of the states in respect of the erection by private parties of structures in waters wholly within their respective limits."

Ths Court, in the *Cummings* and *Montgomery cases, supra*, held that the state's authority was concurrent with that of the Federal Government under the Rivers and Harbors Act of March 3, 1899, and that the state's direct regulation of navigable waters within its limits had not been denied or superseded by the legislation mentioned. How much stronger is the case where the state's action is in the interest of public health, as here, and where the principal effect of appellants works upon navigation is in aid thereof and the claimed injury, if any, to commerce is only indirect and incidental.

In

Corrigan Transit Company v. *The Sanitary District of Chicago*, 137 Fed. 851, (C. C. A. 7th Circuit),

the permit of May 8, 1899, authorizing the opening of appellant's Sanitary and Ship Canal, was directly under consideration. The suit was filed by the Corrigan Transit Company to recover damages to a boat which damage it was claimed resulted from the current in the Chicago River created by appellant's diversion. The Court held that the recitals or preambles of the permit of May 8, 1899, did not limit the granting clause—namely, to open the channel; that therefore the permit was unlimited. In other words, there was express authority from the Secretary of War to operate the Sanitary and Ship Canal to its full capacity.

In speaking of the effect of Section 10 of the Rivers and Harbors Act of March 3, 1899, the Court of Appeals, speaking through Mr. Justice Baker, said (p. 856):

> "Congress, acting under the commerce clause, said to Illinois, which would otherwise be sovereign, 'You are not to change the course of the river unless you first obtain the secretary's approval of your plan.' The sentence in its entirety—the subjunctive clause as well as the indicative—expressed the will of Congress. The expressed intention was, not to exclude Illinois utterly from exercising her police powers over the river for the welfare of her citizens (and that suggests a nice and delicate question), but to permit the continuation of the exercise upon condition. Now, if the conditional clause is to be deleted, it is not for the courts to construct a new

congressional policy out of the fragment. Compare *Montgomery* v. *Portland*, 190 U. S. 105, 23 Sup. Ct. 735, 47 L. Ed. 965.

(4) If section 10 stands, libelants' attack fails, because defendant obtained the permit and complied with its conditions. If section 10 falls, what is the result? If a matter affecting commerce is of national scope and susceptible of uniform regulation, the failure of Congress to speak to the subject is deemed equivalent to a declaration that the states shall let the matter alone; but if the matter is local, and concerns the public policy of a state, though it may incidentally affect interstate and foreign commerce, congressional inaction is a recognition that the subject is fitted for local regulation, and is an invitation that the state continue in the unimpeded exercise of its police powers, on the understanding, however, that Congress may thereafter intervene to the extent, at least, of destroying and forbidding whatever unnecessarily embarrasses commerce. *Covington Bridge Co.* v. *Kentucky*, 154 U. S. 204, 14 Sup. Ct. 1087, 38 L. Ed. 962; *Lake Shore, etc., Ry. Co.* v. *Ohio*, 173 U. S. 285, 19 Sup. Ct. 465, 43 L. Ed. 702, and cases therein cited. The bridging, dredging, purification of a navigable waterway wholly within a state are matters of the latter class. *Escanaba Transp. Co.* v. *Chicago*, 107 U. S. 678, 2 Sup. Ct. 185, 27 L. Ed. 442; *Lake Shore, etc., Ry. Co.* v. *Ohio*, 165 U. S. 365, 17 Sup. Ct. 357, 41 L. Ed. 747. With the commerce clause in abeyance, Illinois, as to every being in the world except future Congresses, was absolute sovereign in the premises. The absolute sovereign may change the grade of highways or may vacate them, may alter the courses and currents of rivers or may dam or fill them up, and neither alien nor subject traveler and navigator may complain. No one can claim a vested right to have the United States interfere with Illinois, nor can a cause of action arise from want of interference."

The work of excavating to provide for the diversion has been authorized by the Secretary of War and recommended by the Chief of Engineers. The reversal of the course and current of the river, has likewise been authorized. The connection of the Sanitary and Ship Canal with the West Fork of the South Branch of the Chicago River, was approved. Everything for the lawful diversion to the full capacity of the Sanitary and Ship Canal has been obtained.

In

Canada Atlantic Transit Company v. *Chicago*, 210 Fed. 7, (C. C. A. 7th Circuit),

the court had before it an ordinance of the City of Chicago requiring that vessels navigating the Chicago River when passing any bridge, shall move at a rate of speed not less than two miles per hour, and that steam vessels of 1,200 gross tons burden, or more, while navigating certain portions of the river, shall have the assistance of a tug or tugs. The court held the ordinance valid, and that it was within the province of the state, acting through the City of Chicago, to make such regulation. It also held that the reasonableness of the ordinance was not to be questioned, saying, through Judge Seaman:

(10) "All the contentions on behalf of the appellants in derogation of such power inherent in the state, must be overruled".

With reference to the inherent power of the state the court said:

(11) "Neither preponderance of evidence nor proof which convinces the court of want of justifiable cause for the requirements, can serve to authorize judicial interference with legislative action upon a subject within the power of the state or municipal legislation."

The Court cited upon this proposition the strong statement of Mr. Justice Holmes in *Laurel Hill Cemetery* v. *San Francisco*, 216 U. S. 358.

We apprehend that the capacity of the navigable water of the United States may be altered or modified in the way provided by said ordinance mentioned in Canada Atlantic Transit Co., *supra*, just as completely, so far as the effect upon commerce is concerned, as they may be altered by excavation or filling in such navigable waters.

We refer the Court to the following cases:

Escanaba L. M. Transportation Company v. *Chicago*, 107 U. S. 678.

Lake Shore & Michigan Southern Railroad Company v. *Ohio*, 165 U. S. 365.

Cardwell v. *American River Bridge Company*, 113 U. S. 205.

Huse v. *Glover*, 119 U. S. 543.

Willamette Iron Bridge Company v. *Hatch*, 125 U. S. 1.

The creation of the appellant's Sanitary and Ship Canal and its other diversion works, was "authorized by law" under the Rivers and Harbors Act of September 19, 1890.

United States v. *Bellingham Bay Boom Co.*, 176 U. S. 211.

The Act of March 3, 1899, declaring that obstructions "not authorized by Congress" were prohibited (Section 10), did not intend to make unlawful those things lawfully provided for under the 1890 Act.

(b) The diversion by appellant to the amount necessary for the operation of its works, is lawful without the express consent of the Secretary of War. Any other construction of the Act of March 3, 1899, would tend to nullify appellant's acts in the interest of public health. This result cannot obtain unless such congressional intention is expressed in plain and unmistakable terms.

The position boldly taken by appellee is that Congress has provided that nothing shall be done affecting navigable waters of the United States unless the consent of the Secretary of War has been obtained, and that the diversion beyond 4,167 seconds feet is unlawful unless the Secretary of War has directly and in terms consented to it. It is immaterial, says appellee, for what reason the Secretary of War has failed to expressly authorize the excess diversion. We have shown that the work of excavating in the channels of the Chicago River for the purpose of withdrawing water to the full capacity of appellant's Sanitary and Ship Canal was authorized

by the Secretary of War; that he had directed and authorized the opening of this canal and its connection with the river; that the permit of May 8, 1899, so authorizing, was unlimited except by the maximum capacity in the Sanitary and Ship Canal; and that the Secretary of War had limited the withdrawal by his order of December 5, 1901, before the work of excavating, pursuant to the Secretary of War's authority of July 11, 1900, had been commenced or completed. We have then, under the July 11, 1900 permits, direct authority to alter or modify the navigable capacity of the navigable waters of the United States, wherever situated, necessary or resultant from the work of excavating which had been done. We have, on the other hand, a supposed limitation of the amount of withdrawal, never removed, which is in conflict with the permits of July 11, 1900. There is also the refusal of the Secretary of War to remove the limitation—not because of any condition expressed in the May 8, 1899 permit, but because of the claimed injury or obstruction to navigable waters other than the Chicago River—namely, the Great Lakes and their connecting channels. However, the Great Lakes and their connecting channels were waters, if the appellee's contention is correct as to the effect of the diversion thereon, which would be altered or modified by the doing of the work of excavating authorized by the Secretary of War under the July 11, 1900 permits.

We lay aside, for the moment, all these circumstances relating to the unreasonableness of the Secretary of War's action in failing to remove the limitation of December 5, 1901, and our contention that the diversion is lawful for the reason that the work necessary to accomplish the diversion of 10,000 cubic seconds feet of water through the channels of the Chicago River and its branches to the Sanitary and Ship Canal has been fully authorized.

The acts of appellant, taken pursuant to the state's police power, in diverting the amount of water required for sanitary purposes and the protection of the water supply, must stand as lawful, without the express consent of the Secretary

of War. These acts, under the undoubted reserve power of the state, must prevail over the acts of or failure to act by the Secretary of War, unless it is clear that Congress intended otherwise. There is no such intention expressed in any Congressional act. It has always been recognized by this Court that the protection of public health by the states is paramount. Congressional acts or authority apparently in conflict with such acts taken by the state must be so reconciled that the state may be left unfettered in the exercise of such police power. Of course, it is assumed that in such instances the state's acts are reasonably necessary to accomplish the purpose desired.

In

Columbus v. *Mercantile Trust Co.*, 218 U. S. 645,

this court said, (658):

> "No higher police duty rests upon the municipal authority than that of furnishing an ample supply of pure and wholesome water for public and domestic uses."

In

Missouri v. *Kansas Natural Gas Co.*, 68 L. Ed. Advance Sheets p. 585, June 16, 1924,

this court held that the State of Kansas was without power to fix rates of gas sold by a supply company transporting the gas in mains from outside the state. In no instance did the supply company sell the gas directly to consumers but merely sold it to distributing companies, who thereupon transmitted and sold it to individual concerns. This followed the holding in the case of

Public Utilities Commission v. *Landon*, 249 U. S. 236.

However,

Pennsylvania Gas Co. v. *Public Service Commission*, 252 U. S. 23,

was a case where the gas was transmitted from Pennsylvania directly to the consumers of the gas in Jamestown, New York. The acts taken under the authority of the State of

New York in fixing the price of gas to the consumers was held valid by this court. In distinguishing that case, this court said, in

Missouri v. *Kansas Natural Gas Co., supra,* (p. 587)

"The service to the consumers, which was the thing for which the regulated charge was made, was essentially local, and the decision rests upon this feature."

In

Texas v. *White,* 7 Wall. 700, 725,

it is stated:

"But the perpetuity and indissolubility of the Union by no means implies the loss of distinct and individual existence, or of the right of self-government by the states. * * * The Constitution, in all its provisions, looks to an indestructible Union, composed of indestructible states."

In

New York v. *Miln,* 11 Peters 102, 139,

a penalty was provided by the state for the failure of a ship's master to, within twenty-four hours, report the names, age and last settlement of persons on board the vessel arriving at port. This court said:

"It is not only the right, but the bounden and solemn duty of a state to advance the safety, happiness and prosperity of its people, and to provide for its general welfare by any and every act of legislation which it may deem to be conducive to these ends."

The delimitation between the state's police powers and the powers exercised under the Commerce Clause of the Constitution of Congress was so thoroughly discussed by this court in

Minnesota Rate Cases, 230 U. S. 352,

that is seems unnecessary and useless to attempt to add any thing to the opinion in that case. In that case this court said (402):

"Further, it is competent for a state to govern its internal commerce, to provide local improvements, to cre-

ate and regulate local facilities, to adopt protective measures of a reasonable character in the interest of the health, safety, morals and welfare of its people, although interstate commerce may incidentally or indirectly be involved."

In

Lake Shore & Michigan Southern v. *Ohio*, 173 U. S. 285,

a state law providing for stops of trains at certain stations was upheld, even though it operated upon interstate trains.

In

Hennington v. *Georgia*, 163 U. S. 299,

a state law providing against the operation of all trains on Sunday, state or interstate, was upheld. This court said (317):

> *"Legislative enactments of the states passed under their admitted police powers, and having a real relation to the domestic peace, order, health and safety of their people, but which, by their necessary operation, affect, to some extent, or for a limited time, the conduct of commerce among the states are yet not invalid by force alone of the grant of power to Congress to regulate such commerce."*

It is the rule, many times repeated, that the power of Congress under the Commerce Clause of the Constitution is a dormant one and remains in the states until Congress occupies the field or assumes the power; yet it is also the established rule that without the exercise of specific power interstate commerce must be free. Any law of the state directly obstructing such commerce is invalid. So the cases upholding state laws, passed in the interest of public health, safety or morals, which operate indirectly in obstructing interstate commerce, are in point in determining the validity of similar acts of the state which indirectly affect or burden some regulation of such commerce expressly provided by Congress. In such situation, unless the congressional act clearly and plainly shows that Congress intended to cut the state off from any exercise of authority on the subject, the state act

will prevail. Here we have the acts of appellant, taken in the exercise of the highest order of police power by the state, requiring the withdrawal of water from Lake Michigan to the amount of at least 10,000 cubic seconds feet, indirectly affecting, as it is claimed by appellee, interstate commerce by reason of the lowering of the surface elevations of the Great Lakes and their connecting channels. There is no claim that this obstruction of navigation—lowering the lake surfaces—absolutely stops interstate commerce, but merely inconveniences it or makes it slightly more expensive.

In

Hennington v. *Georgia, supra,*

the state's statute against the operation of any and all trains on Sunday absolutely stopped interstate commerce by railroad through the state one-seventh of the time. But, as the court said, this was not intended to be a direct burden upon interstate commerce, but was merely intended to express the will of the people of Georgia on the question of whether the Sabbath day should be observed in a certain manner, *and only incidentally affected interstate commerce.*

In

Crossman v. *Lurman*, 192 U. S. 189,

the constitutionality of the State Pure Food Law was upheld. There was also a federal act involving the same subject.

In

Plumley v. *Massachusetts*, 155 U. S. 461,

the oleomargine law was held constitutional, even though it operated indirectly as a burden upon interstate commerce.

Also see

In re Rahrer, 140 U. S. 545, 554.

In

Mutual Loan Co. v. *Martell*, 222 U. S. 225,

a state statute declaring invalid assignments of wages unless accepted by the employer and filed and recorded in a certain manner, was upheld, this court saying (p. 233):

> "Legislation cannot be judged by theoretical standards. It must be tested by the concrete conditions which induced it."

The repugnance of the Congressional Act must be direct and positive in order that the state's acts may be held invalid.

In

Cummings v. *Chicago*, 188 U. S. 410, 430,

the court, in speaking of this very question, said:

> "In the absence of such language, it should not be assumed that any such departure was intended"—
>
> *Savage* v. *Jones*, 225 U. S. 501.

In

Missouri, Kansas & Texas Ry. Co. v. *Haber*, 169 U. S. 613,

the state act with reference to the importation into the state of diseased cattle was upheld, although there was a federal statute pertaining to the same subject matter. This court said, (623):

> "May not these statutory provisions stand without obstructing or embarrassing the execution of the Act of Congress? * * * *A statute* enacted in the execution of a reserved power of the state is not to be regarded as inconsistent with an Act of Congress passed in the execution of a clear power under the Constitution, unless the repugnance or conflict is so direct and positive that the two acts cannot be reconciled or stand together."

In

Reid v. *Colorado*, 187 U. S. 137, 148,

the state cattle inspection law was upheld. This court said:

> "It should never be held that Congress intends to supersede, or by its legislation suspend the exercise of the

police powers of the states, even when it may do so, unless its purpose to effect that result is clearly manifested."

In

Sinnott v. *Davenport*, 22 How. 227,

the state's ship registration law was upheld. This court said, (243):

"* * * in the application of this principle of supremacy of an Act of Congress in a case where the state law is but an exercise of a reserve power, the repugnance or conflict should be direct and positive, so that the two acts could not be reconciled or consistently stand together; * * *"

In

Missouri Pacific R. R. Co. v. *Larabee Flour Mills Co.*, 211 U. S. 612,

this court said, (623):

"Running through the entire argument of counsel for the Missouri Pacific is the thought that the control of Congress over interstate commere, and a delegation of that control to a commission, necessarily withdraws from the state all power in respect to regulations of a local character. This proposition cannot be sustained. Until specific action by Congress or the Commission, the control of the state over these incidental matters remains undisturbed."

In

Missouri, Kansas & Texas R. R. Co. v. *Harris*, 234 U. S. 412, 418,

the court, in speaking of the powers of the Interstate Commerce Commission, as affecting state regulations, said:

"These cases recognize the established rule that a state law enacted under any of the reserved powers—especially if under the police power—is not to be set aside as inconsistent with an Act of Congress, unless there is actual repugnancy, or unless Congress has, at least, manifested a purpose to exercise its paramount authority over the subject. *The rule rests upon fundamental grounds that should not be disregarded.*"

In

Carey v. *State of South Dakota*, 250 U. S. 118,

a state statute relating to the shipment out of the state of migratory birds was upheld. This court said, (122):

> "It is, however, urged that Congress has manifested its intention to assume exclusive jurisdiction of the subject; and that the failure to make any provision in the Federal act concerning shipping evidences the purpose of Congress that the shipping of game birds shall not be prohibited. This argument rests upon the clause which declared that the migratory birds 'shall hereafter be deemed to be within the custody and protection of the government of the United States.' But that clause may not be read without its context; and the words immediately following show that the custody and protection is limited to prohibiting their being 'destroyed or taken contrary to regulations' which are to fix the closed seasons in the several zones. If, reading the Federal act as a whole, there were room for doubt, two established rules of construction would lead us to resolve the doubt in favor of sustaining the validity of the state law. *First*: The intent to supersede the exercise by a state of its police powers is not to be implied unless the act of Congress, fairly interpreted, is in actual conflict with the law of the State. *Savage* v. *Jones*, 225 U. S. 501, 533, 56 L. ed. 1182, 1194, 32 Sup. Ct. Rep. 715; *Missouri, K. T. & R. Co.* v. *Haber*, 169 U. S. 613, 623, 42 L. ed. 878, 881, 18 Sup. Ct. Rep. 488. *Second*: Where a statute is reasonably susceptible of two interpretations, by one of which it would be clearly constitutional and by the other of which its constitutionality would be doubtful, the former construction should be adopted."

In

Houston, East & West Texas Ry. Co. v. *U. S.* 234 U. S. 342,

(the *Shreveport cases*), the order of the Interstate Commerce Commission was upheld because it was clear and plain in such order that it was the intention to hold certain intrastate rates to be discriminatory against certain interstate rates, and the removal of this discrimination was unmistakably directed. However, in

Illinois Central R. R. Co. v. *Public Utilities Commission*, 245 U. S. 493,

this court did not permit the order of the Interstate Commerce Commission to override that of the Public Utilities Commission of Illinois for the reason that the order of the Interstate Commerce Commission was uncertain and indefinite, and did not clearly express an intention so to do.

The court said, (510):

"In construing Federal statutes enacted under the power conferred by the commerce clause of the Constitution the rule is that *it should never be held that Congress intends to supersede or suspend the exercise of the reserved powers of a state, even where that may be done, unless, and except so far as,* its purpose to do so is *clearly manifested.* * * * (Citing numerous cases.) This being true of an act of Congress, it is obvious that an order of a subordinate agency, such as the Commission should not be given precedence over a state rate statute otherwise valid, unless, and except so far as, it conforms to a high standard of certainty.

"We conclude that the uncertainty in this order is such as to render it inoperative and of no effect as to the intrastate rates established and maintained under a law of the state, and therefore that the suits by the carriers were rightly dismissed on the merits."

In

Sligh v. *Kirkwood,* 237 U. S. 52,

held the statute of Florida against offering for sale or shipment decayed fruits, valid. This court said:

(60) "Nor does it make any difference that such regulations incidentally affect interstate commerce, when the object of the regulation is not to that end, but is a legitimate attempt to protect the people of the state."

* * *

"and whether such regulation is necessary in the public interest is primarily within the determination of the legislature, assuming the subject to be a proper matter of state regulation."

In

Hammer v. *Dagenhart,* 247 U. S. 251,

which case involved the validity of the Child Labor Law, this court said:

(p. 273)

"The grant of power to Congress over the subject of interstate commerce was to enable it to regulate such

commerce, and not to give it authority to control the states in their exercise of the police power over local trade and manufacture.

"The grant of authority over a purely Federal matter was not intended to destroy the local power always existing and carefully reserved to the states in the 10th Amendment to the Constitution.

"Police regulations relating to the internal trade and affairs of the states have been uniformly recognized as within such control."

* * *

(p. 275)

"* * * The maintenance of the authority of the states over matters purely local is as essential to the preservation of our institutions as is the conservation of the supremacy of the Federal power in all matters intrusted to the nation by the Federal Constitution."

(p. 276)

* * *

"* * * This court has no more important function than that which devolves upon it the obligation to preserve inviolate the constitutional limitations upon the exercise of authority, Federal and state, to the end that each may continue to discharge, harmoniously with the other, the duties intrusted to it by the Constitution."

* * *

(p. 276)

"* * * Thus the act in a twofold sense is repugnant to the Constitution. It not only transcends the authority delegated to Congress over commerce, but also exerts a power as to a purely local matter to which the Federal authority does not extend."

With the language of the above case in mind, consider the situation of the people residing within appellant's territorial limits, and the geographical location of Chicago, with its ever-increasing activity in trade and commerce, situated, as it is, at the lower end of Lake Michigan. We have, on the one side, the immense transportation facilities of the Great Lakes connecting, through the St. Lawrence River and the Erie Canal with the Atlantic Ocean. Chicago is the gateway also to the great transportation system of the Mississippi River and its tributaries. This transportation system reaches ap-

proximately fourteen of the richest states of the Union— not only in the fertility of soil but in the production of minerals and manufactures. Chicago is one of the termini of practically all of the great railroad systems of the country. Almost forty years ago her population reached approximately 1,000,000 people—greater than is now the population of either Cleveland, Detroit, Buffalo or other great cities on the Lakes. Her only water supply was Lake Michigan. Unless her sewage and drainage could be diverted from Lake Michigan to the Illinois River, it was necessary that it be discharged either through the Chicago River or by means of sewers or otherwise into Lake Michigan. The only way that a pure water supply for this vastly increasing population could be obtained was by diverting the sewage and drainage from the Lake. The people of Chicago would have been derelict in their duty to the nation, to themselves and to posterity if they had not availed themselves of the only opportunity they had to provide a pure water supply. There are no cities of any size in the United States, except those cities located upon the shores of the Great Lakes, that are compelled to obtain a water supply from a source (the Lake) which also is the place into which the city is naturally drained. Chicago is the only one of these cities that had the opportunity to do what other cities of the United States of size do—namely, to obtain water from an unpolluted source and discharge sewage into streams that do not constitute a water supply for any considerable population. The Desplaines and Illinois Rivers have not been and are not a water supply for human beings.

Other large cities located on the shores of the Great Lakes are only, now, at this late date confronted with the problem that Chicago had forty years ago. The people of Chicago and environs proceeded to cause the construction by appellant of the works necessary for and provided for themselves a pure water supply at an expense of approximately a hundred million of dollars. The only objections that have ever been made to this plan have just recently arisen from navigation inter-

ests which operate ore-carrying vessels, and from the water power interests on the Niagara and St. Lawrence. This geographical situation of Chicago invited and required the protection of the water supply of the people of Chicago by diverting the sewage and drainage from Lake Michigan, with the necessary abstraction of water to accomplish that purpose. This whole problem is one of local concern. It can be best handled by local authorities whose interests are the securing of the proper results, and whose acts should be unquestioned. The effect upon navigable waters whether wholly within the state or outside is purely incidental, and, in fact, more helpful than harmful.

These facts lend further force to the proposition that the Act of Congress of March 3, 1899 and the action of the Secretary of War thereunder, shall not be deemed repugnant to the state acts unless the intention of Congress so to do is expressed in the very clearest language.

In the Child Labor Tax case,

Bailey v. *Drexel Furniture Co.*, 259 U. S. 20,

this court, in speaking of the principles here contended for, and so admirably stated in the numerous cases above cited, pointing out the necessity of adherence to them, said, (37):

> **"In the maintenance of local self-government, on the one hand, and the national power, on the other, our country has been able to endure and prosper for nearly a century and a half."**

It is thus apparent that Section 10 of the Rivers and Harbors Act of March 3, 1899, and the acts of the Secretary of War thereunder, cannot be construed as repugnant to the Illinois Act of May 29, 1889, and to the operation of the works of appellant built thereunder.

Charles Warren, in his work entitled

"The Supreme Court in United States" (1922), Vol. 3, page 464,

in speaking of this Court's attitude in cases involving the police power of the states, said:

> "It may fairly be said that the support which the court has thus given to the police power of the states has been

one of the most remarkable features of its career. Certainly a litigant who hopes to overturn the deliberate judgment of a State Legislature, as expressed in this form of legislation, has a very scanty hope of assistance from the court."

Again the author states (466):

"The doctrine which the court has finally worked out in deciding these constitutional cases may be summed up briefly as the recognition of 'the paramount right of public necessity.'"

(c) Congress has otherwise by legislation indicated that it was not its intention to prohibit the operation of appellant's diversion works, or that any act of any of its officers should have that effect.

We have in the statement of this case (p. 48) set forth various acts of Congress indicating that it was the Congressional intention that appellant's diversion should proceed as required by state law, unhindered; that no executive officer was empowered to limit it, and that if any regulation was to be made of this diversion, it would be done by Congress in the future.

In the very Rivers and Harbors Act of March 3, 1899 (Statement 49), containing Section 10, upon which appellee relies for the Secretary of War's authority, there is an item providing for a survey for the improvement of the Illinois and Des Plaines River *"with a view to the extension of navigation from the Illinois River to Lake Michigan at or near Chicago * * * in pursuance of and according to the recommendations in the report of January 27, 1897."* The report referred to was the one made by Major Marshall pursuant to a previous act of Congress. This report described in detail appellant's Sanitary and Ship Canal, its size and the purpose of diverting at least 600,000 cubic feet of water from Lake Michigan through it—that is, its capacity (Statement, p. 48).

Certainly it cannot be conceived, in view of the attitude of Congress as to the powers of the states over local matters,

particularly those matters affecting public health, that Congress intended by inference merely under Section 10 to delegate the regulation of appellant's works to an executive officer. These works had been constructed over a period of ten years, and the purpose of the construction was well known. The progress of the work had been reported to Congress almost yearly by means of the Chief of Engineers' reports. The purpose of Congress in requiring these reports was to obtain each year specific information with reference to the condition of navigable waters, in order to determine whether there were encroachments which might not be in accordance with the will of Congress. If it found that there were works being built that would operate as undesirable obstructions to navigation, it could and would have specially legislated. Some specific langauage would have been used indicating the clear intention of Congress that the Secretary of War should regulate this diversion, if that were the Congressional intention.

Congress followed this procedure with reference to the encroachments of the Chandler-Dunbar Water Power Co. in the St. Mary's River. It, in that case, specially legislated with reference to these various obstructions, canceling all permits and licenses in existence and directing the Secretary of War to take proceedings to remove these obstructions.

United States v. *Chandler-Dunbar W. P. Co.*, 229 U. S. 51.

The Rivers and Harbors Act of June 6, 1900, contained a provision for the continuing of the survey provided for by the Act of 1899 (specially mentioning appellant's Sanitary and Ship Canal)

> "for a channel 14 feet deep through said proposed route, and that said estimates cover and include a proper connection *at Lockport with the Sanitary and Ship Canal, which has been constructed by the Sanitary District of Chicago.*" (Statement p. .)

In the Rivers and Harbors Act of June 13, 1902, further survey was provided for

> "from Lockport, Illinois, by way of the DesPlaines and Illinois Rivers, to the mouth of the said Illinois River,

and from the mouth of the Illinois River by way of the Mississippi River to St. Louis". (Statement, p. 49.)

Section 4 of the same act provided for the establishment of the International Waterways Commission. This commission was to make a study of the conditions of all boundary waters upon which a treaty might be framed, and also

"upon the effect upon the shores of these waters and the structures thereon, and upon the interests of navigation by reason of the diversion of these waters from or change in their natural flow, and further to report upon the necessary measures to regulate such diversion and to make such recommendations for improvements and regulations as shall best serve the interests of navigation in said waters". (Statement, 50.)

The above quotation from the Rivers and Harbors Act, referred directly to the Chicago diversion. The International Waterways Commission understood that the clause referred to the Chicago diversion, for it made several reports regarding it, including the special report upon the Sanitary and Ship Canal and its operation of January 4, 1907. (Appellant's Narrative, 505.) This Commission found the diversion of 10,000 seconds feet to be an existing fact, and that in dividing the water of the Niagara River between the United States and Canada for electric power purposes, the United States should be charged with the 10,000 seconds feet diversion, and that the State of Illinois and appellant were entitled to that diversion. The treaty itself followed the recommmendations of the International Waterways Commission in practically every respect. It preserved to the State of Illinois this diversion.

On April 21, 1904, Congress passed a resolution authorizing the Secretary of War to permit appellant to cut down the crests of the government dams in the Illinois River. (Statement 51.) The only purpose of this was to remove an obstruction to the flow in the Illinois River, and to arrange the river so that it would better carry appellant's additional diversion;—that is, the diversion that was or would be made

possible by the work of excavating in the channels of the Chicago River and its branches under the permits of the Secretary of War of July 11, 1900.

The Act of Congress of June 29, 1906, for the preservation of Niagara Falls (Statement 51) provided in Section 1:

> "That the diversion of water from Niagara River or its tributaries, in the State of New York, is hereby prohibited, except with the consent of the Secretary of War as hereinafter authorized in section two of this Act; *Provided, That this prohibition shall not be interpreted as forbidding the diversion of the waters of the Great Lakes or of Niagara River for sanitary or domestic purposes, or for navigation, the amount of which may be fixed from time to time by the Congress of the United States or by the Secretary of War of the United States under its direction.*"

The foregoing Act related to the preservation of Niagara Falls, which was being injured primarily by the use of the waters of the Niagara River for the development of water power. If the Rivers and Harbors Act of March 3, 1899, authorized the Secretary of War to regulate diversions of water, there would have been no occasion for the passage of this Act, for the Secretary of War could have regulated or limited diversions of water from the Niagara River for water power purposes under the 1899 Act as well as under the Act just quoted. Congress carefully by the proviso mentioned, indicates its intention that, under no circumstances, not even for the preservation of the scenic beauty of the Falls, shall the diversion at Chicago for domestic and sanitary purposes be affected, except as Congress may thereafter fix the amount. The words

> "or by the Secretary of War of the United States under its direction,"

mean that the Secretary of War may be *thereafter* directed how to fix that diversion. These words absolutely negative the idea that the Secretary of War was *then* authorized under any Act of Congress to fix the amount of the diversion. *No*

Act has been passed since authorizing the Secretary of War to limit or in any way affect the diversion for sanitary purposes.

Senator Lodge's statement in the United States Senate upon the report of the conferees concerning Senator Hopkins' amendment, leaves no doubt as to the intention of Congress as expressed by the proviso in Section 1 of said act for the preservation of Niagara Falls. It will be recalled that Senator Lodge said, as to his understanding of the meaning of the proviso and that of the conferees of the House and Senate—

> "The first section of the bill protects the right of Chicago." (Statement 53.)

The Rivers and Harbors Act of Congress of June 25, 1910, provided for a survey for the improvement of the waterway

> "from Lockport, Illinois, by way of the DesPlaines and Illinois Rivers to the mouth of said Illinois River",

and appropriated one million dollars for its construction. The Board of Engineers to be established, was to report

> "upon such measures as may be required to properly preserve the levels of the Great Lakes and to compensate, so far as practicable, for the diminished levels in said lakes and the connecting waters thereof, by reason of any diversion of water from Lake Michigan for the maintenance of the proposed waterway herein described, or diversion for any other purpose."

Here was a direct reference to the Chicago diversion. It speaks of a diversion for waterway purposes

> "or for any other purpose"

from Lake Michigan. There was and is no other diversion from Lake Michigan than the Chicago diversion. The Board of Engineers which was appointed under that act, made a report to Congress upon the diversion at Chicago and the means by which the surface elevations of the lakes could be restored. (Statement 71.) Certainly it is plain that it was not the intention of Congress that this abstraction of water from Lake Michigan for health purposes, should be limited or regulated. It is further clear that Congress did not under-

stand that by any previous act an executive officer had been empowered to frustrate the acts of the State of Illinois in the interest of the health of its people.

June 30, 1917, by resolution of Congress, the Secretary of War was authorized to cause a report to be made upon

> "the entire subject of water diversions from the Great Lakes and from the Niagara River, including nagivation, sanitary and power purposes". (Statement 55.)

The report was made. (Appellant's Narrative, p. 102.)

In

> *International Bridge Company* v. *People of State of New York*, 254 U. S. 126,

suit was instituted by the State of New York against the Bridge Company to collect certain penalties arising under a statute of New York of 1915 amending the charter of the International Bridge Company by directing that the bridge company construct a foot path across the bridge. The bridge was constructed under an act of the State of New York passed prior to 1870, and an act of Congress of 1870, authorizing the bridge company to construct a bridge across the International Stream, subject to plans being approved by the Secretary of War. Another act of Congress was passed later which found the bridge to be a lawful structure. There were reciprocal acts of Canada.

Was the Act of New York of 1915 providing for the foot path for the International Bridge valid? The court said:

> (131) "The only argument that impresses us, and the one that was most pressed, is that this is an international bridge, and that Congress has assumed such control of it as to exclude any intermeddling by the state. It is said that the bridge as constructed was and is devoted wholly to international commerce, and that when Congress authorized it in that form in 1874, that authority must be regarded as the charter under which it was maintained. Without repeating the considerations urged in support of this conclusion we will state the reasons that prevail with us. The part of the structure with which

we are concerned is within the territorial jurisdiction of the state of New York.

* * *

"Not only the existence of the company but its right to build upon New York land, came from New York, * * *.

* * *

"From an early date the state has been recognized as the source of authority, in the absence of action by Congress. * * * And this court has been slow to interpret such action as intended to exclude the source of rights from all power in the premises."

In

West Chicago Street R. R. Co. v. *People of Illinois*, 201 U. S. 505, 527,

this Court held that the approval of the Secretary of War was not necessary for the lowering of tunnels under the Chicago River as directed by an ordinance of the City of Chicago; and that Congress intended, by the Rivers and Harbors Act of March 3, 1899, that the work of "lowering tunnels," etc., to provide a twenty-one-foot depth in the Chicago River, should be done by Chicago,

"to give the assent of the United States to any work done by the City towards accomplishing the end which the Government had in view."

The lowering of the tunnels was part of the river enlargement work, under the July 11, 1900 permits, for appellant's 10,000 c. s. f. diversion through the Chicago River to the Sanitary & Ship Canal.

V.

APPELLEE HAS INVITED AND ACQUIESCED IN THE CONSTRUCTION BY APPELLANT OF ITS SANITARY AND SHIP CANAL TO DIVERT WATER FROM LAKE MICHIGAN TO THE AMOUNT REPRESENTED BY THE CAPACITY OF SAID CANAL. IT IS ESTOPPED NOW TO DENY THE RIGHT.

The Illinois and Michigan Canal as originally built was only a make-shift. It did not meet the ideas of the state and federal government for the creation of a waterway from Lake Michigan to the Illinois and Mississippi Rivers. As will be recalled from the statement of the case herein, hardly had the old Illinois and Michigan Canal been opened, than a demand immediately arose for its enlargement and for the diversion of water from Lake Michigan not only to operate the enlarged canal, but to furnish better navigable facilities on the Illinois River. The resolution of Illinois General Assembly of 1861, the Congressional Act for the survey of waterway of 1866, the provision for the other surveys following, are all important. The surveys made prior to the passage of the Act of May 28, 1889, all recommended that the waterway be improved by the building of an enlarged canal with the diversion of water to operate it. (Statement, p. 19.)

After the Act of May 29, 1889, was passed, the surveys and reports, as well as the congressional acts requiring them, looked to the utilization of appellant's Sanitary and Ship Canal, its adjuncts and the attendant diversion for a waterway, and also to the making of provisions for the restoration of lake levels by compensating works. (Statement, p. 34.)

The appellant expended upwards of seventy-five millions of dollars on the faith of the acquiescence in and the invitation extended for the building of the Sanitary and Ship Canal and its various adjuncts.

In

United States v. *Pennsylvania & Lake Erie Dock Company*, 272 Fed. 839, (C. C. A. Sixth Circuit), action of ejectment was brought by the United States to recover possession of a strip of land used as a pier by the defendant company. The Court found as facts: (*a*) That the government in the exercise of its paramount power over navigation had, in 1827, constructed a pier on part of the territory now in controversy; (*b*) That up to 1838, the government did expend money upon the maintenance of the pier; (*c*) That after 1838, the government did not expend any money upon the maintenance and repair of the south portion of the pier; (*d*) That the defendant company made application to the War Department for permission to encroach on the harbor line at the points indicated on a map submitted with the application; (*e*) That no objection and no claim was at that time made by the government to the submerged land; (*f*) That the defendant company made large expenditures for the concrete dock.

THE COURT HELD: That the evidence sustained the findings of the lower court; that the government had abandoned by failure and neglect, its right to the property in controversy saying:

> (848) "Regardless of whether the change in harbor lines was to be north or south of Second Street, the application and accompanying map fully informed the plaintiff of the purpose of the defendant to construct this concrete dock 15 feet wide upon this particular location. If the government then made any claim whatever to this property, it should then have asserted that claim, instead of delaying until after this defendant had expended large sums of money in the construction of this concrete dock; but it did nothing of the kind. On the contrary, it not merely passively, but by granting this permission for a change of harbor line, it actually, consented to the construction of this dock. It not only made no claims to this property at that time, but by its action induced the defendant to believe that it had no such claim, and that it had abandoned the exercise of its dominant power to construct and maintain a pier at this location.

The War Department was, by the Act of June 13, 1902, clothed with full authority to determine whether it would or would not maintain a pier along this portion of the water front, and it would seem that by this act alone, if by no other, the government must be held to have abandoned this particular site, or at least to have estopped itself from now claiming that it had not done so.

* * *

"In the case of *United States* v. *Stinson*, 197 U. S. 200-204, 25 Sup. Ct. 426, 49 L. Ed. 724, the Supreme Court held that, 'while laches or limitations do not of themselves constitute a distinct defense as against an action by the United States to assert a right in property,' nevertheless it affirmed the judgment of the lower court in that case, which judgment was based upon the declaration that 'the substantial consideration underlying the doctrine of estoppel applies to the government as well as to individuals.' Applying this doctrine to the facts of this case, in connection with the presumption that the United States government intended to act fairly in its dealings with its citizens, the finding of the trial court that the plaintiff had abandoned this part of the east pier and the location upon which it rested is sustained by competent evidence."

United States v. *Board of Commissioners of Osage County*, 254 Fed. 570, 573.

United States v. *Debell*, 227 Fed. 775, 779 (C. C. A., 8th Circuit).

United States v. *Midway Northern Oil Company*, 232 Fed. 619, 631.

The above cited cases enunciated the principle that

"It derogates from the dignity and character of the government to suppose that, formed as it is to secure impartial justice between individuals, it may nevertheless, in the conduct of its own affairs, without regard to the principles it represents, perpetrate upon its citizens wrongs which it would promptly condemn if practiced by one of them upon another."

United States v. *Chandler-Dunbar W. P. Co.*, 152 Fed. 41, 81.

In

Monongahela Navigation Company v. *United States*, 148 U. S. 312,

which was a proceeding by the government to condemn certain lands, the Court said (p. 334):

"* * * in this case there was not only the full authority of the State of Pennsylvania, but also so far as respects this particular lock and dam they were constructed at the instance and *implied invitation of Congress.* The Act of March 3rd, 1881, making appropriations for the improvement of the river in terms provided that no such improvement should be made until the * * * company had in good faith started upon the building of this lock and dam. * * * This is something more than the mere recognition of an existing fact; it *is an invitation to the company to do the work; and when in pursuance of that* invitation, and under authority given by the State of Pennsylvania, the company has constructed the lock and dam, it does not lie in the power of the state or *the United States to say that such lock and dam are an obstruction and wrongfully there,* * * *."*

In

Hemmer v. *United States*, 204 Fed. 898 (8th C. C. A.),

a suit was instituted by the United States for the purpose of setting aside certain conveyances which had been made under the Indian Homestead Law on the ground that a statute passed subsequently to the one under which the original homesteader had acquired his land had prolonged the restriction of alienation to twenty-five years, though it had been but five years before the passage of the Act. At page 901 the Court said:

"This is a suit in equity. In such a suit the claims of the government appeal to the conscience of the chancellor with no greater or less force than those of a private individual under similar circumstances. (Citing cases.)"

In

State of Iowa v. *Carr*, 191 Fed. 257 (8th C. C. A.),

there was an appeal by defendants in a suit to quiet title to a certain piece of land which had formed in a river. The

facts showed that complainant had occupied the land for a long period of time and had made improvements and paid taxes thereon without objection from either the state or the other complainants. At page 266 the Court said:

> "The equitable claims of a state or of the United States appeal to the conscience of a Chancellor with the same, but with no greater or less force than would those of an individual under the circumstances. (Citing cases.)"

The improvement of the critical points of navigation in the Great Lakes was fixed six inches lower by reason of the Chicago diversion. This improvement is known as the "1903 project" (Appellant's Narrative, p. 155). The table (Appellant's Narrative, p. 162) shows the project depths of the various improvements in the channels and harbors, where sail the large ore-carrying boats which claim to have been affected in their carrying capacities. This table also shows the actual depths of water which obtained up to the year 1922, at low water times. An examination of this table demonstrates that at no time was the depth of water less than the project depths. In fixing the reference plane lower for these various improvements because of the Chicago diversion, the Government accepted it as an existing fact, and Congress thereby not only acquiesced, but actually consented to the diversion and whatever effect it might have upon the lakes. It will be remembered that on August 16, 1895, the Board of Engineers reported to the Secretary of War on the subject of the effect of the diversion of 10,000 seconds feet, and in 1898 to 1900 deductions were made by the Lake Survey of the United States as to the effect of this lowering. The report of 1895, and the deductions made by the United States Lake Survey indicated that the effect on Michigan and Huron would be approximately six inches.

Appellant excavated the channels of the Chicago River and its branches to provide for a diversion of 10,000 seconds feet through them to its Sanitary and Ship Canal. If it were not going to abstract more than 4,167 seconds feet, all this work

was unnecessary. It also built, on the faith of the permits of July 11, 1900, for the excavation in said channels, intercepting sewers, North Shore and Calumet Sag Channels, pumping stations and other works. On the principle of the cases cited, appellee cannot now be heard to say that appellant has not the right. No intimation was given to appellant that the right was denied until after the work was done. The purpose of this expenditure was well known to appellee.

The force and effect of the treaty between the United States and Great Britain of January 11, 1909, relating to Canadian boundary waters and the reports of the International Waterways Commission recommending its terms.

As before stated, the International Waterways Commission, in its reports of May 3, 1906 (Appellant's Narrative, p. 104), and January 4, 1907 (Appellant's Narrative, p. 505), found and recommended that there should be allowed at Chicago a diversion from the Great Lakes system, at least 10,000 cubic seconds feet of water. In dividing the water for diversion at Niagara Falls for power purposes between the United States and Canada, the United States was charged with the 10,000 seconds feet Chicago diversion. In other words, it was agreed that Canada might, under the treaty, divert some 16,000 seconds feet at Niagara Falls more than the United States, because of this Chicago diversion. When the treaty was made, the right to divert this water by appellant and the State of Illinois was recognized. That right was not in any respect curbed. The treaty expressly eliminates from its terms by the preliminary article, Lake Michigan, as follows:

> "For the purposes of this Treaty boundary waters are defined as the waters from main shore to main shore of the lakes and rivers and connecting waterways, or the portions thereof, along which the international boundary between the United States and the Dominion of Canada passes, including all bays, arms, and inlets thereof, but not including *tributary waters which in their natural channels would flow into such lakes, rivers, and*

waterways, or waters flowing from such lakes, rivers and waterways, or the waters of rivers flowing across the boundary."

Obviously, Lake Michigan is not a boundary water, as defined by the Treaty.

Article II of the Treaty reserves to each of the parties, or to the state governments, or provincial governments, as the case may be, all rights over these nonboundary waters, as follows:

> "Each of the High Contracting Parties reserves to itself, or to the several State Governments, on the one side, and the Dominion or Provincial Governments on the other, as the case may be, subject to any Treaty provisions now existing with respect thereto, the exclusive jurisdiction and control over the use and diversion, whether temporary or permanent, of all waters on its own side of the line which in their natural channels would flow across boundary or into boundary waters; but it is agreed that any interference with or diversion from their natural channels of such waters, on either side of the boundary resulting in any injury on the other side of the boundary, shall give rise to the same rights and entitle the injured parties to the same legal remedies as if such injury took place in the country where such diversion or interference occurs; but this provision shall not apply to cases already existing, or to cases expressly covered by special agreement between the parties hereto.
>
> It is understood, however, that neither of the High Contracting Parties intends by the foregoing provision to surrender any right which it may have to object to any interference with or diversions of waters on the other side of the boundary, the effect of which would be productive of material injury to the navigation interests on its own side of the boundary." (Appellant's Narrative, p. 531.)

And again in Article III it is stated:

> "* * * nor are such provisions intended to interfere with the ordinary use of such waters for domestic and sanitary purposes." (Appellant's Narrative, p. 532.)

Article VIII expressly provides that the uses for domestic and sanitary purposes shall be paramount. (Appellant's Narrative, p. 535.)

The Treaty thus completely protects the diversion at Chicago. There was no dispute between the United States and the Dominion of Canada as to the right to divert 10,000 cubic seconds feet of water from Lake Michigan at Chicago. The International Waterways Commission, which was composed of representatives of the two governments, settled that. The two reports mentioned, those of May 3, 1906, and January 4, 1907, were signed by all the members of the Commission—three from the United States and three from Canada. As to the diversion at Chicago, the only question remaining unsettled was whether there should be diverted by the State of Illinois and appellant, at Chicago, more than 10,000 cubic seconds feet of water. The purpose is stated, in the treaty itself, to be—

> "* * * *to settle all questions which are now pending* between the United States and the Dominion of Canada involving the rights, obligations or interests of either in relation to the other or to the inhabitants of the other along their common frontier, * * *"

Article II thus left unhampered the power of the sovereign over the waters that were not boundary waters within the sovereign's territory, subject only—

(1) to the right of the citizens of one country to sue in the courts of the other country for damages as to any caused by a diversion not then existing;

(2) to the right merely of either party to object to further diversions than those which existed, the effect of which diversions would injure navigation.

The Chicago diversion to the amount of 10,000 seconds feet was found by International Waterways Commission to be an existing diversion, as follows:

> "It (the Commission) does not desire an investigation of the effect upon the navigation interests of the Great Lakes. It has satisfied itself upon that point. Nor does it wish to reopen the case of the Chicago Drainage Canal as designed in the bill. It accepts that as a fixed fact, with its attendant diversion of 10,000 cubic feet per second through the Chicago River." (Appellant's Narrative, p. 522.)

The right to the sovereign having jurisdiction over Lake Michigan, a non-boundary water, subject to the conditions mentioned, was thus reserved. As to those waters, the sovereign could do anything with them it chose.

In

The Schooner Exchange v. *McFaddon*, 7 Cranch 116,

Chief Justice Marshall stated the rule to be (p. 136):

> "The jurisdiction of the nation within its own territory is necessarily exclusive and absolute. It is susceptible of no limination not imposed by itself. Any restriction upon it, deriving validity from an external source, would imply a diminution of its sovereignty to the extent of the restriction, and an investment of that sovereignty to the same extent in that power which could impose such restriction.
>
> All exceptions, therefore, to the full and complete power of a nation within its own territories, must be traced up to the consent of the nation itself. They can flow from no other legitimate source."

See also opinion of Judson Harmon on right of United States in Rio Grande, 21 Opin. Atty. Gen. 274, 280.

This we understand is the accepted rule of international law and is recognized by the treaty.

The waters which are diverted from Lake Michigan at Chicago are wholly within the limits of the State of Illinois. The boundary line of the State extends due north into Lake Michigan from the intersection of the shore of the Lake with the boundary between Indiana and Illinois to a point where it is met by the boudary line between Wisconsin and Illinois extended due East.

The treaty between the United States and Great Britain, of 1909, ratified by the Senate is the law of the land, and may properly be said to have been made, so far as the Chicago diversion is concerned, for the benefit of the State of Illinois and the appellant. Such being the case, the State or appellant may compel the recognition of such contract right. The Treaty reserved the right of the sovereign—and the state is

a complete sovereign except as to those things delegated to the Federal Government—over these waters. Article II begins—

> "Each of the high contracting parties reserves to itself, or to the several State Governments—"

the right of the sovereign over the nonboundary waters. There was thus recognized the right of the state government as a sovereign to divert or use non-boundary waters. This construction is borne out by the provisions of Article V of the Treaty relating to the diversions at Niagara Falls, wherein it is provided:

> "The United States may authorize and permit the diversion within the State of New York of the waters of the said river above the Falls of Niagara, for power purposes, not exceeding in the aggregate a daily diversion at the rate of 20,000 cubic feet of water per second."

The Niagara River at this point is an international stream and a boundary water, and the makers of the Treaty took this fact into consideration and made it a condition of the diversions at Niagara Falls that the *United States itself* should *first* "authorize and permit" them.

At least the United States, by making the Treaty, must be construed to have acquiesced and consented to the conditions of the diversions as they existed at the time it was made, unless some definite action were taken by Congress indicating a different intention. Not only has Congress not indicated any such contrary desire, but, on the other hand, has taken action June 25, 1910, and June 30, 1917 looking towards making provision for the maintenance of the surface elevations of the lakes, as they would be if the diversions did not exist. This includes not only the Chicago diversion for sanitary purposes, but all other diversions, even for navigation and power purposes. Of course, Canada is not in a position to even object to the diversion to the amount of 10,000 seconds feet at Chicago.

VI.

THE DECREE OF THE LOWER COURT IS BASED SOLELY UPON THE TESTIMONY OF EXPERT WITNESSES. NO WITNESS WAS PRODUCED BY APPELLEE TO TESTIFY THAT THE LOWERING OF THE LAKE SURFACES OR DAMAGE TO COMMERCE, WAS EVER ACTUALLY OBSERVED. APPELLEE'S CASE DEPENDS ENTIRELY UPON AN INFERENCE OF THE UNSEEN AND THE SUBTLE ANALYSES OF EXPERT WITNESSES, WHICH CANNOT FORM THE BASIS OF AN INJUNCTIONAL DECREE.

(a) Expert evidence in injunction cases.

In the statement (p. 64) we have set forth the method by which appellee's expert witnesses sought to establish the basis for this injunction. Measurements were made of the discharge at different times of the outlet rivers of the different lakes, such as Huron, Erie and Ontario. The discharge measurements were plotted and by means of these plottings an increment, that is the increase or decrease of the flow of the outlet river due to one foot of change of the surface elevation of the controlling lake, was sought to be deduced. It was then assumed that the Chicago diversion would have a lowering effect upon the lake surface due to the fraction of a foot resultant from dividing the amount of the diversion by the increment. But the determination of this increment depended upon the accuracy of many things done and upon the correctness of the premises upon which the conclusion was based. In these plottings a discharge measurement made at a certain time in an outlet river many miles below the lake's outlet, depended upon whether the particular discharge was referred to the correct elevation of the lake. A time interval was assumed so that if, say, a particular discharge measurement was made at 11:00 o'clock upon a certain day, it was assumed that 10, 15, 20 or 25 minutes prior to that time, the surface elevation of the lake as appeared by the

recording gauge influenced that particular discharge measurement. The fixing of the time interval was based upon conjecture. It was found that the government witnesses as to the time necessary to create a change of flow throughout the Drainage Canal, were entirely wrong, as the tests showed. The result of these tests was never questioned. Also, it appears that the surface elevation of the lakes is constantly changing as much as six inches to several feet in a few minutes or hours. But no one testified to observing any lowering effect. On the contrary, it appeared that the mean elevation of the different lakes involved for the ten years immediately subsequent to the opening of the Drainage Channel, was higher than the mean for the ten years immediately preceding.

The next steps in appellee's program for the determination and showing of injury to navigation and commerce, was to assume that the lake surfaces would be thus lowered by 5 to 6 inches for Huron and Michigan for 10,000 seconds feet diversion, and in smaller amounts for Erie and Ontario, and that certain boats navigating the Great Lakes would be deprived of that number of inches of draft. Of course, on appellee's own theory the total number of inches of lowering the surface elevation of Lake Michigan, here involved, cannot be over three inches. They admit appellant has the right to divert 4,167 seconds feet. So the effect upon the lake surface of the difference between that amount and 10,000 seconds feet is the one to be considered here. It was estimated that for each inch of lowering, there would be a loss of 80 to 100 tons in the amount a vessel affected would carry each trip. But there were a number of difficulties in reaching this result, even if the first assumption were correct as to the reduction in surface elevations of the lakes. No one testified to observing a loss in the amount the boats actually carried. The expert witnesses concluded that they would be deprived for each trip of the amount mentioned. But it appeared that boats could not load within such narrow limits as the few inches involved. The lakes were changing, as

stated, constantly. Lake Erie would change sometimes as much as 8 feet in a few hours. Lake Michigan and Huron almost as much. A perusal of the hydrograph of the Great Lakes (Appellant's Narrative, p. 125) shows continuous yearly fluctuations of a foot or more. The hourly readings, as shown by the plat attached to the report of the Board of Engineers on Waterway from Utica to the Mouth of the Illinois River (Appellant's Narrative, p. 150), shows these oscillations due to barometric pressure or seiches. Further, the evidence showed that the channels traversed by boats should be of a depth so that there would be at least two feet of water beneath them. (Appellant's Narrative, p. 150.) A few inches, such as involved here, is of no importance.

So we find that appellee's evidence starts with the conclusion of expert witnesses and goes no further and ends with the request that, upon such conclusions and an inference of the unseen, the injunctive relief should be ganted.

In

Missouri v. *Illinois*, 200 U. S. 496, 523,

this Court recognised the principle that injunctive relief would not be granted upon this sort of evidence. The question involved there was whether the sewage discharged by appellant into the Illinois River, carried disease to the Mississippi River, the water supply of St. Louis. Plaintiff's witnesses in that case were experts, and it was upon their conclusions that the injunction was sought. This Court, in stating the reliance to be placed upon this kind of evidence, said:

> "There is nothing which can be deducted by the unassisted senses,—no visible increase of filth, no new smell. * * * The plaintiff's case depends upon an inference of the unseen. * * * The experts differ as to the time and distance within which a stream would purify itself. No case of an epidemic caused by an infection at so remote a source, is brought forward, and the cases which are produced are controverted."

This case was cited and the opinion quoted in full in

Joyce on Nuisances, 1906 Ed., Sec. 299.

The same author, at Section 420, states the rule—

"The nuisance must be actual and existing and not future, however strongly the apprehension of injury may be supported by scientific evidence."

In

Salvin v. *North Brancepeth Coal Company*, L. R. 9, Chanc. Appeals, 705,

a bill was filed to prevent the Colliery Company from erecting or using any coke ovens or other ovens to the nuisance of the plaintiff, the nuisance alleged being from smoke and deleterious vapors. Sir William M. James, in rendering his opinion, said:

(709) "When the Masters of the Rolls said that the damage must be visible, it appears to me that he was quite right; and, as I understand the proposition, it amounts to this, that, although when you once establish the fact of actual substantial damage it is quite right and legitimate to have recourse to scientific evidence as to the causes of that damage, still if you are obliged to start with scientific evidence, such as the microscope of the naturalist, or the tests of the chemist, for the purposes of establishing the damage itself, that evidence will not suffice. The damage must be such as can be shown by a plain witness to a plain common juryman.

The damage must also be substantial, and it must be, in my view, actual; that is to say, the Court has, in dealing with questions of this kind, no right to take into account contingent, prospective, or remote damage. I would illustrate this by analogy. The law does not take notice of the imperceptible accretions to a river bank or to the seashore, although after the lapse of years they become perfectly measurable and ascertainable; and if, in the course of nature, the thing itself is so imperceptible, so slow, and so gradual as to rquire a great lapse of time before the results are made palpable to the ordinary senses of mankind, the law disregards that kind of imperceptible operation. So, if it were made out that every minute a millionth of a grain of poison were absorbed by a tree, or a millionth of a grain of dust deposited upon a tree, that would not afford a ground for interfering, although after the lapse of a million minutes the grains of poison or the grains of dust could be easily detected."

See also

North Dakota v. *Minnesota,* 68 Law. Ed. 159 (Advance sheets Jan. 1, 1924).

Commerce upon the Great Lakes has gone on apparently unimpeded, and each year has shown an increase in the amount of tonnage carried by boats. In fact, all the great ore carrying vessels claimed to be damaged, have been built since the Drainage Canal was opened.

(b) Disregarding all questions heretofore presented as to the right of appellant to operate its works with the diversion required, nevertheless the injunction decree should not have been entered unless the injury and damage to commerce was material and the obstruction to navigation was unreasonable.

In

United States v. *Rio Grande Irrigation Company,* 174 U. S. 690,

a bill was filed to restrain the construction of a dam across the Rio Grande River in that portion of the river in New Mexico which was not navigable. It was claimed that this dam would impound the waters in such manner that it would affect the navigable capacity of the Rio Grande River lower down in its navigable portions. The Court refused the injunction. This Court held that it was necessary for the Government to show a substantial interference with navigation, and said (709):

> "• • • it becomes a question of fact whether the act sought to be enjoined is one which fairly and directly tends to obstruct (that is, interfere with or diminish the navigable capacity of a stream) • • • The question always is one of fact, whether such appropriation substantially interferes with the navigable capacity within the limits where navigation is a recognized fact."

This Court ordered:

> "• • • an inquiry into the question whether the intended acts of the defendants in the construction of a dam and

in appropriating the water of the Rio Grande will substantially diminish the navigability of that stream within the limits of present navigability, * * *"

Corrigan Transit Company v. *Sanitary District*, 137 Fed. 851, 857.

Lake Shore & Michigan Southern Railway Company v. *Ohio*, 173 U. S. 285, 294.

Cummings v. *Chicago*, 188 U. S. 410, 428.

Union Bridge Company v. *U. S.*, 204 U. S. 364, 365, 385, 400.

The above cases show that the only things with which the courts are concerned, in protecting navigable waterways of the United States, are unreasonable obstructions.

(c) It must appear in a case of this character, considering the parties involved, that an unreasonable obstruction and damage to commerce clearly exist before an injunction will issue.

In the recent case of

New York v. *State of New Jersey & Passaic Valley Sewage Commissioners*, 256 U. S. 296,

where New York instituted suit to enjoin the defendants from discharging sewage into New York Bay, injuring navigation thereon, this Court said (p. 309):

"With the record in this state we come to consider the evidence introduced, but subject to the rule that the burden upon the State of New York of sustaining the allegations of its bill is much greater than that imposed upon a complainant in an ordinary suit between private parties."

In

Kansas v. *Colorado*, 206 U. S. 46,

Kansas brought sought to enjoin Colorado from diverting the waters of the Arkansas River for irrigation purposes. It was claimed that this diversion seriously injured the people

of Kansas, and that Colorado had no right to such diversion. This Court, in summing up its conclusions, stated (p. 117):

> "* * * that the result of that appropriation has been the reclamation of large areas in Colorado, transforming thousands of acres into fertile fields, and rendering possible their occupation and cultivation when otherwise they would have continued barren and unoccupied; that while the influence of such diminution has been of perceptible injury to portions of the Arkansas Valley in Kansas, particularly those portions closest to the Colorado line, yet, to the great body of the valley it has worked little, if any, detriment, and regarding the interests of both States, and the right of each to receive benefit through irrigation and in any other manner from the waters of this stream, we are not satisfied that Kansas has made out a case entitling it to a decree."

See also

Attorney General v. *Mayor, Alderman and Corporation of Kingston-on-Thames,* 13th Weekly Reporter, 1863-1865, 888.

In

Mississippi & Missouri R. R. Co. v. *Ward,* 2 Black 485,

Ward charged the railroad with having created a nuisance by erecting a bridge across the Mississippi River at Rock Island, and prayed that it be abated as a nuisance (p. 495):

> "Then again, the obstruction to navigation must be plainly a nuisance within this rule before it can be removed by decree. If the proceeding was by indictment, and the jury doubted whether the obstruction was a nuisance or not, they would be instructed to acquit the defendant; and so, if this case was referred to a jury to try the fact and they doubted, they would be bound to acquit. And the same rule applies in a court of chancery where the Court ascertains the fact of nuisance. 2 Story, Com. on Eq., 203, 204."

VII.

A COURT OF EQUITY IN DETERMINING WHETHER OR NOT IT WILL GRANT AN INJUNCTION LOOKS NOT ONLY TO THE NAKED LEGAL RIGHTS OF THE COMPLAINANT AND THE ADVANTAGES TO BE BY IT GAINED, BUT ALSO TO THE INCONVENIENCES AND INJURIES TO BE SUSTAINED BY THE DEFENDANT. AND IF IT APPEARS THAT THE GRANTING OF THE INJUNCTION WOULD CAUSE COMPARATIVELY GREATER INJURY TO THE DEFENDANT THAN IT WOULD CAUSE BENEFIT TO THE COMPLAINANT, A COURT OF EQUITY WILL NOT HESITATE TO DENY THE RELIEF.

The above proposition is the rule in suits for injunctions between private persons. Where the parties are public bodies and represent the interests of the public, the Court should be meticulous in observing the rule and especially where the great question of the protection of the public health is involved. Here, as is shown by the undisputed facts, the injunction can have but one result—the immediate pollution of the only water supply for Chicago. If all the artificial purification and filtration works that could be installed, at a time in the future impossible now to determine were now in existence, still with the limitation of withdrawal to 4,167 cubic seconds feet, or materially less than 10,000 seconds feet, the Lake Michigan water supply would be polluted. There is no means by which, with such purification works in existence, an effluent from them can be prevented from finding its way at numerous times during the year into Lake Michigan. This effluent would carry disease germs. This results from the fact that the Chicago River and its branches cannot be kept reversed at all times unless there is allowed a continuous flow through them of at least 10,000 cubic seconds feet of water. This flow of water cannot be obtained except from Lake Michigan. In 1914, when the tests were made, it

was found that the volume of flow through the drainage channel and the Chicago River and its branches to the lake could not be increased from 4,167 seconds feet to 10,000 seconds feet, the maximum drainage run-off, within a period of less than twenty-four hours. This would be too late. The water would pile up in the channels of the river in from three to four hours in case of storm on this area and would flow into the lake carrying the sewage pollution. (Appellant's Narrative, p. 390.) The frequency of such occurrences increases and the danger to the water supply is more imminent as the paved and sewered area of the Chicago River basin is extended. That would be the condition even if Chicago and its environs had now installed these vast sewage and water purification works. How much more aggravated would the condition be with practically none of the sewage purified. The result of this decree would be the immediate cutting down of the flow from 10,000 cubic seconds feet, which now exists, to the limited flow of 4,167 seconds feet. The condition of nuisance in the Chicago, DesPlaines and Illinois Rivers would be intolerable. Lake Michigan would be polluted. Typhoid fever would exist and ever increasing epidemics would follow.

10,000 cubic seconds feet diversion from Lake Michigan will dilute the sewage of 3,000,000 people; 12,000 cubic seconds feet 3,600,000 people; and 14,000 cubic seconds feet 4,200,000 people. The cost of artificially treating the sewage of the difference between that population which would be oxidized by 4,167 cubic seconds feet of diversion and that population that would be oxidized by 10,000 cubic seconds feet is $183,510,507.00. The cost of artificially treating the sewage of the difference between that population which would be oxidized by 4,167 cubic seconds feet of diversion and that population which would be oxidized by 12,000 cubic seconds feet in $220,141,100.00. And the cost of artificially treating the sewage of the difference between that population which would be oxidized by 4,167 cubic seconds feet of diversion and that by 14,000 cubic seconds feet would be $256,958,800.00. (Appellant's Narrative, p. 217.) This would leave still untreated the

sewage that would be oxidized by 4,167 cubic seconds feet, which sewage would have to be treated if the diversion were limited to that amount, so that no raw sewage would go into Lake Michigan. The cost of sewage purification works to take care of this amount must also be added, which would be approximately $75,000,000.00. First, however, the wastes and the sewage from the increase of population in the period ending with the year 1945 must be treated. The resources of appellant will not permit this before the year 1945. The cost is upwards of one hundred million dollars. A like sum would have to be expended for water filtration plants, also, by the cities and towns furnishing water to the consumer. (Statement, p. 79.) And we would not then have a situation as to the water supply, approaching the conditions that prevail today, with all the sewage and drainage kept away from Lake Michigan. In such instance an effluent from these purification works would be discharged, at times, into the lake. Instead of Chicago having an unpolluted water supply, it would then have a polluted one, with constant danger of epidemics of typhoid fever and other water-borne diseases.

On the other hand, the benefit of this injunction to the appellee or to commerce on the Great Lakes, as has been heretofore stated, is problematical. Granting all that appellee claims, it is slight compared with the inconvenience, money expenditure, damage, danger to health and creation of nuisances that would result to appellant upon the enforcement of the injunction in any form.

In

Volume 1, Joyce on Injunctions, Sec. 20, p. 41,

it is said:

> "And an injunction will not be granted when the injury complained of is slight compared to the inconvenience to the defendant and the public that would result from granting the injunction."

Again at Sec. 25, p. 50:

> "Where the rights of the parties are at all doubtful the court applied to for an injunction should look at the

balance of convenience, and act upon the consideration of the comparative inconvenience which may arise from granting or withholding the injunction."

In

Kansas v. *Colorado*, 206 U. S. 46, 117,

this Court recognized the principle stated.

In

Georgia v. *Tennessee Copper Co.*, 206 U. S. 230,

a suit was instituted by the State of Georgia against a corporation, a citizen of the State of Tennessee, to enjoin the discharge of noxious gasses from their works in Tennessee over large tracts of territory in Georgia. The Court recognized the principle for which we contend, and, in speaking of the character of the action of the State in seeking the injunction, said (p. 237):

"It has the last word as to whether its mountains shall be stripped of their forests and its inhabitants shall breathe pure air."

The Court, in granting the injunction, did so reluctantly, because it would have the effect of very seriously injuring the defendant's works. It was recognized that where the public health of the people of the State of Georgia was so directly involved, the different equities of the defendant would not be so carefully weighed. The converse, of course, of that must follow. Here the protection of the health of the people residing within appellant's limits is concerned—almost half of the population of the State of Illinois. On the other side, there is only the question of possible, remote or, at most, indirect damage to commerce.

This rule was recognized also in

Dun v. *Lumbermen's Credit Assn.*, 209 U. S. 20.

In

McCarthy v. *Bunker Hill & Sullivan Mining & Concentrating Co.*, (C. C. A. 9th Circuit), 164 Fed. 927,

a suit was instituted to enjoin the mining company from discharging its tailings into a stream. It appeared that the

benefit to the plaintiff would be slight, and that the damage to the defendants and its employees would be great. The Court said (940):

> "To an injunction, however, even on final hearing, no one has an absolute and unqualified right. Such an application appeals to the conscience of the chancellor, to the exercise of a wise and sound discretion, and should be granted or withheld according to the equities of the case as made to appear by the record. Each case must be considered and made to depend upon its own particular facts and circumstances, in the consideration and determination of which the general rules governing courts of equity are to be borne in mind and applied."

In

City of New York v. *Pine*, 185 U. S. 93,

suit was instituted to enjoin the City of New York from maintaining a dam on the West branch of the Byram River and diverting the waters from their natural flow through the plaintiff's farms. This Court assumed, as was found by the lower court, that the plaintiffs would suffer substantial damage and, besides, that they have the legal right to the natural flow. It was held that the decree enjoining the City of New York should not be sustained because of the damage that would result thereby to that city, and considered the greater equities in the City of New York (p. 97):

> "* * * *a municipality undertaking a large work with a view of supplying many of its citizens with one of the necessities of life.*"—

namely, a pure water supply.

VIII.

THE STATEMENT MADE BY THE SECRETARY OF WAR (JANUARY 8, 1913) IN REFUSING TO REMOVE THE ALLEGED LIMITATION BY THE ORDER OF DECEMBER 5, 1901 (4167 SECONDS FEET WITHDRAWAL) AND DENYING EXPRESS AUTHORITY TO APPELLANT TO DIVERT 10,000 CUBIC SECONDS FEET, IS IMMATERIAL. THE STATUTE DOES NOT AUTHORIZE ANY FINDINGS OR CONCLUSIONS BY THE SECRETARY OF WAR. IF IT DID, THE CONCLUSIONS WOULD BE SUBJECT TO REVIEW. IN ANY EVENT, THE CONCLUSIONS OF FACT AND OF LAW STATED, ARE ERRONEOUS, AS APPEARS BY THE RECORD OF THE CASE.

(a) The statute does not authorize the Secretary to make any findings or conclusions. If it did, such would be subject to review.

It will be recalled that on February 5, 1912, appellant asked that the limitation of the December 5, 1901 order be removed. At that time appellant had completed the work of excavating, expressly authorized by the Secretary of War and recommended by the Chief of Engineers under the July 11, 1900 permits, whereby the channels of the Chicago River and its branches had been deepened and widened, so that they would properly permit a flow of water through them equal to 10,000 cubic seconds feet. Appellant then had complete authority for the diversion to that amount, as we have showed. A limitation placed upon the withdrawal at a time before appellant had completed the excavation in the channels of these rivers had no force or effect. However, as the limitation remained unchanged, notwithstanding the work thereafter done, it was the desire, of course, of appellant to have this apparent conflict removed. It thus made its application for the removal of the limitation on the assurance, justified, that the Secretary of War would remove it as a matter of course. No

other course in keeping with fair dealing could follow, after appellant had, in good faith, deepened and widened the channels of the Chicago River and its branches, at an expense of upwards of $10,000,000, to accomplish this purpose. And it must be well considered that it was unnecessary for appellant to do this work, except for the withdrawal of more than 4,167 seconds feet and up to 10,000 seconds feets. It had fruther constructed adjuncts and other works in reliance upon its right to take from Lake Michigan for sanitary purposes, the larger quantity.

Neither Section 9 nor Section 10 of the March 3, 1899 Act, under which the Secretary of War sought to act, authorizes that official to make findings or conclusions in refusing or granting a permit or authorizing work to be done. Neither is there any provision for findings and conclusions of the Chief of Engineers in refusing to recommend or in recommending as to those things by said sections provided.

Section 18 of the Act of March 3, 1899, with a reference to the altering of bridges, expressly provides for a hearing and findings to be made by the Secreary of War. *Inclusio unius, exclusio alterius.* If Congress had intended conclusions and findings to be made, it would have so stated with reference to the subjects for the Secretary of War to act upon, mentioned in Sections 9 and 10.

If it may be construed that the Secretary of War had authority to make findings and conclusions, they are subject to review.

In

Philadelphia Company v. *Stimson*, 223 U. S. 605,

suit was brought to set aside certain harbor lines, and to restrain the Secretary of War from causing criminal proceedings to be instituted against the company because of the reclamation and occupation of land outside the prescribed limits. This Court said (p. 620):

> "In case of an injury threatened by his illegal action, the officer cannot claim immunity from injunction proc-

ess. The principle has frequently been applied with respect to state officers seeking to enforce unconstitutional enactments.

* * *

And it is equally applicable to a federal officer acting in excess of his authority or under a power not validly conferred."

See also

Hardin v. *Jordan*, 140 U. S. 371.

Rosenberger v. *Harris*, 136 Fed. 1001, 1002.

United States v. *United Verde Copper Company*, 196 U. S. 207, 215.

School of Magnetic Healing v. *McAnnulty*, 187 U. S. 94.

In the latter case, the Court had under consideration the act of the Postmaster General in regard to the delivery of the mails, in which a decision by him was made. This Court said (p. 110):

"Yet such decision, being a legal error, does not bind the courts."

(b) In any event, Secretary of War Stimson's findings and conclusions were erroneous.

In speaking of Secretary of War Alger's permit of May 8, 1899, Secretary of War Stimson said:

"He permitted a flowage of 5,000 cubic feet per second." (Appellant's Narrative, p. 28.)

The fact is, as clearly shown, the capacity of the Sanitary and Ship Canal as built prior to the May 8, 1899 permit, and as fixed by law, was not less than 10,000 cubic seconds feet. Many officers of appellee had so found, and there is no dispute about this. However, the permit recited that the channels of the Chicago River and its branches had been widened and deepened so that 5,000 cubic second feet of water could be taken through them without creating a current greater than one and one-fourth miles per hour. This was merely a recital.

The granting clause of the permit authorized, as recommended by the Chief of Engineers, the opening and operation of the channel to its full capacity subject to only the two principal conditions mentioned, namely (1), Congressional action; (2), if a current in the Chicago River should be obstructive to navigation thereon, the Secretary of War might modify the amount of the discharge.

In

Corrigan Transit Company v. *Sanitary District*, 137 Fed. 851,

the Circuit Court of Appeals of the Seventh Circuit construed the effect of this very permit of May 8, 1899, and held that the preambles did not limit the granting clause, as the granting clause was unambiguous. In that case, it was claimed that the rate of flow of one and one-fourth miles per hour, was a condition or a limitation upon the amount of the withdrawal. The Court said (p. 855):

> "In the grant of permission no reference to rate is found. The only reference is in the second clause of the preamble to the grant. But a preamble cannot be resorted to except to help solve an ambiguity in the body of the grant or enactment. The grant here is unambiguous."

Again, the Secretary states, in his January 8, 1913 statement, that

> "the amount of the current permitted to be taken was modified or restricted until December 5, 1901, when it was fixed at the amount now permited, and these permits contained the condition—that the permission herein given shall be subject to such modification as in the opinion of the Secretary of War public interest may from time to time require."

The so-called permit of December 5, 1901, was an order of the Secretary of War to limit the flow under Condition 2 of the May 8, 1399 permit, with reference to an unreasonably obstructive current in the Chicago River. This December 5, 1901 order recites this Condition 2 and refers to other orders made under it. The words, "subject to such modification as

the public interest may from time to time require," cannot be construed to enlarge conditions of the May 8, 1899 permit.

The Secretary, by this January 8, 1913 statement, construed the March 2, 1827 Act as not authorizing the construction of the Sanitary and Ship Canal, or the diversion of water required for its operation. It stated that the Illinois and Michigan Canal,

> "derived its water for navigation purposes from the Calumet, Des Plaines and Chicago Rivers, and not from the Lakes",

and that the authorization and construction of the Illinois and Michigan Canal did not

> "offer the slightest congressional sanction for the great canal now under discussion which was not even contemplated until much more than a half century later." (Appellant's Narrative, p. 29.)

The holding of the Supreme Court of Illinois in *Mortell* v. *Clark*, 272 Ill. 201,

heretofore cited (this brief, p. 120) is absolutely contrary to the conclusion that the Sanitary and Ship Canal was not authorized under the congressional act mentioned.

The Act of January 9, 1836, of the Illinois General Assembly, under which the Illinois and Michigan Canal was constructed, provides for its being supplied with water from Lake Michigan, and for the reservation of ninety feet on each side for its enlargement. The width of the present Sanitary and Ship Canal is approximately the 180 feet thus reserved plus the then provided width of the Illinois and Michigan Canal, 45 feet, a total of 225 feet. This certainly gives some weight to the proposition that the parties intended (that is, Congress and Illinois) at that early day, in providing for this waterway, that at some time it should be of the size of the present Sanitary and Ship Canal, with the authority in Illinois to take such water from Lake Michigan as it considered necessary for the operation of such enlarged canal. The fallacy of the Secretary's statement is further heretofore demonstrated by us. (This Argument, p. 118.)

Secretary Stimson also found that Lakes Michigan and Huron's surfaces would be lowered by this diversion 6.9 inches. The evidence here of appellee places the lowering of Michigan and Huron at 5 inches. The Secretary also found correspondingly larger amounts for the effect of 10,000 seconds feet diversion upon Lake St. Clair, Lake Erie, Ontario and the St. Lawrence River and at Rapide Plat. He did not, however, make the statement that the possible lowering effect upon Lake Ontario was taken care of by the construction of the Gut Dam by the Canadian Government in 1903, as found by the Boad of Engineers on Waterway from Utica to the mouth of the Illinois River, appointed pursuant to the Act of Congress of June 25, 1910. (Appellant's Narrative, p. 176.)

The Secretary, in ascertaining the damage to commerce, followed the procedure of calculating a certain number of trips each season of the ore carrying vessels claimed to be affected and multiplied this by the amount per inch of claimed loss in cargo for each trip (100 tons per inch). He then multiplied the freight rate by the total claimed loss, and reached the result of many millions of dollars per year loss to commerce on the Great Lakes. The mere statement of the proposition shows its fallacy. This could not possibly be the loss, because there was only so much freight to carry by water on these boats so claimed to be affected. The loss necessarily could not be greater than the actual loss of carrying the volume of freight by these boats with the smaller tonnage.

The Secretary also concluded that it would be possible for appellant to get along with less than 10,000 seconds feet. In this, he absolutely overlooked the basic principle of the diversion for sanitary purposes—the reversal of the flow of the Chicago River at all times. 10,000 seconds feet is its minimum flowage. Without that continuous flow, the river would many times each year flow into Lake Michigan, carrying its pollution. There is no dispute upon this point.

The Secretary also concluded that objections of Canada to the 10,000 seconds feet diversion, was an obstacle in the way of the Secretary's acting upon the request of appellant. The treaty cannot be so construed.

The Secretary's construction of the force and effect of the case of

United States v. *Rio Grande Irrigation Company*, 174 U. S. 690,

was also error, as that case arose under a territorial act of New Mexico which is entirely different from the authority which appellant has under a reserve power of a *state*.

IX.

THE LOWER COURT SHOULD HAVE GRANTED THE MOTION OF JULY 12, 1920, BY APPELLANT, MADE FOLLOWING THE OPINION OF JUDGE LANDIS AND HIS DIRECTION AS TO THE DRAFTING OF A DECREE, THAT THE APPELLANT BE ONLY ENJOINED FROM TAKING IN EXCESS OF 10,000 CUBIC SECONDS FEET OF WATER FROM LAKE MICHIGAN ON CONDITION THAT APPELLANT PAY THE COST OF CONSTRUCTING SUCH COMPENSATING OR REGULATING WORKS AS THE UNITED STATES SHOULD PROVIDE TO BE BUILT TO OFF-SET FOR THE CLAIMED LOWERING OF THE LAKE SURFACES AND THEIR CONNECTING CHANNELS DUE TO 10,000 SECONDS FEET DIVERSION AT CHICAGO. ADMITTING, FOR THE SAKE OF ARGUMENT ONLY, ALL CONTENTIONS OF APPELLEE TO BE TRUE, APPELLANT CAN NOT BE ENJOINED FROM TAKING AN AMOUNT OF WATER MATERIALLY LESS THAN 10,000 CUBIC SECONDS FEET FROM LAKE MICHIGAN, UNTIL APPELLANT AND CITIES AND TOWNS WITHIN ITS LIMITS CAN, IF AT ALL, READJUST THEIR WORKS OF SEWAGE DISPOSAL AND OF PURIFICATION OF WATER SUPPLY TO SUIT THE CHANGED CONDITIONS.

(a) By granting the motion of appellant above mentioned, July 12, 1920, the lower court would have done equity. The construction of compensating or regulating works was entirely feasible, as the undisputed facts of the record show.

As grounds of the motion, it was alleged principally that the Board of Trustees of appellant had by ordinance on July 8, 1920, offered to pay the expense of constructing such regulating and compensating works as the United States might

determine to build to off-set for the claimed lowering of the surfaces of the Great Lakes and connecting channels, due to a diversion of 10,000 cubic seconds feet. The ordinance also authorized the attorneys for appellant to make such offer in this case. (Appellant's Narrative, p. 111.)

The motion alleged that the undisputed facts of the record, as has heretofore been pointed out in the statement (p. 77) and in Appellant's Narrative Statement showed that compensating or regulating works were feasible and would accomplish the end proposed. It will be recalled that the Board of Engineers on Waterway from Utica to the mouth of the Illinois River, recomended that contracting works be constructed in the St. Clair and Niagara Rivers, and found that Ontario did not require any such works to be constructed in the St. Lawrence, as the closure of the Gut Channel in the St. Lawrence had already off-set for any claimed lowering due to the 10,000 seconds feet diversion at Chicago. (Statement, p. 71.) It was alleged also that various witnesses and boards of engineers had likewise testified and found as to the feasibility of such compensating, contracting or regulating works, and that these facts were not disputed by appellee in this record. It was further pointed out in this motion that the Treaty of 1909 as to Canadian Boundary Waters, heretofore discussed (this brief, p. 78) contemplated that the United States might construct such contracting works. The estimate of the cost of these contracting works, according to the Board of Engineers on Waterway from Utica to the mouth of the Illinois River, as made in 1913, would not exceed $475,000 (Appellant's Narrative, p. 100) and they would entirely off-set for any claimed injury to commerce on the Great Lakes. (Appellant's Narrative, p. 101) And this amount, or any other that such works might cost, appellant offered to pay. (Appellant's Narrative, p. 111.)

Article 3 of the treaty is significant, as follows:

"ARTICLE 3.

It is agreed that, in addition to the uses, obstructions, and diversions heretofore permitted or hereafter pro-

vided for by special agreement between the Parties
2564 hereto, no further or other uses or obstructions or diversions, whether temporary or permanent, of boundary waters on either side of the line, affecting the natural level or flow of boundary waters on the other side of the line, shall be made except by authority of the United States or the Dominion of Canada within their respective jurisdiction and with the approval, as hereinafter provided, of a Joint Commission, to be known as the International Joint Commission.

The foregoing provisions are not intended to limit or interfere with the existing rights of the Government of the United States on the one side and the Government of the Dominion of Canada on the other, to undertake and carry on governmental works in boundary waters for the deepening of channels, the construction of breakwaters, the improvement of harbours, and other governmental works for the benefit of commerce and navigation, provided that such works are wholly on its own side of the line and do not materially affect the level or flow of the boundary waters on the other, nor are such provisions intended to interfere with the ordinary use of such waters for domestic and sanitary purposes."

(Appellant's Narrative, p. 532.)

It is apparent by this article that the contracting works of the character described were contemplated and in the minds of the high contracting parties; that is, that the United States might desire, in order to off-set for the claimed lowering of the levels of the lakes due to the Chicago diversion and other diversions, to build the contracting works recommended by the Board of Engineers on Waterway from Utica to the mouth of the Illinois River. Plans for works of this kind had been in contemplation for many years prior to the making of the Treaty. The Board of Engineers on Deep Waterways, in its report to the 56th Congress, 2nd Session, appointed pursuant to the Act of March 3, 1899, concerning the control of lake levels by building works of the character mentioned, recommended the construction of such works. (Rec. Vol. IV, p. 2387.) The International Waterways Commission likewise recommended the installation of such works. The Board of Engineers for Rivers and Harbors, in 1920,

reporting under the above mentioned resolution of June 30, 1917, with reference to all diversions from the Great Lakes, so recomended. (Appelant's Narrative, p. 102.)

The Court would have done complete equity between the parties, had it granted the motion and entered a decree accordingly. At comparatively small expense, the appellant could have been assured of the diversion from Lake Michigan of 10,000 seconds feet, absolutely required for the protection of the health of the people within its limits. On the other hand, the appellee would have, with the diversion to this amount existing, by the installation of these compensating or regulating works, had as good or better navigation facilities than would exist without the diversion.

It is fundamental, as stated in numerous cases, that it is within the power of a court of equity, in its discretion, to so enter a decree that neither party will be injured. The mere fact that this principle is sought to be applied to a novel situation, such as exists here, is no argument against its use. The fundamental principles of equity must be adjusted to every situation.

In

Myers v. *Block*, 120 U. S. 206, 214,

this Court said:

> "As to the power of a court of equity to impose any terms in its discretion, as a condition of granting or continuing an injunction, there can be no question."

In

Russell v. *Farley*, 105 U. S. 433, 438.

the question arose as to whether the Circuit Court had power to enter a decree on the subject of damages arising from an injunction where an injunction bond had been required. The Court discussed fully the powers of courts of equity to prescribe terms and conditions upon the parties at whose instance it proposed to act. The Court said:

> "The power to impose such conditions is founded upon and arises from the discretion which the court has in such cases, to grant or not to grant the injunction applied for."

Again it is stated, (p. 445)

> "The imposition of terms and conditions upon the parties before the court, is an incident to its jurisdiction over the case; and having possession of the principal case, it is fitting that it should have power to dispose of the incidents arising therein, and thus do complete justice and put an end to further litigation."

In

Marine Ins. Company v. *Hodgson*, 7 Cranch, 332,

the Court, by Chief Justice Marshall, said (337):

> "Being capable of imposing its own terms on the party to whom it grants relief, there may be cases in which its relief ought to be extended to a person who might have defended, but has omitted to defend himself at law."

See, also,

Veazie v. *Williams*, 8 Howard 134, 161.
Walden v. *Bodley*, 14 Peters 156, 164.

In

Newton v. *Consolidated Gas Co.*, 258 U. S. 165,

the District Court held an eighty-cent gas rate confiscatory, and entered a decree enjoining the enforcement of this rate, subject, however, to the condition that the company should not charge more than $1.20, and upheld the decree of the lower court in this respect. This Court said (177):

> "It was within the court's discretion to grant the injunction upon terms * * *."

In

Northern Pacific Railway Company v. *U. S.*, 104 Fed. 691, (C. C. A. 8th Circuit),

opposite the City of Grand Forks, NorthDakota, the railway company's tracks had been placed parallel with the bank of the Red River on the north and about 320 feet therefrom. The embankment of the railroad, by reason of its resting upon a sandy, clay stratum which extended to the river bed, caused a bar to be formed in the river, the railroad's embankment consequently settling. The railroad company was about to increase the height of the embankment to take care

of this settlement, when the United States brought suit in equity to enjoin it from so doing, under Section 10 of the Rivers and Harbors Act of September 19, 1890. A decree was entered accordingly. The Court of Appeals, however, found from the facts in the record that if the embankment were raised as proposed by the railroad company, ultimately this embankment would settle, so that it would extend through the clay, sandy stratum and rest upon a hard foundation, at which time there would be no further forming of the bar in the river; and it also found that, by dredging, the bar could be removed, and navigation would thus be unimpeded. The Court accordingly directed that the decree below be amended, as follows (p. 695):

> "The injunction hereby awarded shall not be so construed as to prevent the defendant company from proceeding with the work of raising its tracks between Cheyenne and Hill avenues to the proper level, if by dredging or otherwise, as the work progresses, it shall, at its own cost and expense, prevent the formation of any such bar in the channel of the Red River of the North as will at any time lessen or impair its navigability."

In many instances, the court of equity refuses relief to which the complainant may be, upon technical legal rights, entitled, where the granting of this relief would unjustly operate upon the defendant. In such case, if the payment of money damages will do justice to the complainant, the Court will impose that condition upon the defendant and deny the relief to the complainant.

In

Sanitary District of Chicago v. *Martin*, 227 Ill. 260,

the Sanitary District had acquired from Martin, in 1902, certain lands for right of way purposes. The deed contained a covenant that the Sanitary District should build a levee to protect certain other lands of Martin. This the District refused to do, on the ground that it did not have the right of way to build the levee and also because the cost of constructing the levee would be in the neighborhood of $60,000, whereas

the value of Martin's land and the damage to it was a very small amount compared with the cost of the levee. A bill for specific performance was filed. The Court refused Martin's relief and assessed the damages for the failure to build the levee. This was sustained by the Illinois Supreme Court. It said (268):

> "Appellant claims in its answer that the cost of the levee and ditch would be so much in excess of the benefit that it would be unjust and inequitable to require specific performance. The court accepted this view of the case, as it had a right to do, and sought to ascertain the damage in dollars and cents."

Cushman v. *Bonfield*, 139 Ill. 219.
Phillips v. *Thomson*, 1 Johnson Chan. 133.
2 Sutherland on Damages, 590.
Story's Equity Jurisprudence, 798.

(b) Assuming that appellee is legally entitled at some time to an injunction, a decree, providing for the reduction of the diversion below 10,000 cubic seconds feet before appellant and the cities, villages and towns within its limits can readjust their works of sewage disposal or of purifying the water supply, is contrary to equitable principles.

After the motion of July 12, 1920, relating to the settlement of the decree in the lower court, and in support of the allegations of said motion, it was proved by evidence offered, about which there is no dispute, that appellant had on August 7, 1919 (Appellant's Narrative, p. 339), by ordinance laid out a program or project for the construction of artificial sewage purification works to take care of the human sewage and trade wastes not to be disposed of by the 10,000 cubic seconds feet diversion. These works were completely described and it was shown that the program of construction covered a period of approximately twenty-five years—namely to the year 1945. There was described in detail the location of the works and the method of construction. These works

so to be constructed in said period, were designed to dispose of and purify the sewage of the population of appellants, which exceeded in that period 3,000,000 people, and also the trade waste, which was equal to the sewage of a population of a million and a half or two million people. (Appellant's Narrative, p. 362.) The cost of all these works was estimated to be upwards of a hundred million dollars. It was shown that the total amount that the appellant could raise by taxation and the issuance of bonds in that period would barely take care of this construction cost. (Appellant's Narrative, p. 382.)

The cities, towns and villages within appellant's limits take or obtain water from Lake Michigan for domestic use and disseminate it by mains and other devices to the consumer. With this function of municipal government, appellant has nothing to do. The water supply of the people within appellant's limits, is not now filtered, and under no circumstances can sewage or an effluent from artificial sewage purification works be permitted to come in contact with the water supply unless that water supply is filtered before being delivered to the consumer. (Appellant's Narrative, p. 365.) The cost of filtering the water supply is the enormous sum of one hundred million dollars, and the annual cost of operating the filtration plants is three and a half million dollars. (Appellant's Narrative, pp. 366, 367.) The cities, villages and towns within appellant's limits were not made parties to this suit by appellee. No evidence as to whether the municipalities actually delivering domestic water to the consumer can build such works, is before the court. When, if ever, such works may be built by such municipalities, so that the water supply to the consumer will be filtered, is not shown. Even with all the sewage purified, as best it can be, by artificial means, and the entire water supply filtered, there would still be obviously not only danger of, but actual, pollution to the water supply. That does not exist today. It would be a change from a perfect system in operation today to a makeshift. To accomplish this end, it would be necessary for the

appellant first to complete its project of 1945, whereby the sewage and waste equivalent of the population exceeding three million people is purified at a cost of upwards 100 millions of dollars; second, after 1945, to install works to completely purify the sewage of a population equivalent of three million people now taken care of by the 10,000 cubic seconds feet diversion, at a cost of approximately an additional two hundred thirty-eight million dollars. (Statement, p. 79.) In addition, it would be necessary for the cities, villages and towns within appellant's limits furnishing the water to the consumer, to install water filtration plants and operate same, at installation cost, as stated, of one hundred million dollars and annual operating cost of three and a half million. When this gigantic task, a make-shift, could be accomplished, is beyond the power of human beings to determine. These cities and towns furnishing the water to the consumer during all these years have relied upon having the ideal water supply produced by the diversion of sewage and drainage therefrom. They have, of course, made no plans for any other pure water supply.

A Court, in applying principles of equity between private persons, will refuse to impose upon the defendant a decree which would cause even great financial loss, to take effect immediately, but will so make its decree, that the defendant may re-adjust itself and thus avoid unreasonable loss. Here we have a defendant before the Court representing the public, which has installed works to protect the health and a decree which would absolutely, as the undisputed evidence shows, destroy the effectiveness of those works and cause the raging of diseases due to an impure water supply, including nuisances in rivers and canals flowing through populous sections. And these diversion works of appellant have been in operation for almost a quarter of a century, performing efficiently their functions of providing a pure water supply for the people of Chicago and its environs, preserving lives and protecting health. It has been practically a third of a century since the construction work of appellant was commenced.

The work of appellant was projected and carried out, not in the night time, but openly, within full view of every one, observed by appellee's engineer officers, under the eye of Congress as reported to it by the Secretary of War in the Chief of Engineers Reports. Congressional acts sought to utilize appellant's works and diversion for navigation purposes. The operation of these works received international consideration by the International Waterways Commission, and were recognized as proper by the Treaty of 1909. In fact, every Board of Engineers or Commission that reported upon the subject of the use made by appellant of the water from Lake Michigan to operate these works, has sanctioned it. But, strange to relate, we have the Attorney General, by the suit instituted October 6, 1913, attempting to enforce, by an injunction immediately an order made by the Secretary of War December 5, 1901, because of current in the Chicago River due to the then restricted channels of it and its branches. That current was removed. The order ceased to have any force or effect. Appellee is proceeding upon an alleged paper right without substance or reason beneath it.

Under Section 18 of the Rivers and Harbors Act of March 3, 1899, the Secretary of War may, after hearing and findings, cause the alteration of a bridge. We apprehend that an order of the Secretary, with reference to such a bridge, must provide a certain reasonable time within which the obstruction to navigation may be eliminated, thus giving the railroad company an opportunity to re-adjust itself. An order providing an unreasonably short time, would be held invalid, and a court of equity would grant relief.

Pomeroy's Equity Jurisprudence, states (Vol. 5, Sec. 1948, p. 4429):

> "Whenever necessary to prevent a hardship, a reasonable amount of time in which the defendant may conform to the injunction, may be allowed."

In

United States v. *Luce*, 141 Fed. 385, 422,

(Circuit Court of Delaware. Opinion of Judge Bradford) a bill was filed by the United States to enjoin the defend-

ants from further prosecuting their business of manufacturing oil and fertilizer from fish, or alternatively, from so prosecuting their business there, as to allow offensive odors from their factory premises to reach the quarantine station of the United States, in Delaware Bay, near Lewes. The Court found the operation of the defendant's plant to be a nuisance. With reference to the entering of the decree, the Court said:

> "* * * the defendants should be accorded a fair opportunity of suppressing the nuisance caused or contributed to by them, if they can."

In

Peck v. *Newberg Light, Heat & Power Company,* (Supreme Court, App. Div., 2nd Dept.) 116 N. Y. Supp. 433,

(Opinion by Judge Jenks), the Court found that a nuisance created by the vibration of the engines could be prevented by changing the foundations, and concluded (p. 436) that

> "* * * the defendant should have an opportunity for such correction, * * *."

Sammons v. *City of Gloversville,* 67 N. E. 622; 175 N. Y. 346.

(The Court of Appeals of New York, Opinion by Judge Gray). Plaintiff instituted the suit to restain the City of Gloversville from continuing to empty the contents of its sewers and drains into Cuyadutta Creek. The judgment of the lower court

> "* * * suspended the operation of the injunction for the period of one year, with the privilege to apply to the court for other suspensions of the decree in order that the defendant might obtain 'appropriate legislation,' or change its system of sewage."

This judgment was unanimously affirmed by the Appellate Division and by the Court of Appeals.

Both Judge Landis and Judge Carpenter in this case recognized that time should be allowed for re-adjustment, but both apparently felt that the case was one to be ultimately presented to this Court or to Congress, and that proper re-

lief, in any event, and in this respect, would be granted. Judge Landis said:

> "I had hoped, as I stated at the beginning, that there might be a composition of this thing. The judge has no right to have personal feelings, but I live in this community, and it was my hope that there could be devised a program that would enable this district to have the benefit of this water, as much as it needs, that will give to the country this water in the solving of this problem of navigation (sanitation)."

The Judge directed a decree to be drawn, enjoining the defendant from abstracting more than 4,167 seconds feet of water from Lake Michigan, and said:

> 'The order will not go into effect, it will be suspended until thirty days after the Supreme Court meets in October. That is plenty of time, is it not? * * * Under no circumstances does this order go into effect now. Make that sixty days, and you may put in it, if it does not destroy the appealability of the order, you may put in a provision retaining me in control. The thing that the government wants, at least the court wants, being a citizen of Chicago, the thing I want is water without microbes. That is why I have held your law-suit." (Appellant's Narrative, p. 97.)

Judge Carpenter said, in his opinion (Appellant's Narrative, p. 115.)

> "This matter is a subject which needs the consideration of thinking people, not only in the State of Illinois, but in the whole United States. The Treaty with Canada entered into some years ago seemed to contemplate an acquiescence on the part of the Canadian Government to the withdrawal of 10,000 cubic feet a second by the Drainage District. However, that may be, the Secretary of War has not given his official consent. Whether the increased withdrawal should or should not be made is properly a political and not a legal question, in the absence of consent by the Secretary of War. The Legislature of the State of Illinois, the various civic bodies, the Association of Commerce, and senators and representatives should see to it that at the earliest possible moment the situation here is brought to the attention of Congress, so that by appropriate legislation the health and welfare of this great community may be safeguarded.

I have no doubt that when the matter is properly presented it will be taken up by Congress and by the State Department, and some plan devised which will bring about adequate and the desired results.

It goes without saying that this Court will not issue an injunction to be effective forthwith.

* * *

On the testimony of the Government engineers the Court might in the exercise of a sound discretion, delay the effectiveness of its injunction for from fifteen to twenty-five years to enable the Sanitary District or the State of Illinois to arrange for other means of disposal of the sewerage now handled by the Sanitary District.

Believing as I do that it is a matter for the immediate action of Congress, a decree may be prepared finding the facts as stated in the Bill and enjoining the defendant from withdrawing from Lake Michigan in excess of 4,167 cubic feet a second; the decree, however, not to go into effect for six months.

The matter must necessarily go to the Supreme Court of the United States for final settlement, and no doubt, if need be, when the record is there filed, application may be made to that Court for a supersedeas or further stay."

Afterwards, Judge Carpenter (June 29, 1923), in granting the appeal to this Court, suspended the injunction during its pendency.

(c) The decree of injunction in the court below absolutely enjoined appellant from withdrawing from Lake Michigan in excess of 4,167 seconds feet without any condition. The Secretary of War would be powerless, under this decree, to permit or authorize any further diversion. This condition should have been observed.

On appellee's theory the Secretary of War has the authority to authorize the diversion, otherwise he would have no right to limit. The injunction suit is based upon the limitation made by the Secretary of War December 5, 1901. Obviously, the decree should have provided that it should be subject to any further action that the Secretary of War

might take in authorizing or consenting to a diversion in excess of the limitation of December 5, 1901 (4,167 cubic seconds feet).

Furthermore, as it appeared from the record, many things had transpired since the limitation of December 5, 1901. Over ten years had elapsed between the refusal of the Secretary of War on January 8, 1913, to remove the limitation and the date of the entry of the decree, June 18, 1823.

This was a suit instituted by the Attorney General under Section 12 of the Rivers and Harbors Act of March 3, 1899. In view of the lapse of time, the lower court should have directed that the matter be presented again to the Secretary of War before a decree was entered at such late date enforcing an order of the Secretary of War made twenty-two years prior thereto.

This is particularly true in view of the many things that had transpired—among others, negotiations between the War Department and appellant, as represented by appellant's ordinance of August 7, 1919, (Appellant's Narrative, p. 339), and as shown by the letter of the Division Engineer at Chicago to the Chief of Engineers of May 24, 1921. (Appellant's Narrative, p. 344.)

The Transportation Act of 1920 (41 Statutes at Large, 456), Section 500 thereof, particularly, directs the Secretary of War to develop water transportation by inland waterways, co-operate with municipal governments and "to investigate any other matter that may tend to promote and encourage inland water transportation." (41 Statutes at Large, 499.) The existence of this act is a further reason why this whole matter should have been further considered by the Secretary of War, before the limitation made twenty-two years ago as to the withdrawal from Lake Michigan, should be enforced. Under the Transportation Act mentioned, the Secretary's duties were much broader than under any previous legislation. In investigating the matter of diversion, it would be necessary for him to take into consideration the

question of the use of appellant's diversion for navigation and to have given force and effect to the various reports made pursuant to acts of Congress that any damage to the Great Lakes by the diversion, could be entirely compensated for by building contracting or regulating works. Compensation or regulating works would thus take care of any damage to commerce on the Great Lakes by reason of the diversion, and the diversion would at the same time make available a deep waterway from Chicago direct to the Gulf of Mexico through the Sanitary and Ship Canal, the Desplaines, Illinois and Mississippi Rivers. This broad question might well be considered by him under said Transportation Act.

(d) This matter should be settled by Congress.

In February, 1924, appellee asked that this case be set for an early hearing. Appellant objected, on the ground that bills had been and were pending in Congress looking to direct authorization of this diversion. Since that time hearings have been had on a number of bills pending before the House of Representatives by the Rivers and Harbors Committee. The hearings on these bills were not concluded, when the last session of this Congress ended, and the Committee adjourned to take up the matter at the next session of this Congress. The said bills are still pending, undisposed of by said committee on River and Harbors of the House, no action has been taken thereon, and they have not yet been reported. We believe that this matter, in any event, is one which should be disposed of by co-operative study.

New York v. *New Jersey and Passaic Valley Sewage Commissioners*, 256 U. S. 296, 313:

"We cannot withhold the suggestion, inspired by the consideration of this case, that the grave problem of sewage disposal presented by the large and growing populations living on the shores of New York Bay is one more likely to be wisely solved by co-operative study and by conference and mutual concession on the part of representatives of the States so vitally interested in it than by proceedings in any court, however constituted."

In

Virginia v. *West Virginia*, 246 U. S. 565,

this Court, while giving an opinion upon certain of the points involved, reserved further action to enable the parties to reach an adjustment of their differences impelled by consideration of "the character of the parties."

Hon. John W. Davis, in an address before the New York State Bar Association, January 20, 1922, in discussing the above case, *Virginia* v. *West Virginia*, said (Amer. Bar Assn. Journal, February, 1922, Vol. VIII, pp. 77-82):

> "* * * after suggesting the possibility of Congress coming to the aid of the Court and hinting at the power of the Court itself to decide the amount and method of taxation to be put into effect, the Court with a call for further argument postponed its decision and threw itself back once more upon the sense of duty and the suggestions of self-interest of the contending parties. It is gratifying to reflect that this last appeal was not made in vain, and that an amicable adjustment by the States themselves proved one more the moral power of the Court, and vindicated its confident reliance upon 'a decent respect to the opinions of mankind' as the ultimate sanction of its judgments."

The Secretary of War in the May 8, 1899 permit for the opening of the Sanitary and Ship Canal, and in almost every permit issued in connection with this matter, stated:

> "1. That it be distinctly understood that it is the intention of the Secretary of War to submit the questions connected with the work of the Sanitary District of Chicago to Congress for consideration and final action, and that this permit shall be subject to such action as may be taken by Congress."

CONCLUSION.

The history of the establishment of the Chicago diversion to the capacity of appellant's works as fixed by the Illinois Statutes and the connection of appellee with it, discloses a well settled policy of appellee to co-operate with the State of Illinois, extending over a period of almost a century. The people of Chicago and environs, relying upon this policy, expended millions to also utilize the resultant waterway for the protection of their water supply; and they have so used it for upwards of sixty years. Until the refusal of Secretary Stimson to specifically authorize the diversion to the amount of 10,000 seconds feet and the further act of the Attorney General in filing the bill for injunction on October 6, 1913, there was no digression. This former policy of co-operation by the Government is in every respect in keeping with appellant's position here. Appellee by such action not only recognized the specific authority for the diversion, under the Act of Congress of March 2, 1827, for the construction of the Illinois and Michigan Canal, but also the authority of Illinois under its police power as expressed by the Act of May 29, 1889, under which the Sanitary District was organized. Not only acts of engineer officers and the Secretary of War, but also acts of Congress, are evidence of appellee's recognition of appellant's right in the premises.

Appellant's Sanitary & Ship Canal was under construction for years, to be used in diverting from Lake Michigan a definite quantity of water. To use the canal as it was constructed, it was necessary to effectively connect its northern terminus with Lake Michigan. The capacity of the channels of the Chicago River and its branches was originally not sufficient. Excavating to widen and deepen these channels was necessary. The preliminary work of excavation to provide for the initial operation of the channel was authorized.

To open the Sanitary and Ship Canal after it was completed, it was necessary to do certain work. This was authorized by the principal permit of May 8, 1899, without limitation as to amount of flow, except as to a current in the Chicago River becoming unreasonably obstructive to navigation. It was understood that further work of excavating in the Chicago River and its branches was necessary to provide for the water for the increase in population. In due course this further work of excavating in the channels of these rivers to make them large enough for the maximum diversion was authorized. The work was done, performed and carried out in accordance with the plans for such work, as authorized by the Secretary of War.

The work of excavating the channels of the Chicago River and its branches ~~having not~~ has been performed as authorized. If further excavation were necessary to enlarge them so that a current would not be obstructive to navigation thereon, then a decree should have been entered allowing appellant its full diversion, but containing a condition that appellant further improve those channels.

The Secretary of War recognized that the problem, making necessary appellant's diversion works, was one of great public importance, which might be submitted to Congress. The Secretary reported everything to Congress. Congress not only did not act in any manner indicating an intention to limit the operation of the works, but, on the contrary, acted in such manner as to show its purpose to utilize the works and the attendant diversion for navigation. It also evinced the intention to build works in connecting channels of the Great Lakes to offset for any diversion. So the facts show appellant was acting with the co-operation of the Federal Government in the solution of this problem. It had the right to believe that its exercise of the police power of the state in this reasonable manner was lawful.

Appellant is not attempting to divert from Lake Michigan an unlimited amount of water. Its purpose now, and the rec-

ord discloses no other, is to withdraw only a reasonable amount for the protection of the water supply, for navigation and to prevent nuisances. That amount was deliberately fixed a third of a century ago when its Sanitary and Ship Canal was laid out. It then appropriated the quantity of water necessary, as fixed. No one questioned its right.

Appellant's offer (July 12, 1920,) to defray the expense of building works in the Great Lakes outlets to offset for any claimed injury to commerce on the Great Lakes was more than equity required. It should have been accepted by the court. A decree should have been entered allowing appellant to divert the 10,000 cubic seconds feet of water from Lake Michigan on condition that it comply with its offer. Appellee would thereby have been protected in the only interest it has in this suit —navigation upon the Great Lakes system. That was the least the court could have done for appellant.

Appellant is now confronted with a decree which will compel appellant to change its plan for a deep waterway and its whole policy of protecting public health, the works to accomplish which were determined upon after deliberate and careful investigation, to throw aside the works thus constructed at a cost of many millions of dollars, and to enter upon another and different method of protecting the water supply, the execution of which will cost a gigantic sum, which method in effectiveness will be, at best, a mere shadow of that already in use.

The decree of the District Court should be reversed.

Respectfully submitted,

IN THE

SUPREME COURT OF THE UNITED STATES

OCTOBER TERM, A. D. 1924.

THE SANITARY DISTRICT OF CHICAGO, *Appellant*, vs. THE UNITED STATES OF AMERICA, *Appellee*.	Appeal from the District Court of the United States for the Northern District of Illinois Eastern Division.

REPLY BRIEF AND ARGUMENT FOR APPELLANT.

MAY IT PLEASE THE COURT:

Appellee's brief is voluminous. There are many inaccurate statements of fact, the incorrectness of which in every instance we will show by quotations from or reference to the record. Several hundred authorities are cited. The limited time at our disposal does not permit an analyzation of each case. We are compelled to confine ourselves to a consideration in this brief of only the cases from which quotations have been made by appellee, or upon which it particularly relies. The seemingly harsh criticisms of our statements of fact and points and arguments, appearing at so many places in appellee's long brief, will not be answered by us in kind. We will, however, take up *seriatim* the various incorrect statements of fact and points and arguments contained in appellee's brief.

The briefs filed by *amici curiae* in support of appellee's position, being States of Indiana, Michigan, Minnesota, New York, Ohio, Pennsylvania, Wisconsin and Lake Carriers' Association, as *amici curiae,* are discussed in the briefs filed supporting appellant's position, by *amici curiae,* being States of Illinois, Missouri, Tennessee, Louisiana, Chamber of Commerce of St. Louis, Memphis Chamber of Commerce, New Orleans Board of Trade, New Orleans Association of Commerce, the Mississippi Valley Association, the Chicago Association of Commerce.

APPELLEE'S ARGUMENT ON THE FACTS.

(Its Brief, p. 1.)

Appellee's so-called argument on the facts should properly be disregarded in the consideration of the issues here, as it is largely repetition. Most of the facts stated by appellee are restated in its argument on the law in the places where appellee's counsel have attempted to apply authorities to the facts. Many facts appearing in our statement are merely restated by appellee. In that portion of this reply Brief where we discuss appellee's points and authorities, we have, in *extenso,* by reference to or quotations from the record or appellant's narrative, demonstrated the incorrectness of various statements of fact which do not agree with those stated by us in our original brief. Therefore, in discussing appellee's Argument on the facts, we will only refer to some of the most glaring inaccuracies.

To avoid repetition, we will carry in the margin of the discussion of appellee's argument on the facts, a reference to the page of its argument where may be found the matter considered by us to be incorrect. We may also refer by page to portions of our reply brief where, in discussing appellee's legal points, we have shown the inaccuracy of appellee's statements of fact.

Page of Appellee's Brief.

2 The appellant does not propose to divert 20,000 cubic feet per minute for each one hundred thousand of the population in 1960. The Sanitary and Ship Canal was only authorized to be built for a capacity of approximately 10,000 cubic feet per second. The capacity in the rock section is 14,000 cubic seconds feet. (Cooley, Appellant's Narrative, p. 295.)

There is no evidence in the record that the City of Chicago has profited by cheap water supply in comparison with other cities on the Great Lakes. The record does not disclose whether the water supply of such other cities is cheap or expensive. It does disclose, however, that the water supply of the people of Chicago as produced by appellant's works, is much better than the other cities, the death rate from typhoid fever for Chicago being very much below that of other cities. (Appellant's Narrative, p. 203.)

5 The record does not disclose any motion made by appellee to strike portions of appellant's answer in the Main Channel suit. No order was ever entered concerning any such motion. There was only a notice given by appellee that it would make such a motion on February 28, 1914. (Rec., Vol. III, p. 126.)

What Judge Landis said he might do, is unimportant. It was a mere oral opinion. It was not signed by him. Judge Carpenter entered the final orders and decrees. He rendered an opinion. (Appellant's Narrative, 113.) There is no mention in his opinion of any motion to strike or that he would enter any order concerning it, or as to any agreement or understanding such as counsel refers to, concerning their presenting evidence in opposition to that offered by appellant in support of the portions of its answer of which appellee complains.

Furthermore, appellee filed exceptions on June 25, 1908, among others, to the three principal affirmative defenses set forth in appellant's answer to the complaint in the Calumet River suit. The exceptions were overruled on June 26, 1908. (Appellee's Brief, p. 11.) The three principal affirmative defenses set up in this answer were the same affirmative defenses alleged in the answer in the Main Channel suit. The exceptions filed to the answer in the Calumet River suit raised the issue as to rele-

vancy and materiality that it is claimed was raised by appellee's alleged motion to strike certain portions of appellant's answer to the Main Channel suit. Thus it was apparent that the motion to strike portions of appellant's answer in the Main Channel suit, was in effect passed upon when the court overruled the exceptions to the answer in the Calumet River suit. Appellee cannot here claim that it did not have an opportunity to meet various affirmative defenses of appellant, as they were direct issues in the case. They were kept in the case by order of the court. The case was tried on the issues raised by the bills and answers as filed.

18 Appellee's counsel suggest that the delay in the final disposition of this case in the District Court, was due to appellant. The record does not disclose any such facts. They refer to Vol. VI pp. 3878-80, which is merely a memorandum for the Secretary of War by the Chief of Engineers, dated December 18, 1911, not quite three years after the first suit was instituted, and approximately three years before the second suit, the Main Channel suit, was commenced. Furthermore, some suggestion has been made that all of appellee's evidence was submitted, and appellant delayed putting in its evidence. The record discloses that the evidence of appellee as to current in the Chicago River was not presented until April, 1914. (Rec., Vol. V, pp. 1320-30, witnesses Emerson, Minskey, Green, Hamilton and Simmons.)

This was after appellant had submitted all its evidence in chief, and when appellee was presenting its rebuttal.

Counsel say: "Judge Landis in effect found." There was no decree entered by Judge Landis. There was no memorandum signed by him; there was a mere oral opinion in the nature of a direction for preparation of a decree. And he never reached a position where he performed or was about to perform, any formal act of en-

tering an order or even signing a memorandum stating his conclusions.

23 We take issue with counsel's construction of Section 23 of appellant's Organic Act. This section expressly provided that the canal should be of capacity of not less than 300,000 cubic feet of water per minute, to be of a depth of not less than 14 feet, with current not exceeding three miles per hour, "*and if any portion of such channel shall be cut through a territory with a rocky stratum where such rocky stratum is above a grade sufficient to produce a depth of water from Lake Michigan, of not less than* 18 *feet, such portion of said channel shall have double the flowing capacity above provided for.*" (Appellant's Narrative, p. 73.) The channel was so constructed across the rocky stratum, as it was intended it should be at the time the Act of May 29, 1889, was passed.

26 The date of the commencement of work is prior to September 19, 1890, as set forth elsewhere. (*Infra*, p. 27.)

27 The subject matter of Major Marshall's letter of August 24, 1892, was the item in the Rivers and Harbors bill of July 13, 1892, asking that the engineer at Chicago submit a report as to improvement in the Chicago River, and related to cooperation by the Federal Government with appellant in appellant's plans for deepening and widening the Chicago River and its branches, to make it the supply channel by which the waters of Lake Michigan could be carried to the Sanitary and Ship Canal, as stated in the resolution of appellant's board of trustees of April 21, 1891. (Appellant's Narrative, p. 454.) The cooperation mentioned was given appellant by Congress in many acts following the one under which Capt. Marshall was to make his report, mentioned in said letter of August 24, 1892, which are set forth elsewhere herein. (*Infra*, pp. 104 to 110.)

The president of appellant's board, in replying to said letter of Capt. Marshall, August 25, 1892, said (Rec., Vol. IV, p. 2377):

> "I am personally very glad to note in your communication your good will towards the enterprise in which we are engaged, and I trust that the good feeling which exists will tend towards a proper solution of the question of a waterway from the Lakes to the Mississippi."

The letter of Capt. Marshall, May 23, 1893, part of which is quoted by appellee, also stated (Rec., Vol. IV, p. 2378):

> "I have to say for the information of your Honorable Body, that however I may differ from the local authorities as to the methods adopted by them for the amelioration or care of their defective sewerage, and water supply, that *I recognize their right and the authority and capacity of the commonwealth of Illinois and the municipality of Chicago to deal with their local matters in their own way*, and that having declared their choice, *United States officers shall place full faith and credence in their acts*. This office then, as far as not called by law to express opinions, etc., shall work in accord with local laws to further rather than obstruct, their ends and objects, as expressed clearly by the laws of the locality.
>
> • • •
>
> I have to say that I desire the backing and cooperation of the Trustees of the Sanitary District of Chicago to prevent any encroachments whatever upon the present channel of Chicago River, and to express to the Trustees of the Sanitary District my disinclination to recommend to the Secretary of War any restriction by bridges, filling or otherwise upon the capacity of the Chicago River, except where imperatively demanded by the people of Chicago in crossing the river by bridges.
>
> An examination of the locality in question will be made at the earliest practicable date, and if it be found that it comes within the purview of the in-

structions issued to the United States District Attorney to stop by injunction from an United States Court such encroachment this action will undoubtedly be taken on my application, by the District Attorney."

It will be observed from the above quotations that the engineer officer at Chicago recognized the full authority of appellant to proceed in the manner it was doing, and that it construed appellant's program as lawful and properly sanctioned. (Point I-D of our original brief, p. 128.)

Furthermore, it is apparent Capt. Marshall recognized that appellant would have to enlarge the channels of these rivers and he proposed to prevent encroachments, which would be in the way of appellant's work there.

28 Capt. Marshall's report of August 9, 1893, is analyzed herein. (*Infra*, p. 105.)

The letter of Col. Poe of March 22, 1895, asked for information from appellant. Apparently Col. Poe and his Board received all they desired, for in the second paragraph of the Board's report, it is stated (Appellant's Narrative, p. 465):

"The Board met in Chicago August 12, 1895, and on the 13th and 14th accompanied the officers of the Drainage Canal over the line under construction. Every facility and courtesy possible has been extended by the trustees and engineers of the canal for a full investigation of the subject matter."

Counsel quote certain portions of the report of the Board of Engineers, of which General Poe was chairman, dated August 16, 1895, and state that by that report the United States "*asserted its paramount control with respect to the creation of obstructions to navigable waters.*" This is entirely refuted by the following sentence in said report (Appellant's Narrative, p. 470):

"With this an established fact it is impossible to think that U. S. supervision shall not be extended to the Chicago Drainage Canal in due time."

There was not only no question of authority, but an express statement by this board of engineers of which the United States engineer at Chicago was a member (Major Marshall) but on the contrary an express statement that Congress had not then exercised control over the use and diversions of United States navigable waters for domestic and sanitary purposes. The report is in keeping with the attitude of the same United States engineer at Chicago, as shown by his other reports on this subject, and with our contentions.

31 The United States officers observed appellant's work, made careful study and investigation of its purpose and the effect of the operation of the works, and reported the same to Congress. The United States itself did not assert any control. Congress never acted at any time in opposition to appellant and is not acting.

35 The argument as to the effect of Section 10 of the Act of March 3, 1899, has no place in the Argument on the facts, and has been fully considered by us in our original brief, (Points I and II, pp. 111-140) and also herein (Infra, p. 50.)

37 The only possible condition of the full diversion under the permits mentioned and according to the conditions thereof to be taken up, was the question of current in the Chicago River. The only thing that appellee's officers were concerned about, and considered they had authority to determine, was the question of the reversal of the Chicago River and current therein.

41 The contentions of appellee as to the effect of the July 11, 1900 permits are elsewhere discussed herein. (*Infra*, p. 89.)

48 The statement of the Secretary of War of January 8, 1913, refusing to remove the limitation of the order of December 5, 1901, and to specifically grant authority for

10,000 seconds feet diversion, is discussed under Point VIII of our original brief, (p. 205).

51 The Wilmette permit, September 11, 1907, is referred to us herein. (*Infra*, p. 64.)

53 The effect of counsel's position as to the Calumet permit, June 30, 1910, is discussed by us elsewhere herein. *Infra*, p. 65.)

against appellant or its officers under Section 12 of said

57 There was no admission by appellant of the correctness of the allegations as to the lowering of the levels of the Lakes in the hearing before Secretary of War Stimson, except for the purpose of that argument. (*Infra*, p. 58.)

58 As to the so-called decision of Secretary of War Stimson of January 8, 1913, see our original brief. (Point VIII, p. 205.)

64 What purpose counsel have in referring to the letters of February 24, 1913, and March 15, 1913, from the Engineer Department of the United States, in which they threaten state officers performing their duties under mandatory provisions of state law in the interest of public health, with penal action, is impossible for us to even guess. It is not likely that any United States attorney at Chicago would have considered seriously a suggestion by the War Department that criminal action be taken Act of March 3, 1899. It would seem only proper that appellee's counsel should quote the portions of the letters of Mr. Adcock to the War Department referred to

66 which show the true import of said letter. The correctness of the statement in that letter to the effect that the International Waterways Commission by its report of January 4, 1907, had recommended a diversion of 10,000 cubic seconds feet of water at Chicago, is considered elsewhere herein. (*Infra*, p. 82.) Just before ap-

pellee's last quotation from said letter of March 22, 1913, the following appears (Rec., Vol. VI, p. 3972):

> " 'Until the decision of the Honorable Secretary of War of January 8, 1913, it was the general belief that the Secretary of War would without question formally consent under present existing conditions to the taking of water up to at least 10,000 cubic feet per second from Lake Michigan through the channels of the Sanitary District.
>
> The Act under which the Sanitary District is organized and under which it is now operating makes it mandatory upon the Trustees of the Sanitary District to cause not less than 20,000 cubic feet of water per minute for each 100,000 of the population of the District to flow from Lake Michigan through its channels. The population of the District is such that to comply with its organic law, it is necessary that the Board of Trustees cause more than 4,167 cubic feet of water per second to flow through the channels of the Sanitary District. That condition has existed for a number of years past and the Sanitary District has been flowing through its channels sufficient water to dilute the sewage pursuant to its Organic Act (20,000 cubic feet per minute for each 100,000 of population). The Sanitary District cannot either under the law of its creation or if it intends to preserve the health of the inhabitants of the District reduce that flow.
>
> I have at some length pointed out to you the facts with most of which no doubt you are familiar so that the situation in which the Sanitary District is now placed may be fully considered by you.' "

It concludes as follows (Rec. Vol. VI, p. 3973):

> " 'I respectfully request that before any definite conclusion is reached by the Government with reference to these suggestions that a conference be arranged between the representatives of the Sanitary District and the Government at such time and place as may be convenient to the Government representatives.' "

So it is apparent that the letter is merely a suggestion for future conference. Furthermore, it set forth the

utter futility and childishness of the War Department suggestion for any penal proceedings.

67 Appellee has failed to give consideration to the ordinance of the Board of Trustees of appellant of August 7, 1919, under which a project was laid out for the construction of artificial sewage purification works by appellant during the period ending with 1945, whereby the sewage and waste of the population over 3,000,000 would be taken care of without additional diversion from Lake Michigan. This program was explained in detail by the witness Langdon Pearse, to which there is no evidence to the contrary. (Appellant's Narrative 345-361.) This ordinance of August 7, 1919, was passed by appellant's board of trustees in cooperation with the United States Engineer officer at Chicago, Col. William V. Judson, as is shown by his letter of May 24, 1921, to the Chief of Engineers, U. S. A. (Appellant's Narrative 344.) After describing the project for artificial sewage disposal laid out by appellant under the ordinance of August 7, 1919, Colonel Judson in his letter concludes (Appellant's Narrative 354):

> "'20. In the meantime the Sanitary Trustees are proceeding energetically with their plans for sewage treatment and disposal as outlined in enclosed memorandum. Since the date of their report, they have acquired 180 acres of land located on the North Shore Channel as a site for their proposed North Side purification plant.
>
> 21. The progress made by the Sanitary District is well illustrated by Exhibits E and F constituting part of enclosure showing their budget appropriation for 1921 and their expenditures during the ten year period 1910-1920. During the last named period the expenditure for sewage treatment works has amounted to approximately $9,400,000. Their budget for 1921 provides $6,500,800 for the completion of old projects and $3,242,500 for new projects.
>
> 22. The program of the Sanitary District, if carried out, will insure the practicability of keeping the

volume of water diverted from Lake Michigan within limits which it is hoped all concerned will finally deem reasonable.' "

The above quotation from Col. Judson's letter of May 24, 1921, to the Chief of Engineers, must be read, of course, in connection with his letter to the Chief of Engineers dated March 23, 1921 (H. R. Doc. No. 2, 67th Congress, 1st Session), wherein he speaks of the amount of diversion required for a deep waterway from the lakes to the Gulf, and concludes as follows (*Infra*, p. 75.):

> "Then should Congress place the limit of the amount of water to be withdrawn from lake Michigan at 10,000 seconds feet, which I deem probable and under proper conditions advisable, that increment would of itself increase the depth to 9 feet."

So, when Col. Judson in the last paragraph of the quotation from his May 24, 1921, letter stated that the program of appellant would keep the flow *"within limits which it is hoped all concerned will finally deem reasonable,"* he had in mind the 10,000 cubic seconds feet of water mentioned in his letter of March 23, 1921, when he spoke of the limit of the water to be withdrawn as 10,000 seconds feet *"probable and under proper conditions advisable."*

69 The table shows the yearly average withdrawal from 1900 to 1913 inclusive. It was not until the end of the period shown (1913) that the appellant's diversion works were entirely completed. It was a physical impossibility until the channels of the Chicago River were substantially deepened and widened, as authorized under the permits of the Secretary of War of July 11, 1900, to withdraw through these channels the full 10,000 cubic seconds feet. All this was shown by Mr. Randolph. (*Infra*, p. 43.) Furthermore, the necessity for the full 10,000 seconds feet diversion in order to keep the Chicago River at all

times flowing away from Lake Michigan, became more marked as the sewered and paved area of Chicago and its environs increased, because of which the floods would be more quickly delivered to the river.

78-114 Appellee has devoted many pages to a discussion of the evidence concerning the Great Lakes and claimed damage to commerce; that is, the theoretical effect of appellant's diversion at Chicago upon the levels of the Great Lakes and their connecting channels, including the theoretical damage to commerce. We believe that in our original brief (Statement of the case, pp. 63 to 69) this evidence is fully set forth and in such manner that it can be understood. Only one conclusion can be drawn from a perusal of appellant's discussion of the hydraulic evidence and the evidence relating to commerce; and that conclusion is that the whole basis of appellee's case is theory of experts. The results depend upon an inference of the unseen. No lay witness has testified as to the actual lowering of the levels of the lakes or their connecting channels, or that damage to commerce has been observed, notwithstanding the diversion has existed for almost a quarter of a century.

We will, however, briefly refer to certain pertinent facts appearing in the record relating to the character of appellee's conclusions as to the Chicago diversion's effect upon the levels of the lakes. Obviously the ascertainment of the correct increment of the different outlet rivers, was important. We have pointed out the ingenious process by which appellant's experts sought to obtain an increment. (Appellant's Statement, Original Brief, p. 64.) In the first place, a great number of discharge measurements were required to be made and tied or related to the level of the controlling lake which produced or was responsible for the amount of discharge at the time the measurement was made. The measurement

of the discharge was a complicated matter, and required the exact determination of the cross sections of these great rivers at the place called the discharge measurement section. It required, also, the correct establishment of the rate of flow at a given instant. A current meter was used, called the Haskell meter. There were two kinds of meters, and there were numbers of methods for determining rate of current. Various witnesses differed as to what instrument should be used. However, the discharge measurements were made by the United States Lake Survey and they used a Haskell current meter. Some of the sources of error occurring appear in the record.

The correctness of such measurements of discharge depend first upon the *rating of the meter,* that is, the relation of the revolutions of the meter wheel in a given time to the velocity of the water passing it. Due to changes in lubrication resulting from the displacement of the oil by water, the revolutions for a given velocity decrease as the time of immersion increases. (Haskell, Vol. V, pp. 2737, 2738; Shenehon, Vol. V, pp. 3374, 3380.) Variations of as much as 2 per cent in a day have been noticed. (Shenehon, Vol. I, pp. 352, 366.) In rating meters by the methods used by the lake survey in the field it is not possible to subject them to as rigorous conditions as those they encounter in actual gaging, on account of the limits of human endurance. (Williams, Vol. II, p. 908.) It follows then that when a meter has been used in a gaging for two hours the lubricant has been materially more reduced than by two hours of rating, where during a considerable portion of the time the meter wheel would not be rotating, while in the stream it is in motion continuously. The erroneous indication resulting from applying the average results of a rating to obtain the average results of a gaging are

in one direction and produce an indication of velocity less than the true one. (Williams, Vol. II, pp. 913, 963.)

The effect of *turbulence* and *pulsations* upon meter indications has been presented by Williams, Schoder and Turner, and by experiment was found to reduce the meter indication practically 10 per cent. (Williams, Vol. II, pp. 734, 958; Schoder, Vol. III, p. 1549; Turner, Vol. III, p. 1575.) Pulsations are present at all the gaging stations to some extent and decided turbulence is encountered especially at the bridge and open sections of the Niagara. (Freeman, Vol. III, pp. 1165, 1186; Williams, Vol. II, p. 733.)

The next source of inaccuracy in a meter measurement of flow is in the determination of the *area of the cross section.* For this work the Engineers of the Lake Survey have developed processes of considerable refinement, involving corrections of observed depths from a theoretically computed table designed to provide for the drift of the sounding weight due to the current. (Moore, Vol. I, p. 255; Moore, Vol. V, p. 2908.) No experimental evidence of the accuracy of these corrections has been submitted in this case and the question still remains unsettled as to whether the corrections applied may have been too little or too great.

Necessarily it is not possible to sound every point of the bottom and soundings were taken at intervals usually of from 10 to 20 feet. (Moore, Vol. V, pp. 2897, 2902; Shenehon, Vol. I, p. 299.) What the elevation of the bottom may have been between soundings is unknown, but is assumed to be uniformly varying from one to the other. The area of the cross-section changes as the lake rises and falls and sometimes the surface rises more at one end of the section than at the other. (Rec., Vol. I, p. 191.) The witnesses for appellee have claimed an

accuracy of from 1 to ½ of 1 per cent for the determination of area. (Shenehon, Vol. I, p. 311; Moore, Vol. V, p. 2870; Richmond, Vol. V, p. 2942; Ray, Vol. V, p. 2801; Haskell, Vol. V, p. 2662.) In water averaging 25 ft. depth an error of 3 inches would represent 1 per cent and, with the possibility of an unmeasured variation of 1 inch at the surface, the soundings must be made within ½ inch to maintain the accuracy of ½ of 1 per cent that is claimed by the appellee's witnesses. The probability of this is left to the judgment of the court.

However, the sounding of a section is one thing and keeping the meter on it in a swiftly flowing stream is quite another. As shown by the testimony of Williams, uncontradicted by appellee, at the Niagara bridge section the meter was several feet away from the section sounded and in an area considerably larger, the apparent discharge being thus reduced by an error of about 3 to 6 per cent. (Williams, Vol. VI, p. 3531.)

The next source of error is that due to the fact that the *velocity in only a part of the section* is *observed* by the meter. (Haskell, Vol. V, p. 2739; Shenehon, Vol. I, p. 341.) In a so-called discharge measurement at the Bridge Section of the Niagara River as shown by Plate No. 5, Rec., Vol. IV, p. 2475, the velocity was observed at 21 index points. (Shenehon, Vol. I, p. 299.) As shown by the Report of F. C. Shenehon (Rec., Vol. IV, p. 2466), and Shenehon's Testimony (Rec., Vol. I, p. 352), when the meters were within 5 feet of each other their indications failed to agree within one or two per cent. The area of a meter wheel is considerably less than half a foot (Haskell, Vol. V, p. 2739), and if for the sake of argument it be granted that its revolutions correctly represent the velocity in an area two feet square with the meter at the center, the area of stream actually measured would be 4 x 21—84 square feet out of an area of over 41,000 square feet, or by observing the velocity in 2/10 of 1

per cent of the stream it is assumed by the appellee's witnesses that they know of the velocity in the remaining 99.8 per cent within ½ of 1 per cent. (Moore, Vol. V, p. 2870; Haskell, Vol. V, p. 2714.)

If the observations taken in the so-called co-efficient work be included there are by Shenehon's Report about 90 x 11—990 positions occupied by the meter (Rec., Vol. IV, p. 2469), and granting each position to cover four square feet there are about 4,000 square feet of current measured out of a total of 41,000, so that on a most liberal estimate, the velocity in 90 per cent of the stream is unmeasured and only guessed at, yet it is claimed that the discharge is known within ½ of 1 per cent.

Lack of Evidence of Accuracy. In spite of these claims of accuracy there is no evidence to support them and they must be regarded as mere expressions of opinion of more or less qualified experts. The appellee has submitted no evidence that in the disturbed water of the Niagara River the meter registers within ten or any other per cent of correctness, while appellant has shown that under similar conditions it under-registers anywhere from five to ten per cent. (Schoder, Vol. III, p. 1548.) The only basis for a claim to accuracy in the work of the complainant is in the correspondence of the discharges at different and the same sections (Haskell, Vol. V, p. 2662; Shenehon, Vol. V, p. 3170), and this is no evidence of accuracy, as each may be and probably is, in error several per cent in the same direction due to effects of turbulence, incomplete investigation of the cross section of the stream, and variations of rating of meters due to changing conditions of lubrication.

In speaking of the determination of the increment of the St. Lawrence, Mr. Shenehon, the principal witness for appellee, said (Rec., Vol. V, p. 3182):

> "We had, I believe, only 93 observations. Those were in two groups, the lower ones being in one sea-

son and the upper ones in the second season. It appears at the present time that an error did enter there. This is still in the melting pot, and we don't know our increment as accurately, or we did not know our increment as accurately on the St. Lawrence as indicated by my original testimony; that is, that is the indication from the present investigations.

* * *

I believe the error in the St. Lawrence increment as originally derived and as finally derived, is somewhere in the neighborhood, that is the difference is somewhere in the neighborhood of 10 or 15 per cent."

Major Keller, one of appellee's witnesses, stated (Rec., Vol. I, p. 229):

"A. I think that in all probability the results that I have just given are accurate within approximately 5 per cent.

Q. Can you, without going through any long mathematical process, state why you put that at 5 per cent? What is the reasoning in your mind that leads you to say 5 per cent?

A. Well, as a general rule, we have found out in our discharge measurements that the line which most nearly expresses the law of discharge will be so drawn upon a diagram that the extreme measurements, those which diverge furthest from the line, will contain an error not to exceed about 2 per cent. That in itself is probably an error that does not altogether measure the total error which appears in the measurement. It shows the internal or relative consistency of the measurements, but it does not exhibit the fact that it is possible that in addition to small errors due to the use of the meter itself, there may appear small errors due to the impossibility of measuring the cross section with absolute accuracy. And the final result will also show a very small error due to the slight errors of gage readings that may appear in the result. And while I have said 5 per cent, it is merely my opinion that the final result may show an error as large as 5 per cent. I do not believe it will show anything larger. I think all causes combined would probably aggregate at the very utmost 5 per cent."

In speaking of the error that may enter into the determination of an increment from the ice effects in these various outlet rivers, Major Keller stated (Vol. I, p. 240):

> "My conclusion, independently of that of this office, my personal conclusion is that the ice effect is a large but unknown factor in the determination of the levels of the Great Lakes; and that up to the present time the Lake Survey has not made sufficient measurements to enable any one to form a justifiable conclusion as to the measure of the ice effect, either in the St. Clair River, or in any of the other rivers; the Niagara or the St. Lawrence."

Prof. Eugene E. Haskell, one of the principal witnesses for appellee, in discussing an increment determined by the Lake Survey for the St. Clair River, said (Rec., Vol. V, p. 2735):

> "Q. The discharges would be in error 4% and the increment 40%?
>
> A. Yes."

Mr. Haskell invented the so-called Haskell current meter which was used in these determinations by the Lake Survey.

The witness F. G. Ray, who was when he testified the head of the United States Lake Survey, in speaking of the increment development for the St. Clair River, said (Vol. V, p. 2793):

> "I believe that increment may be in error from 10 to 15 per cent."

The witness Moore, in testifying as to the latest increments determined by the Lake Survey and in the employ of the Lake Survey, said (Rec., Vol. V, p. 2866, 2867):

> "I took up each of the rivers connecting the Great Lakes; examined all of the observations for possibilities of error, and made some changes and altera-

tions in gages and meter readings, which seemed indicated by the observations and by our further knowledge of the subject, and wherever necessary I derived new equations expressing the law of flow in terms of the controlling gage".

In speaking of the latest increment determined for the St. Clair River by the Lake Survey, Mr. Moore further said (Rec., Vol. V, pp. 2868, 2869):

> "The latest reduction by the Lake Survey shows an increment at mean stage of about 21,000 cubic feet per second. That, in my opinion, may possibly be in error by as much as 20 per cent."

Concerning the increment derived by the Lake Survey in 1909, Mr. Moore stated that the error was

"Not to exceed 25% maximum possible error."

Appellee has taken the position that the Secretary of War would have the authority to authorize a diversion from Lake Michigan of 4,167 seconds feet through the Chicago River, but would not have the authority to authorize 10,000 cubic seconds feet, or a diversion materially larger than the amount first mentioned, because in the first instance there would be no obstruction to navigation, but in the second instance there would be. When the conditions assumed for the second were apparent to the Secretary of War, his authority under Section 10 of the Act of 1899 ceased and would not cover an authorization of the larger diversion which would amount to, as they say, an obstruction. The Government's determination of the effect of 10,000 seconds feet diversion from Lake Michigan, is based upon an increment of approximately 23,800 cubic seconds feet. Dividing the diversion by the increment, to determine the effect, produces the result of 5 inches (approximately), which is the amount testified to and shown by Appellee's Exhibit 1. (Appellant's Narrative, opposite page 124.) If

there is 40% error in the increment, there may be 40% error in the determination of the effect—5 inches,—so that the 5 inches should be reduced by 40%, which would give a possible result of 3 inches as the effect of diversion of 10,000 cubic seconds feet at Chicago. This is a little over half an inch more than the effect of 4,167 second feet which appellee says does not create an obstruction to navigation, ascertained according to their determination of an increment of 23,820 cubic seconds feet.

Finally, appellant submits that for the determination of the magnitude of the effect of the Chicago diversion, the actual facts, *if established*, in the language of Mr. Justice Holmes, (*Missouri* v. *Illinois*, 200 U. S. 518, *et seq.*)

> "have required for their establishment the most ingenious experiments and for their interpretation the most subtle speculations of modern science. * * * There is nothing which can be detected by the unassisted senses. * * *"

The comments as to the qualifications of appellant's witness Gardner S. Williams, have been considered by us elsewhere. (*Infra*, p. 60.)

Appellee complains, (Its Brief 93), about our reference to the testimony of Mr. Ripley as to the platform of the Poe Lock being some four inches above the mitre sill. The Poe Lock being constructed about the year 1898, Mr. Ripley testified that the platform remained thus restricting the drafts of vessels from the time it was built until he testified in the year 1913. Appellee's particular complaint is that appellee's witness DeYoung was not mentioned in appellant's narrative statement, or in the index of the record appearing as Volume A. This index was prepared for the District Court, and was merely rebound for the use of this court. The DeYoung testimony was offered by appellee, on December 19, 1914,

after the record was printed and the index had been prepared. The following statement appears in the record at the time the DeYoung testimony was taken (Vol. VI, p. 3976):

> "Mr. Adcock: No; everything is in the printed record now."

The DeYoung evidence and some other evidence offered at that time, (December 19, 1914), was merely added to Vol. VI of the record. The index was not reprinted simply to include the additional material. So counsel's severe criticism in this respect is entirely unfounded. Furthermore, the DeYoung testimony was absolutely of no value. Ripley testified as to how the lock was built. DeYoung testified as to some soundings that were made, at which he was not present, as appears in his testimony, as follows (Rec., Vol. VI, p. 3979):

> "Q. Do you know the elevation of the top of this platform that you speak of as compared with the elevation of the top of the lower mitre sill of the Poe Lock.
>
> A. I don't think I do. I think, however, it is the same elevation.
>
> Q. That is only an opinion that you have?
>
> A. Yes.
>
> Q. You don't know anything about it?
>
> A. No, sir."

114 It was not until after both appellee and appellant had presented their evidence in chief, that appellee offered any evidence as to current in the Chicago River. In April, 1914, it produced certain persons who operated boats at times upon the Chicago River. (Rec., Vol. V, p. 3020.) These witnesses had never measured the current, nor had they made any calculations as to what the current would be from the cross sections and slope of the river produced by appellant's enlargement under the July 11, 1900, permits, with a flow of 10,000 cubic seconds feet.

They only testified as to what they thought they saw at certain places, at bridge draws and other parts of the river, when there were two or more boats abreast in the stream. The mile and a quarter per hour current, which was unobstructive to navigation, with the withdrawal of 10,000 cubic seconds feet through these river channels, was ascertained by competent engineers, (Randolph, *Infra*, p. 43, and Wisner, *Infra*, p. 62). Appellee's own division engineer at Chicago, in his report (1906) found that the current with this amount of diversion would not exceed a mile and a quarter an hour (*Infra*, p. 61.) No engineer of appellee appeared to testify that the channels of the Chicago River and its branches had not been completely so enlarged that the 10,000 cubic seconds feet of water could be taken through them without producing a current obstructive to navigation.

The Secretary of War, Stimson, in his statement of January 8, 1913, took up almost every question that could possibly be presented in support of his refusal to remove the limitation of December 5, 1901. He did not mention an obstructive current in the Chicago River that was or would be produced by the 10,000 cubic seconds feet diversion. He did not therein suggest that this diversion through those river channels had caused or would would cause any injury to navigation on that river. **If a current did or would exist in the improved channels of the Chicago River and its branches, the Secretary undoubtedly would have so stated in his January 8, 1913, statement.** In any event if there were any question as to whether a current is considered unreasonably obstructive to navigation, the river channels could be easily deepened to take care of this condition. The court, without difficulty, could properly, by its decree, take care of that situation.

We will now discuss the various points of appellee's argument.

APPELLEE'S POINT I.

(Its Brief, p. 123.)

It is true that these waters of the Great Lakes and their connecting channels, are navigable waters of the United States. The International Boundary passes through some of these lakes and along some of the connecting rivers. The waters on one side of the boundary are in Canada, and those on the other are in the United States. What counsel's purpose is in calling them "high seas", we are unable to discern.

The cases referred to by counsel, turned upon the proposition that they were navigable waters of the United States, and therefore admiralty courts had jurisdiction.

In referring to *The Genessee Chief* v. *Fitzhugh*, 12 Howard 443, this Court, *in U. S.* v. *Rogers*, 150 U. S. 247, 258, said:

> "The court, perceiving that the reason for the exercise of the jurisdiction did not in fact depend upon the tidal character of the waters, but upon their practicable navigability for the purposes of commerce, disregarded the test of tide water prevailing in England as inapplicable to our country with its vast extent of inland waters."

At page 259, the Court further said:

> "We may as appropriately designate the open, unenclosed waters of the lakes as the high seas of the lakes, as to designate similar waters of the ocean as the high seas of the ocean, or similar waters of the Mediterranean as the high seas of the Mediterranean."

The Boundary Waters Treaty of January 11, 1909, very clearly defines the character of these waters. Article I referred to by counsel, merely gives the same right of navigation to the citizens of Canada on Lake Michigan, that the United States has, "subject, however, to any laws and regulations of their country within its own territory."

The word "free" has a double meaning—one, "without toll", *second*, "equal" rights.

The preliminary article defines boundary waters. Lake Michigan is not a boundary water and therefore is not subject to the treaty; in fact, the treaty expressly recognizes and reserves to the State of Illinois and the United States, the free and unlimited power to deal with Lake Michigan as the United States and the State of Illinois may consider proper for the public interest. By the treaty, therefore, Lake Michigan may be treated as if it had no connection whatever with the other Great Lakes.

APPELLEE'S POINT II

(Its Brief, p. 128.)

In some mysterious way, not disclosed, appellee seeks to gain some advantage or comfort from calling the waters of the Great Lakes "international". Since the Treaty of January 11, 1909, with reference to Canadian boundary waters, the character of and the rights of the states and the nation in the waters of the Great Lakes, whether boundary or non-boundary waters, are not open to debate or question. Suffice it to say that the rights in Lake Michigan are recognized to exist in the state and nation. They may be diverted as the state or nation may provide, subject, only, to the right of Canadian citizens to sue for injuries, or the right of Canada to object in case navigation is affected as to any diversion not settled by the treaty. As we pointed out in our original brief, p. 188) the treaty left open the question *only* of a diversion at Chicago from Lake Michigan of that amount which would be in excess of 10,000 cubic seconds feet.

Counsel make two misstatements of fact in this connection—*first*, that the work on the canal and on the Sanitary District's diversion works, was not commenced prior to the passage of the Act of September 19, 1890, and, *second*, that the canal was not completed until after the passage of the March 3, 1889, Act. On this subject we refer the Court to the testimony of Mr. Lyman E. Cooley, who was the first chief engineer of appellant, and also was closely and intimately connected with appellant's projects from their inception (Appellant's Narrative, p. 288):

> "The Sanitary District was instituted for the specific purpose of carrying out the projects which were outlined prior to its organization, and had proceeded by September, 1890, in the definitive surveys from the Chicago River to Joliet. They had also instituted surveys on the

Chicago River with a view to the definitive surveys for its enlargement. When I became chief engineer in January, 1890, I proceeded immediately to further work upon those plans for the Sanitary District. There was nothing left to do except to define the things on the ground, practically. The genius of the whole proposition from the outset, held in mind unvaryingly, was to keep the flow of sewage away from Lake Michigan as far around the rim of the lake as was practicable."

Again, Mr. Cooley states, as to the date of the completion of the canal (Appellant's Narrative, p. 292):

"The work was proceeding faster than the District could get the funds to pay for it and so the real work on the channel, the Main Channel, which was scheduled to be completed in November, 1897, was not actually completed until about November, 1898, when it was substantially completed, and the District then notified the Governor of that fact and asked for the appointment of a commission. The first action by the Board (of Trustees of Appellant) on that matter was in November, 1898, and the petition actually was transmitted to the Governor in January, 1899, as I recall it."

Mr. Cooley is the only witness who testified to these facts. There was no controversy.

We construe the Act of September 19, 1890, as treating to be lawful appellant's structures erected under its May 29, 1889, Act, as held in

United States v. *Bellingham Bay Boom Co.*, 176 U. S. 211, 44 Law Edition, 437.

This case was construed in

Maine Water Company v. *Knickerbocker Steam Towage Company*, 99 Maine, 473,

as so holding, and the *Maine Water Company case* was cited with approval by this Court in

Southern Pacific Company v. *Olympian Dredging Company*, 260 U. S. 205, 210.

A distinction is sought to be drawn by appellee, because the waters affected by appellant's works built in exercise of Illinois' police power, affect other waters than those wholly within the limits of the state. Counsel fail to recognize the distinction between an act passed in the exercise of a well-known police power reserved to the state, as here, which act has a reasonable relation to the purpose sought, from an act of the state passed directly to regulate interstate commerce. In the first instance, the effect upon interstate commerce is *incidental,* and in the latter instance, it is *direct.* In the latter instance, the whole subject is delegated to Congress, and the states have no authority. In the first instance, the state's authority exists, and if the act is reasonable, then it must be reconciled with the congressional power or exercise thereunder. In the present instance, the state's acts operate upon navigable waters outside of the state, as claimed by appellee, and through that medium affect, incidentally, interstate commerce. In the ultimate analysis interstate commerce is the particular matter involved. The case is no different from a bridge constructed over the Chicago River, or some other river wholly within the state, which would have the result of affecting boats plying between some point further within the state, than the bridge erected, and ports of other states. It is similar to a regulation such as was before this Court in

Escanaba v. *Chicago,* 107 U. S. 678.

Interstate commerce outside of the state and generally is often incidentally affected through action under the state's police power. A good example is the discriminatory effect upon interstate commerce outside the State of Minnesota before this Court in the *Minnesota Rate Cases,* 230 U. S. 352.

The case of

Chandler-Dunbar Water Power Company v. *U. S.,* 229 U. S. 51.

does not support appellee's contention, for in that case the power plants were constructed in the St. Mary's River, and

produced the effect, as counsel claim, of lowering the levels of the lakes. They were lawful structures and so considered by appellee and every one until the Act of Congress was passed specifically declaring them to be unlawful, and directing the Secretary of War and Attorney General to remove them.

Kansas City Street Railway Co. v. *Kaw Valley Drainage Dist.*, 233 U. S. 75,

is not in point, for there the Court directed the *absolute* removal of a bridge over the stream in question, which bridge carried railroad tracks, an instrument of interstate commerce. This Court in that case based its decision upon the character of the decree directing complete removal. If there had been a proper order of the Court providing for *reasonable* alteration of the bridge, as required, to prevent overflow and damage to lands, then this Court's decision would have been different.

Appellee's Point II-A.

(Its Brief, p. 132.)

Appellee here again fails to recognize the distinction between acts of the state directly operating upon interstate commerce, from those acts which only incidentally affect it and passed in the exercise of a reserved police power. Counsel quote extensively from *Minnesota Rate Cases*, 230 U. S. 352, and lay much stress upon the language contained in that opinion

> "There is no room in our scheme of government for the assertion of state power in hostility to the authorized exercise of federal power."

In the case at bar, there is no exercise of state power in *hostility* to the federal power. The state proceeded in the best way possible regarding those things over which, under our scheme of government, it has jurisdiction. It has not sought to set up any power to regulate interstate commerce, and

this distinction is plain from the very language of the opinion quoted by appellee:

> "The grant in the Constitution of its own force, that is, without action by Congress, established the essential immunity of interstate commercial intercourse from the *direct control* of the states with respect to those subjects embraced within the grant * * *."

This Court, after using the language quoted by counsel, makes its position clear beyond question. Note the following language in the *Minnesota Rate cases*, which bears out our contention:

> (P. 402) "Our system of government is a practical adjustment by which the national authority as conferred by the Constitution is maintained in its full scope without unnecessary loss of local efficiency. Where the subject is peculiarly one of local concern, and from its nature belongs to the class with which the state appropriately deals in making reasonable provision for local needs, it cannot be regarded as left to the unrestrained will of individuals because Congress has not acted, although it may have such a relation to interstate commerce as to be within the reach of the Federal power. **In such case, Congress must be the judge of the necessity of Federal action.** Its paramount authority always enables it to intervene at its discretion for the complete and effective government of that which has been committed to its care, and, for this purpose and to this extent, in response to a conviction of national need, to displace local laws by substituting laws of its own. The successful working of our constitutional system has thus been made possible.
>
> * * *
>
> But this exercise of the important power to provide local improvements has not been regarded as constituting such a **direct burden** upon intercourse or interchange of traffic as to be repugnant to the Federal authority in its dormant state."

In speaking of quarantine regulations, this Court further said:

> (P. 406) "In view of the need of conforming such measures to local conditions, Congress from the begin-

ning has been content to leave the matter for the most part, notwithstanding its vast importance, to the states, and has repeatedly acquiesced in the enforcement of state laws."

This Court clearly recognizes that Congress should be deemed to have consented to the state's action in the exercise of a reserved police power, even though it indirectly affects interstate commerce, until Congress acts in the premises. So it did in the situation presented by the case of

Chandler-Dunbar Water Power Company v. *U. S.*, 229 U. S. 51.

A similar situation existed with reference to the diversions of water at Niagara Falls for water power purposes. These diversions existed without any congressional authority and without permits of the Secretary of War. The authority for such diversions existed solely under the laws of New York, until the passage of the Act for the preservation of Niagara Falls of June 29, 1906, at which time Congress exercised its paramount authority upon the particular subject. Counsel's quotation (Appellee's Brief, p. 221) from the committee report concerning the bill introduced, bears this statement out conclusively.

In

Covington & Cincinnati Bridge Co. v. *Kentucky*, 154 U. S. 204,

there was an attempt under state authority to fix rates of charge for passage over the bridge, a direct regulation of interstate commerce, and, of course, the case is not in point on the situation presented here.

This Court applied the same principle in

Missouri v. *Kansas Natural Gas Company*, 68 Law Edition, Advance Sheets, p. 585, June 16, 1924,

and in

Public Utilities Commission v. *Landon*, 249 U. S. 236.

In the former case, the Court held that the state was without power to fix the price of gas transmitted from one state to another, where the gas was delivered to a distributing company or companies, who thereupon delivered it to the individual consumer. In the *Missouri case,* this Court distinguished *Pennsylvania Gas Company* v. *Public Service Commission,* 252 U. S. 23, solely because the gas was transmitted from Pennsylvania by the Pennsylvania Gas Company to the individual consumer. In the *Pennsylvania Gas Company case,* the price fixed for gas under the authority of the State of New York, was the price to the individual consumer, and was peculiarly a local or state matter, and therefore it was held that the state's action should be reconciled and held valid. And in the *Missouri case,* this Court, making the distinction between the facts in that case and those in *Pennsylvania Gas Company* v. *Public Service Commission, supra,* said (587):

> "In such case the *local interest* is *paramount* and the interference with interstate commerce, if any, *indirect* and of minor importance."

Appellee's Point II-B.

(Appellee's Brief, p. 135.)

The cases cited under this subheading do not support the proposition presented, for the state's actions were upheld. The distinction attempted to be made by appellee does not exist. The situations presented by those cases were instances of the state's exercise of the reserved power, which indirectly affected interstate commerce. They are authorities in support of our position.

Appellee's Point II-C.

(Appellee's Brief, p. 136.)

It is unnecessary to consider the numerous cases cited by appellee as they support our contention. We will, however,

analyze the *Wheeling Bridge case,* 13 Howard 553, for the reason that counsel lay so much stress upon it as an authority in their favor. It is cited and the opinion is quoted at length under Point II-C of their argument (page 139), and also it is cited in almost twenty other places in appellee's brief. As we understand it, for that case, counsel contend the following: (1) it disposes of the contentions of appellant as to the invitation and acquiescence of appellee in the construction, operation and attendant diversion of appellant's works; (2) it disposes also of the contention of appellant that its works interfere, if at all, but slightly with interstate commerce; and (3) appellee further makes the claim that the Ordinance of 1787 as to the Northwest Territory has the same force and effect as the compact between Virginia and Kentucky as to the free navigation of the Ohio River, sanctioned by Congress, under consideration in this *Wheeling Bridge case.*

In order that these contentions of appellee may be shown to be fallacious, we will refer to the facts in the *Wheeling case,* which are entirely unlike the facts in the case at bar. The *Wheeling Bridge case* was instituted in this court by the State of Pennsylvania against the bridge company to enjoin the construction of a bridge across the Ohio River, which river at this point was entirely within the State of Virginia. The river, however, rose in Pennsylvania and extended through the State of Virginia, and thereupon formed the boundary between Ohio and Virginia and farther down between Kentucky and Ohio. This river in Virginia was entirely different from the Chicago River and its branches as they are wholly within the limits of the State of Illinois. The Chicago River and its branches do not stand to Illinois as the Ohio River at Wheeling did to the State of Virginia. However, as they connect with navigable waters outside the state, and navigation may be carried on continuously, the Chicago River and its branches are navigable waters of the United States and the facts are similar to those presented in *Willamette Iron Bridge Co.* v. *Hatch,* 125 U. S. 1. The Willamette River forms

with the Columbia River, a highway of interstate commerce. It is navigable water of the United States. It appeared that the purpose of building the bridge as proposed was to make Wheeling the head of navigation of the Ohio River, and thus cut off Pennsylvania towns.

Whether Congress would authorize the construction of the bridge across the Ohio River of the height and length of span, as it was being constructed, was before Congress on several occasions. Pennsylvania objected. Congress refused to pass any act authorizing the structure. Mr. Stanton, in his argument, summing up the effect of these applications to Congress, said (p. 528):

> "It is manifest, therefore, that the only constitutional power that could in any event authorize this bridge had been invoked, and that by its negative action, potentially as by express enactment, this structure was prohibited."

In the case at bar, the converse was true, for from the very beginning of the discussion of the project by the people of Chicago and Illinois, and from the time the Act of May 29, 1889, was passed, the entire matter had been brought to the attention of Congress by its own officers, and its inaction must necessarily be construed to be consent and acquiescence in Illinois' program for the protection of the public health of Chicago.

Pennsylvania instituted its suit immediately upon the initiation of the construction of the bridge. Notwithstanding the pendency of the suit, the bridge company proceeded to complete the structure in a manner to obstruct navigation. How much different are the facts before this court! Congress, long before the works of appellant were commenced to be built, provided for numerous surveys for a deep waterway. These acts covered a period of a quarter of a century prior to the passage of appellant's organic act. Surveys were made recommending the building of a deep waterway and the diversion of water from Lake Michigan for that purpose. After appel-

lant's works were placed under construction, and during the period of construction and afterwards Congress passed acts looking to the utilization of its canals and the water diversion for this deep waterway. At no time did Congress refuse to authorize their operation as required by the Illinois Act.

All of appellant's diversion works were constructed prior to the institution of any suit questioning the validity of its diversion; in fact, in the very suit to which appellee refers—the Calumet River suit, started on March 23, 1908,—as we pointed out in our original brief, appellee sought only to question the right to divert water through the Calumet River and the Calumet Sag Channel, a mere adjunct of the main diversion canal, the Sanitary and Ship Canal. The principal diversion provided for was through the Chicago River and its various branches to the northern terminus of the main canal. This Calumet River suit did not in any way question the right of appellant as to the Chicago River diversion, but assumed that to be a lawful diversion, as required by state law; otherwise appellee would have at that time included this diversion within the Calumet River suit.

This Court in the *Wheeling Bridge case* also based its decision upon the compact between Virginia and Kentucky, sanctioned by Congress—

> "That the use and navigation of the River Ohio, so far as the territory of the proposed state (Kentucky), or the territory that shall remain within the limits of this Commonwealth lies thereon, shall be free and common to the citizens of the United States."

This is entirely different from the provisions of the Ordinance of 1787 for the government of the Northwest Territory—

> "The navigable waters leading into the Mississippi and St. Lawrence, and the carrying places between the same, shall be common highways, and forever free, as well to the inhabitants of said territory as to the citizens of the United States, and those of any other states that may be admitted into the confederacy, without any tax, impost, or duty therefor."

In

Willamette Iron Bridge Co. v. *Hatch, supra,*

with reference to the effect of this provision of said ordinance, this Court said (page 2):

> "This court has held that when any new State was admitted into the Union from the Northwest Territory, the ordinance in question ceased to have any operative force in limiting its powers of legislation as compared with those possessed by the original States. On the admission of any such new State, it at once becomes entitled to and possessed all the rights of dominion and sovereignty which belong to them."

Again the Court said (page 12):

> "What the people of the old States wished to secure was the free use of the streams and carrying places in the Northwest Territory, as fully as it might be enjoyed by the inhabitants of that territory themselves, without any impost or discriminating burden."

Again this Court, in the *Willamette case* in speaking of the *Wheeling Bridge case*, said (page 15):

> "But in that case (*Wheeling Bridge case*) this court had original jurisdiction in consequence of a State being a party; and the complainant (the State of Pennsylvania) was entitled to invoke, and the court had power to apply, any law applicable to the case, whether state law, federal law or international law. * * * But Virginia, in consenting to the erection of Kentucky into a State, had entered into a compact with regard to the free navigation of the Ohio, confirmed by the Act of Congress admitting Kentucky into the Union, which the court held to be violated by authorizing the bridge to be constructed in the manner it was; and the bridge, so constructed, injuriously affected a supra-riparian State (Pennsylvania) bordering on the river, contrary to international law."

See also

Huse v. *Glover*, 119 U. S. 543.

In the late case of *Economy Light & Power Co.* v. *United States*, 256 U. S. 113, this Court, in referring to *Escanaba* v.

Chicago, 107 U. S. 678, 688, 689, and *Willamette Iron Bridge Co.* v. *Hatch*, 125 U. S. 1, and other cases, said (page 121):

> "Those cases simply hold, in effect, that a state formed out of a part of the Northwest Territory has the same power to regulate navigable waters within its borders that is possessed by other states of the Union; that is to say, until Congress intervenes, the power of the state, locally exerted, is plenary; nevertheless, where the navigation serves commerce among the states or with foreign nations, Congress has the supreme power when it chooses to act, and is not prevented, by anything the states may have done, from assuming entire control in the matter. In short, that the rule laid down in *Willson* v. *Black Bird Creek Marsh Co.*, 2 Pet. 245, 252, 7 L. Ed. 412, 414, and *Gilman* v. *Philadelphia*, 3 Wall. 713, 731, 18 L. Ed. 96, 101, applies to states formed out of the Northwest Territory as well as to others. This is not questioned."

As to the effect upon the commerce that would result by the construction of the Wheeling bridge, it appeared that the facts as to this question had been referred to a Master and found against the bridge company. Furthermore, the bridge was almost entirely constructed after Pennsylvania instituted the suit, so there were no equities in favor of the bridge company. Notwithstanding this fact, however, this Court suspended the operation of the decree giving the bridge company the opportunity to change its bridge as directed by this Court so that it would not unnecessarily obstruct navigation. This Court, in speaking of its action in the *Wheeling Bridge case*, said (*Willamette Iron Bridge Co.* v. *Hatch*, *supra*, page 16):

> "But to mitigate the apparent hardship of such decree, if executed unconditionally, the court, in the exercise of a merciful discretion, granted a stay of execution on condition that the bridge should be raised to a certain height, or have a draw put in it which would permit boats to pass at all stages of the navigation."

In

Miller v. *State of New York*, 109 U. S. 385,

it does not appear that the Act of Congress approving the plans of the bridge, was necessary, but this Court intimated

that without the congressional Act, its decision would have been the same, as the bridge was constructed under the authority of the State of New York at a time when Congress had not assumed any jurisdiction of such structures. And this Court cited

Gilman v. *Philadelphia*, 3 Wallace 713,

in which case a bridge over the Schuylkill River, Chestnut street, in the City of Philadelphia, connecting two parts of said city, was held to be a lawful structure, having only the legislative sanction of the State of Pennsylvania.

Appellee's Point II-D.

(Appellee's Brief, p. 151.)

Appellee cites

Economy Light & Power Company v. *United States*, 256 U. S. 113,

and seeks to argue that the Ordinance of 1787 of the Government of Northwest Territory, limits the action of Illinois the same way this Court held Virginia to be limited by the compact between Kentucky and Virginia, considered in that case. We have heretofore pointed out the distinction fully, and have shown that the Ordinance of 1787 was in no respect similar to the compact between Virginia and Kentucky mentioned.

Appellee's Point II-E.

(Its Brief, p. 154.)

Here counsel seek again to give some undisclosed effect to calling the waters of the Great Lakes "international." We will later discuss this subject more fully, where we deal completely with appellant's argument as to the force of the treaty (*Infra*, p. 85), as we believe the treaty fully disposes of all appellee's contentions.

APPELLEE'S POINT III.

(Its Brief, p. 159.)

At the outset, appellee's counsel seem to have forgotten the circumstances under which the Chicago River and its branches were enlarged. In construing Section 10 of the 1899 Act, it must be borne in mind that the Secretary of War was authorized only to do certain things. In the case of structures mentioned in said Act, he was empowered to approve the plans recommended by the Chief of Engineers. In the case of excavating or filling or altering or modifying the course or location, it was not to be done *"unless the work has been recommended by the Chief of Engineers and authorized by the Secretary of War prior to beginning the same,"* that is, the **work** of excavating or filling, or the **work** of altering or modifying. There was no authority for the Secretary of War to act, except under those conditions. We have pointed out that the work of excavating and filling and connecting the Sanitary and Ship Canal with the West Fork of the South Branch of the Chicago River, was authorized under the permits for the improvement of the Chicago River —the improvement beginning with July 3, 1896, permits, the more comprehensive improvement under the permits of July 11, 1900, and the permit of May 8, 1899, providing for the opening of the channel. As early as April 21, 1891, the Secretary of War was advised by being delivered a copy of the ordinance of that date adopted by the board of trustees of appellant, expressly stating its purpose *"to make"* the Chicago River and its branches *"a proper and sufficient supply channel for the Main Channel heretofore surveyed from the Chicago River to Joliet."* (Appellant's Narrative, p. 454.) In the application for the permit of July 3, 1896, which was the initial one for the improvement of the Chicago River, it was stated that appellant's work had prog-

ressed so far that it was necessary to enter upon that which should be done to make the Sanitary and Ship Canal available. The purpose of the work was disclosed. The same was true of the applications for the permits of July 11, 1900, under which the Chicago River was finally improved for the increased diversion—10,000 cubic seconds feet.

Appellee's counsel are in error when they state in substance that there was nothing done prior to March 3, 1899, by appellant "affecting in the slightest any navigable waters of the United States, except the accomplishing of certain improvements in the Chicago River." (Appellee's Brief, p. 160.) The excavations in the channels of the Chicago River were not mere boyish pranks of appellant. They were serious acts in the interest of the public health. The purpose was well known to the government officers, for they had been definitely advised. Mr. Lyman E. Cooley testified with reference to these improvements in the Chicago River and its branches (Appellant's Narrative, p. 294):

> "The improvement made prior to the opening of the channel was simply preliminary improvement. It was recognized that in order to obtain this flow in the quickest possible time and at the lowest possible expense, that there would have to be a wholesale improvement, such as was undertaken in 1900.
>
> * * *
>
> The Chief Engineer of the District went ahead and made an exhaustive survey of the Chicago River from Robey street to the lake, defining all property rights and cross sections of the stream, with a view to definitive plans for the improvement of the river. And these surveys were completed prior to 1895. They were followed by definite plans for the improvement of the river, which were inaugurated in 1896, in co-operation with the United States, which made an appropriation for the improvement of the river in that year; and the river was improved to a depth of twenty feet by dredging the stream. And the bad angles in the stream were cut off, and in some places the river was widened, and in the vicinity of Adams street and Jackson street, by-passes were con-

structed at the constricted parts of the river, in that vicinity, for the purpose of giving the preliminary flow required by the Sanitary District law of 300,000 cubic feet at the velocity of one and one-fourth miles per hour.

These surveys were also used as the basis of the larger improvement which was immediately defined and inaugurated after the opening of the channel in 1900, for a capacity of 10,000 feet per second.

That plan consisted in bascule bridges in the stream of a uniform width of 200 feet, and a central depth of twenty-six feet; and has also been carried out in part with the co-operation of the United States.

The capacity of the Main Channel at the Rock Section was actually 840,000 cubic feet per minute.

The occasion for making further improvement in the Chicago River and its branches after 1900, by the Sanitary District, was to get the increased capacity which was required with the growth of population, after the initial capacity of 300,000 feet had been established, and to accommodate 600,000 feet by way of the Chicago River, and later that was supplemented by the flow by way of the 39th Street conduit.

That new improvement or the improvement after 1900 was known as the Chicago River Improvement Project of 1900.

If the flow through the Sanitary District Canal had been limited to 5,000 cubic feet per second after 1900, it would not have been necessary for the Sanitary District to have made the changes and alterations in the Chicago River that it subsequently did make after 1900."

Again, speaking of the improvement of the Chicago River and its branches, Mr. Cooley stated (Appellant's Narrative, p. 299):

"The Chicago River prior to this improvement was little more than an adaptation of the Chicago Creek, which was known before Chicago was here; and its capacity for carrying a flow of water was limited. It is difficult to make a comparison where the stream was so little adapted to the present purpose, and where the change has been so radical.

Originally the Chicago Creek carried twelve feet up to the Forks, and its original improvement, the first im-

provement, was based on a depth of thirteen feet, which was subsequently increased to sixteen, and the tunnels built under the river limited the use of the Chicago River to sixteen feet, until they were removed within a comparatively recent period. They were removed by the city at a very considerable cost, which should be added to the expenditure of the Sanitary District and the United States, in getting at the true cost of the improvement of the Chicago River.

When the Sanitary District entered upon the improvement of the Chicago River, it was approximately sixteen feet in depth.

The depth has been increased to approximately twenty-six feet, and that is the depth carried through the main channel, to the power house.

There were portions of the river that would run up to 200 feet and even 300 feet in width, and again other portions that were less than 100. The narrow portions have been widened, or are being widened, except a very limited area near the Pennsylvania Central Station, which has been greatly delayed.

It has been widened to a large extent throughout its entire length, the Chicago River and the South Branch, so much so that it could almost be considered a new river."

Mr. Isham Randolph, who was Chief Engineer of appellant at the time the comprehensive improvement of the Chicago River for the larger diversion was laid out and, also, during a considerable period of the channel enlargement, stated (Rec. Vol. VI, p. 3593, *et seq*):

"Q. Did you have anything to do with the so-called project of 1900, for the improvement of the Chicago River, and with the preparation of the plans for that project?

A. It was my project, and the plans were prepared under my direction.

Q. Were those plans submitted to the Secretary of War and Chief of Engineers, and approved by him?

A. Yes, sir.

Q. What did you take into consideration in determining the plans for that improvement?

A. I took into consideration that we wanted to pass through the main river, through the South Branch of the Chicago River as far as the Stock Yards Branch 480,000 cubic feet a minute.

Q. That would be about 8,000 cubic feet per second?

A. 8,000 cubic feet per second. We wanted to take in through the 39th street conduit 2,000 cubic feet per second, 120,000 a minute, making a total of 10,000 cubic feet from the junction of the Stock Yards Branch with the main river.

Q. Did you take into consideration what the mean current would be through the Chicago River and the South Branch and West Fork?

A. I figured it on the basis of a shade under a mile and a quarter an hour, except in bridge openings where it was slightly contracted.

Q. That was the current which the Secretary of War considered proper for navigation purposes, was it, at that time?

A. Yes, sir.

Q. Now there were some modifications of the May 8th, 1899, permit, whereby the flow of water was limited. After about 1902, did you as Chief Engineer attempt to keep the flow within the limits of the permit as stated by the Secretary of War?

A. Up to June, 1902. I conformed fairly well to those figures. After that we exceeded them, and paid very little attention to that from that time on.

Q. That is in 1902, improvements were made in the Chicago River so as to create a greater cross section for the flow of water?

A. In that year we excavated 600,000 cubic yards of earth from the river and we built 4,700 feet of new dock. The narrowest place in the river was beyond 22nd street. It was only 115 feet wide, and we enlarged that to 200 feet; 26 foot, mid-channel depth.

Q. In other words those improvements were such that a current would not be created of more than a mile and a quarter an hour with a flow exceeding the limitations which had been indicated by the Secretary of War?

A. That was true, wherever our channel was completed. There were some few narrow spots where the current still exceeded that.

Q. There were not very many of those places?
A. And not very serious.
Q. Rather immaterial, were they?
A. Yes, sir."

Wisner's Exhibits 7, 8, 9, 10 and 11 (Appellant's Narrative, opposite page 393) show the extent of these improvements in the Chicago River under the so-called 1900 project to accommodate the greater diversion. In speaking of the tunnels under the Chicago River, removed by direction of Congress in connection with this river widening and at the suit of the City of Chicago, Mr. Wisner stated (Appellant's Narrative, p. 399):

> "This prevented the deepening of the river for some time, as the top of the channel was about, as I remember, 20 feet below the surface, 20 or 21 feet below datum."

The same was true of the channel at LaSalle Street, under the main river.

As stated by the witnesses, it is obvious that it was necessary to deepen and widen the channels of these rivers, so that the necessary volume of water could be drawn through them to the Sanitary and Ship Canal. Appellee's counsel attempt to belittle this statement. It is plainly evident, according to the laws of gravity. Anyway, there is no dispute about it in this record, as there is no evidence contrary to appellant's witnesses.

In

West Chicago Street Railway Company v. *Chicago*,
201 U. S. 505,

cooperation of the Federal Government appears by the records of this Court. The Chicago River proper was deepened at the expense of the United States to conform to the deepening of the South Branch and West Fork by the appellant. The government's work was thus done in cooperation with appellant and the City of Chicago. The City of

Chicago, to remove the tunnels in order to provide this depth, by ordinance found the tunnels to be obstructions to navigation, and directed their removal. The Rivers and Harbors Act of March 3, 1899, the very act under which appellant is seeking to limit the diversion, contained the following item:

> "Improving Chicago river in Illinois: Survey and estimate of cost for a channel twenty-one feet deep from its mouth to the stock yards on the south branch, and to Belmont avenue, on the north branch, so far as may be permitted by existing docks and wharves, exclusive of cost of removing or constructing bridges or piers or lowering tunnels; and the aforesaid depth of twenty-one feet is hereby adopted as the project depth for the improvement in lieu of that fixed by the act of June third, eighteen hundred and ninety-six (29 Stat. at L. 202, chap. 314): *Provided,* That all the work of removing and reconstructing bridges and piers and lowering tunnels necessary to permit a practicable channel with said depth to be obtained shall be done, or caused to be done, by the city of Chicago, without expense to the United States."
>
> 30 Stat. at L. 1156, Chap. 425,
> *West Chicago Street Railway Company* v. *Chicago, supra,* 516.

Other acts of Congress and facts bearing upon this matter are set forth herein. (*Infra,* pp. 104-110.)

So it is apparent that even before the appellant's Sanitary and Ship Canal was opened, Congress had been advised of the project for comprehensively deepening and widening the Chicago River to make it of depth for the withdrawal of water through it as required by the state law and for navigation purposes, and that Congress sought to cooperate in this improvement. And this Court, in

West Chicago Street Railway Company, supra,

held that it was unnecessary to obtain the permit of the Secretary of War, as the Congressional Act, above quoted

(p. 527), "*meant to give the assent of the United States to any work done by the city towards accomplishing the end which the government had in view.*" If a permit of the Secretary of War were unnecessary in that instance, it was equally unnecessary so far as the Sanitary District's improvement of the Chicago River was concerned, and the use thereof resulting from such deepening and widening. **Congress itself had expressly approved these works.**

Appellee's counsel state (Appellee's Brief, p. 161):

> "The mere excavation of a ditch in the interior of a city, is of no concern to the Federal Government."

They are speaking of the Sanitary and Ship Canal, completed the latter part of the year 1898. The same position, however, was not taken as to the Calumet Sag Channel. As soon as construction on that channel was started, the Calumet River suit was commenced, March 23, 1908.

Appellee's Point III-A.

(Appellee's Brief, p. 163.)

It is difficult to tell at what counsel are driving. We do not disagree with counsel, so far as this record is concerned, that when Congress seeks to act in making complete and full regulation of all subjects whereby navigable waters may be affected, it may do so. Whether an act of Congress in effect excluding the state's exercise of police power on this subject would be constitutional, is not now before this Court. We say that Congress has not by any act, in those plain and unmistakable terms necessary to express its will, intended to delegate to the Secretary of War power to regulate diversions from Lake Michigan by appellant for sanitary purposes.

Appellee's Point III-B.

(Appellee's Brief, p. 164.)

Counsel here quote at length from
United States v. *Rio Grande Dam & Irrigation Co.*,
174 U. S. 690.

There was no consent of the Secretary of War for the diversion of the head waters of the Rio Grande River for irrigation purposes. The diversion contemplated by this dam would accomplish the taking of substantially all the waters of the river at the point where the dam was to be constructed. The Court said (p. 709):

> "It does not follow that the courts would be justified in sustaining any proceeding by the attorney general to restrain any appropriation of the upper waters of a navigable stream. The question always is one of fact, whether such appropriation substantially interferes with the navigable capacity within the limits where navigation is a recognized fact."

There is no allegation in the bill in the main channel suit that the diversion of water in excess of 4,167 seconds feet substantially or materially interferes with the navigable capacity of any of the waters of the United States; nor is there any allegation that there is or will be a material injury to interstate commerce by said diversion. The case is not an authority to the effect that appellant required more for the building of its Sanitary and Ship Canal than the authorization by the State of Illinois, for the Act of Illinois amounted to an authorization by law of any obstruction to navigable waters of the United States resulting from carrying out the provisions of said Act. This Court said, in the *Rio Grande Dam & Irrigation Co. case* (p. 703):

> "The power of the State to thus legislate for the interests of its own citizens is conceded, and until in some way Congress asserts its superior power, and the

necessity of preserving the general interests of the people of all the states, it is assumed that state action, although involving temporarily an obstruction to the free navigability of a stream, is not subject to challenge."

The Act of March 3, 1899, does not help counsel. That Act was prospective in its operation, for it refers to things thereafter to be done. Appellant's canal was then built. This reasoning is supported by the language in Section 18 of the March 3, 1899, Act, where it gives the Secretary of War jurisdiction to cause the alteration of a bridge *"now constructed or which may hereafter be constructed."* If it had been the intention of Congress that Section 10 should apply to structures theretofore constructed, Congress would obviously have clearly stated its intention, as it did in Section 18 in relation to bridges.

In *Economy Light & Power Co.* v. *United States*, 256 U. S. 113 (Appellee's Brief, p. 167), the dam across the Desplaines River, under construction when the suit was instituted, had neither state nor federal sanction. The Secretary of War had not given his assent and the State of Illinois had in no way authorized it. The only question involved was whether the Desplaines River was a navigable water of the United States. If it were found to be such, as the Court did conclude, then obviously the authority did not exist in the Economy Company to build the dam. *Cummings* v. *Chicago*, 188 U. S. 410.

Southern Pacific Co. v. *Olympian Dredging Co.*, 260 U. S. 205 (Appellee's Brief, p. 168) related to the construction of a bridge over the Sacramento River. The structure was specifically mentioned in the 1899 Act. The same is true of the dam mentioned in the *Economy case*. This Court stated that the Congressional legislation of 1899 committed to the Secretary of War *"administrative power in so far as administration was necessary."* There is no suggestion that such act committed to the Secretary of War power to

regulate the state's action, such as, the diversion of water from Lake Michigan under the state's police power and in the interest of the public health, or in connection with the improvement and maintenance of its waterways. These broad questions were left to the states to solve according to the judgment of their legislative bodies—always with the understanding that Congress might exercise its dormant power in case the state's action was not in keeping with its plans and purposes.

Appellee's Point III-C.

(Appellee's Brief, p. 168.)

Counsel say (Appellee's Brief 169):

> "That the words 'affirmatively authorized by law' did not cover the obstruction caused within the state but affecting the navigable capacity of waters outside the state is clear from the opinion of this Court in *United States* v. *Rio Grande Dam & Irrigation Co.*, 174 U. S. 698."

This is obviously a misstatement of the holding in that case. In the first place, New Mexico was a territory, and in the second place there was no authorization for the construction of the dam by the Secretary of War under the 1890 Act. Had the latter existed, as the Court held, the dam would have been considered to be a lawful structure. The fact that navigable waters outside the state would be affected did not enter into the decision of that case, so far as legislative and administrative authority was concerned. A *non sequitur* follows when counsel state (Appellee's Brief, p. 169).

> "There is, therefore, no doubt as to the meaning and intent of the words 'affirmatively authorized by Congress' as they appear in Section 10 of the Act of 1899."

Cummings v. *Chicago*, 188 U. S. 410, and *Montgomery* v. *Portland*, 190 U. S. 89, cited by appellee (Appellee's Brief,

pp. 203, 204) merely hold that as to the particular structures named in Section 10 of the 1899 Act, state action was necessary to authorize their construction. Also, these cases hold that when the Secretary of War authorized same, pursuant to the recommendation of the Chief of Engineers, they were lawful structures. We argue from those cases that the only legislative action required under either the 1890 Act or the 1899 Act was appellant's organic act of the General Assembly of Illinois, May 29, 1889. No legislative authority by Congress was required. The work of excavating and filling, and the work of altering or modifying the navigable waters of the Chicago River and its branches, which would result, as appellee claims, in the altering or modifying of other navigable waters of the United States, was authorized by the Secretary of War under the various permits mentioned. Even Congress had assented to it by the Act of March 3, 1899, mentioned in the case of

West Chicago Street R. R. Co. v. *Chicago*, 201 U. S. 505.

See also other acts of Congress mentioned herein. (*Infra*, pp. 104-110.)

So in

United States v. *Rio Grande Dam & Irrigation Co.*, 174 U. S. 690,

had the Secretary of War authorized the construction of the dam or approved the plans therefor, as recommended by the Chief of Engineers, this Court would have refused to reverse the case and would have held the dam, when constructed, to be a lawful structure.

We are sorry that counsel were unable to see the application of *International Bridge* v. *New York*, 254 U. S. 126, (Appellant's Original Brief, p. 181, Appellee's Brief, p. 172) for it was claimed that because it was an international bridge, Congress had

> "assumed such control of it as to exclude any intermeddling by the state."

International commerce was carried on over this bridge. Even that fact did not move this Court to exclude the state from the exercise of those powers reserved to it, though this did affect the operation and maintenance of the international bridge.

Appellee's Point III-D.

(Appellee's Brief, p. 174.)

Counsel again fail to give any consideration to the purpose and effect of the permits for the enlargement of the channels of the Chicago River and its branches. There never was any question as to why the river channels were to be widened and deepened. The Act expressly provided how much water should be diverted from Lake Michigan. The ordinance of appellant and requests for permits stated the purpose of deepening and widening the Chicago River to make it a supply channel connecting Lake Michigan with the northern terminus of the Sanitary and Ship Canal, through which the necessary amount of water could be withdrawn. By some process of reasoning, appellee here claims that an authorization by the Secretary of War upon the recommendation of the Chief of Engineers for the work of excavating and filling to accomplish the withdrawal from Lake Michigan of 10,000 seconds feet would be invalid, and beyond the power of the Secretary of War. At the same time, counsel maintain that the so-called authorized diversion of 4,167 cubic seconds feet is lawful. In other words, while the Secretary of War is delegated the authority of determining what work he will authorize on the recommendation of the Chief of Engineers, yet if he should err in his judgment, to the extent that such work would cause an obstruction to navigation, then his authorization would be invalid. We presume that counsel are endeavoring here to meet our proposition that the July 11, 1900, permits, in authorizing the

work of excavating and filling in the Chicago River and its branches, approved the diversion resulting therefrom. Counsel further, in their reasoning, assume that the diversions resulting from this work so authorized under the July 11, 1900, permits, have obstructed navigation. Therefore, as they say, the Attorney General, acting under the supposed authority of Section 12, would have the power, if he believed, or somebody told him, or in some other way he came to the conclusion, that the diversion was an obstruction, to proceed by injunction to restrain its continuance. According to counsel's contention, when the Secretary of War reaches the conclusion that a proposed structure, or proposed work of excavating or filling, will amount to an obstruction, his power ceases. An authorization approving the plans of such structure, or authorizing the work, would be of no force. This is certainly not the correct construction of Section 10. The Secretary of War, by authorizing the work of excavating or filling, found, so far as the United States is concerned, that such work, and the results thereof, are not obstructions to navigation.

Congress has authorized the Secretary of War to approve plans of bridges, and to authorize work of excavating, etc., as recommended by the Chief of Engineers, and when such plans have been approved, and a bridge is constructed thereunder, and excavation is done, according to the plans, the bridge is a lawful structure, and the work and the results thereof are lawful, even though navigation is obstructed. The Secretary of War is the arm of Congress in this respect, and the situation is not unlike that presented in the second *Wheeling Bridge Case*, 18 Howard 421.

Congress declared that bridge a lawful structure, which this Court had theretofore found to be an obstruction to navigation. This Court held the Congressional Act valid.

Counsel again (their brief, p. 178), indicate that they consider the acts of appellant in deepening and widening the

Chicago River, rebuilding bridges at an expense of upwards of $10,000,000, as merely the cavortings of a child. For what purpose did appellant make this vast improvement, all of which was authorized by the Secretary of War? As stated by Mr. Cooley (*Infra*, p. 42), there was no occasion for deepening the Chicago River from seventeen to twenty-six feet, and widening it at all points to 200 feet, if appellant were to be confined to the 4,167 seconds feet diversion. True, it would have been possible for appellant to have closed the bear trap dam at the southern terminus of the Sanitary and Ship Canal and operated it after the channels of the Chicago River and its branches were excavated for the larger diversion, if it by law could have done so. The situation is just the same as if there were no controlling works at the southern terminus of the Sanitary and Ship Canal, for appellant was mandatorially directed by the state law to build a canal of not less than 10,000 cubic seconds feet in capacity, and to maintain a flow through it to the amount of 20,000 cubic feet per minute for each 100,000 of population. (Sections 23 and 20, Act May 29, 1889, Appellant's Narrative, pp. 71-72.) So when the excavation in the channels of the Chicago River and its branches was made, it was compelled by law to so operate its channel and its controlling works, that that amount of water would be withdrawn.

Furthermore, under Section 21 of its organic act, (Appellant's Narrative, p. 71) appellant could have been forced by action of the Attorney General of Illinois or the State's Attorney of any county along the Desplaines and Illinois Rivers, to so operate its canal by withdrawing from Lake Michigan the larger diversion, as contemplated by the work authorized under the permits of July 11, 1900.

Counsel quote at length from

Hubbard v. *Fort*, 188 Fed. 987,

and rely upon it in support of their construction of Section 10 of the 1899 Act. As we stated in our original brief, (p.

138) *Hubbard* v. *Fort, supra,* is contrary to the case upon which we rely, *Maine Water Company* v. *Knickerbocker Steam Towage Company,* 99 Me. 473. The latter case was cited, as before stated, with approval by this Court. (Our original brief, p. 139.) So far as we are able to ascertain, *Hubbard* v. *Fort* has never been even cited by any Federal Court. In addition, the *Maine Water Company* v. *Knickerbocker Steam Towage Company case, supra,* has been cited with approval in

Garrison v. *Greenleaf Johnson Lumber Co.,* 215 Fed. 576, 580 (C. C. A. 4th).

Counsel fail to understand the dissections of the 1899 and 1890 Acts made by us (our original brief, pp. 133-136.) We assumed that counsel would find this dissection convenient, in elaborating the analysis made by the Court in the *Maine Water Company case.*

Appellee's Point III-E.

(Its Brief, p. 181.)

Many cases are cited, among others, *United States* v. *Chandler-Dunbar Water Company,* 229 U. S. 51. We are not here concerned with the question whether Congress may exercise paramount control over the Chicago diversion. It has not done so. Until it acts, the diversion is lawful. This the Court held to be the law in the *Chandler-Dunbar case, supra.*

Appellee's Point III-F.

(Its Brief, p. 184.)

At the outset, counsel say (their brief, p. 184):

"It will be recalled at the very outset, in granting the permit of May 8, 1899, the Secretary of War entertained grave doubt as to his power to authorize the diversion

of water by appellant. This was the reason for the incorporation of the first condition in that permit, namely, that it should 'be subject to such action as may be taken by Congress.'"

How counsel can reach this conclusion from the facts and circumstances of this case, is difficult to even guess. The Secretary of War undoubtedly advised by the Judge Advocate General, concluded that the Illinois Act of May 29, 1889, was sufficient legislative authority that the exercise by the state of its reserved police power, was lawful until Congress acted. In order that there might be no question, the Secretary of War inserted the condition 1 referred to, as to Congress's future action, which was and is the law anyway.

In refusing to issue the permit for the reversal of the flow of the Calumet River, Honorable William Howard Taft, then Secretary of War, issued a memorandum which contained the following statement (Appellant's Narrative, p. 79):

"The application of the Sanitary District is for leave to reverse the flow in the Calumet River in such a way as to make the water to flow out of the lake instead of to flow into it and to discharge the water from the Calumet River into the Drainage Canal. The Chief of Engineers was at first of opinion that such a change in the flow of the river *it* was not within the power of the Chief of Engineers to recommend, or within the power of the Secretary of War to permit. This expression of opinion as to the construction of the statute was submitted to the Judge Advocate General, who holds that Section 10, as quoted above, applies to this case and that it is one in which work could be allowed under the recommendation of the Chief of Engineers and the permission of the Secretary of War. Upon the construction of the Judge Advocate General I requested the Chief of Engineers to make his recommendation. * * * Between two such great interests, the decision must be affected more or less by large public policy and expediency, and while I agree in the construction of the Judge Advocate General that the issue is left by statutes to the recommendation of the Chief of Engineers and the concurrent deci-

sion of the Secretary of War, it may be fortunate that circumstances now require submission of this question of capital and national importance to the Congress of the United States."

The effect of the so-called decision of Secretary of War, Stimson, of May 8, 1913, has been fully discussed in our original brief (pp. 205, 206). Counsel have made no new points, and it is unnecessary to reiterate our argument there made.

APPELLEE'S POINT IV.

(Its Brief, p. 189.)

Appelle's counsel here, in their preliminary argument under Point IV, assume, which is not a fact, that appellant in diverting the waters of Lake Michigan to the amount of 10,000 cubic seconds feet, is violating Section 10 of the Act of 1899. They assume that Section 10 of that Act covers the Chicago diversion, and that the Secretary of War has not authorized the work necessary to accomplish the diversion, and has not, therefore, authorized the diversion itself. They say (Appellee's Brief, p. 190) that the amount as compared with the flow of other streams and with the flow of the outlet rivers, necessarily shows that an obstruction to navigation exists. Some mention is made (Appellee's Brief, p. 190) that

> "appellant made no effort to rebut the testimony of appellee's witnesses on this subject, all men of experience and standing",

in the Calumet River suit. The fact is that the Calumet River suit was consolidated with the Main Channel suit instituted on October 6, 1913, and all testimony taken in the first suit was treated as if taken in the second suit, so far as such evidence was material. Many witnesses were produced by appellant who testified as to the inaccuracy of appellee's deductions. The statements of the Chief of Engineers, of the Officers of the United States Lake Survey and of the International Waterways Commission as to the amount of the lowering of the levels of the Great Lakes due to a diversion at Chicago, were the conclusions reached in the same way that similar conclusions were testified to by appellee's experts in this case.

Appellee's counsel mention the statement of appellant's Chief Engineer before the Secretary of War,—that he did not desire

> "to question the accuracy of the figures or the fairness of the calculations—* * *"

This statement was made for the purpose of the hearing before the Secretary of War upon the application of appellant that the Secretary of War remove the limitation of December 5, 1901, due to the fact that the Chicago River had been then improved under the Secretary of War's permits of July 11, 1900. (Rec. Vol. VI, p. 3701.) The above statement of the Chief Engineer of appellant immediately succeeded the following sentence:

> "If all the theories can be relied upon, the observations are accurate, and calculations fairly made, it is probable that such a diversion would be theoretically determined as affecting the level of Lake Michigan to the extent of about five inches."

Obviously, the statement of appellant's Chief Engineer referred to by appellee's counsel, was intended to be made only for the purpose of the proceeding before the Secretary of War. That is, he did not wish to go into a complicated analyzation of the conclusions of appellee's officers on this subject. Previously, the Chief Engineer in his statement (Rec., Vol. VI, p. 3696), in referring to the calculations made, said:

> "To indicate the different results obtained, attention may be called to the estimates given in the report upon the Chicago Drainage Canal by the International Waterways Commission (1907), page 7, wherein the effect of the withdrawal of 10,000 cubic feet from Lake Michigan at Chicago upon the St. Lawrence River at Rapide Plat is stated as four-tenths of a foot. This is approximately 4¾ inches.
>
> The brief submitted by the Dominion of Canada, to which is affixed the signature of the engineers who prepared the data therein contained, gives the effect at the same point, of the same diversion, as 6.8 inches. This is a difference of nearly 50 per cent. and is a fair indication of the lack of accuracy with which compilations can be made as to the effect of a diversion from a given body of water. Generally no two engineers figuring upon this effect arrive at the same result. This is to be expected by reason of the unknown quantities entering into the computation, and also because in making the computation

the data obtained by the Lake Survey cannot all be used, and the results must vary according to the data that may be utilized."

Counsel refer to appellant's principal hydraulic witness, we presume Mr. Gardner S. Williams. Mr. Williams thoroughly analyzed appellee's witnesses' statements as to the effect upon the lakes. He was competent to do so. His qualifications were of the highest, having been for many years engaged in work where calculation of the flow of water was required. He was for a considerable time Professor of Engineering at Cornell University. Later, for a number of years, he was Professor of Engineering at the University of Michigan, and had been engaged also in private consulting engineering practice of great magnitude. (Appellant's Narrative, p. 134.)

Appellant's other witnesses, on the hydraulics of the Great Lakes, corroborated Mr. Williams' calculations. They reached the conclusion, as stated in the statement of the case (our original brief, p. 63) that the observations made by appellee's witnesses as to the discharge of the different outlet rivers of the lakes were not sufficiently accurate to entitle any definite conclusions to be reached as to the effect of a diversion of 10,000 cubic seconds feet at Chicago; that there were many elements entering into the processes by which appellee's witnesses reached the conclusions as to the lowering effect, which would necessarily cause inaccurate results.

Mr. Williams merely stated on cross examination, (Appellant's Narrative, p. 141) that from his study of the conclusions of appellee's witnesses, that the lowering could not be over 4.1 inches for Lakes Michigan-Huron, assuming 10,000 cubic seconds feet diversion.

We have pointed out the inaccuracy of appellee's conclusions as to the evidence concerning injury and damage to commerce on the subject of appellee's statement of the case (Appellant's Brief, p. 65.)

Finally, appellee refers to a current in the Chicago River, as follows (Appellee's Brief, p. 192):

> "We do not believe that appellant will gain-say that it has created and is maintaining a current of a greater rapidity."

The inaccuracy of this statement is clearly refuted by the report of May 22, 1906, of Col. William H. Bixby, U. S. Engineer at Chicago, later Chief of Engineers, entitled:

> "Effect of withdrawal of water from Lake Michigan by the Sanitary District of Chicago".

As to the rate of flow in the Chicago River that would exist after the work of deepening and widening the river under the July 11, 1900, permits, was completed, he stated (Rec., Vol. IV, p. 2397b):

> "17. In the capacity of sewer to properly carry off all the diluted sewage which the sanitary district must dispose of in the future, the South Branch and West Fork of Chicago River and the district drainage canal will need the use of the full cross section now being given to them at their typical points of construction, viz., 4,700 square feet in South Branch, Chicago River, where a future 8,000 cubic feet per second is now asked for; 5,200 square feet in West Fork, South Branch, Chicago River, 5,412 square feet in the earth sections and 3,542 square feet in the rock sections of the drainage canal, for all of which 10,000 cubic feet per second is now asked for; and 5,412 square feet in the lower (south) end of the drainage canal, where 14,000 cubic feet per second is now being asked for. I assume that after this volume of water reaches the Des Plaines and Illinois rivers it can be taken care of more easily than in the Chicago River and that the 2,800 square feet cross section of the proposed 14-foot waterway, now under consideration by Congress, will be supplemented sufficiently by the rest of the natural river on each side of the improved boat channel. The above cross-sections, so long as no boats lie at wharves or pass up and down the river, will allow the passage of the 8,000 cubic feet per second through the South Branch, with average velocities of not exceeding about 1.2 miles per hour (1.7 linear feet per second); 10,000 cubic feet through the West Fork, with average velocities of not exceeding about

1.3 miles per hour (1.9 linear feet per second), and the same flow through the earth sections of canal at not exceeding 1.2 miles per hour (1.8 linear feet per second), and through the rock section of canal at not exceeding 1.9 miles per hour (2.8 linear feet per second); and 14,000 cubic feet through the lower end of canal at not exceeding 1.8 miles per hour (2.6 linear feet per second.)"

In conclusion, Colonel Bixby stated in this report (Rec., Vol. IV, p. 2397d), as follows:

"25. Summing up the above it may be briefly stated, therefore, that 10,000 cubic feet per second diversion of water from Lake Michigan into the drainage canal will be, probably, not unreasonably obstructive to navigation and injurious to property if divided up into 6,000 cubic feet per second through the main river and south branch, increased by 2,000 cubic feet per second more through the Thirty-ninth street sewer and 2,000 cubic feet per second more through Calumet River (10,000 cubic feet per second in all), but that an increase in these amounts to 8,000, 2,000, and 4,000 cubic feet, respectively (14,000 cubic feet per second in all), will probably prove to be unreasonably obstructive and injurious."

Appellant's witness, George M. Wisner, testified as to the current in the Chicago River with a diversion of 10,000 seconds feet and with the Chicago River deepened and widened under the permits of the Secretary of War of July 11, 1900, as follows (Appellant's Narrative, page 186):

"In the South Branch the critical point probably, the critical stretch, is from Lake street to the turning basin at Ashland avenue. This will safely take, in my opinion, 8,000 cubic feet a second. From there on to the Drainage Canal, the river is much wider, and with the same depth would take an additional flow of water without any injury to navigation.

The current would not exceed 1¼ miles an hour through that stretch anywhere."

Mr. Isham Randolph, who laid out the project for the enlargement of the channels of the Chicago River and its branches for the diversion of 10,000 cubic seconds feet

through them to the Sanitary & Ship Canal, stated that with the river so improved, under the July 11, 1900, permits, the current would be less than a mile and a quarter per hour (*infra*, p. 43). There was some controversy as to this in the hearings before Secretary of War Stimson, so much mentioned. The Secretary in his statement made January 8, 1913 (Appellant's Narrative, p. 28), did not find that a current in the Chicago River exceeding a mile and a quarter per hour, would be created by the 10,000 cubic seconds feet diversion through it, or that such diversion would be in any way obstructive or injurious to navigation thereon.

Appellee's Point IV-A.

(Its Brief, p. 192.)

We have heretofore pointed out that,

United States v. *Rio Grande Dam & Irrigation Company*, 174 U. S. 698,

does not support appellee's contention that the July 11, 1900, permits would not authorize any effect upon the navigable capacity of other waters than the Chicago River. In that case the Secretary of War had not granted a permit for the diversion of the waters of the Rio Grande River. The Court held that, had there been such a permit, the Irrigation Company's works would have been treated as lawful structures.

We have heretofore pointed out that the channels of the Chicago River and its branches were enlarged under the July 11, 1900, permits (*infra*, pp. 42 to 45) so that the diversion of 10,000 seconds feet could be withdrawn through them; that under the Illinois statute the amount of water required as the population of appellant increased, should be diverted from Lake Michigan just as surely as if there were no gates at Lockport by which the diversion could be controlled. This follows, because the Act of May 29, 1889, is mandatory as to

the amount of the diversion, and the trustees of appellant could be forced under that Act to comply with it. (*Infra*, p. 54.)

Counsel refer to the September 11, 1907, and July 30, 1910, permits for the construction of the North Shore Channel and the Calumet Sag Channel, respectively, as granting a privilege to appellant, with a condition that the diversion should not exceed 250,000 cubic feet per minute. The September 11, 1907, permit on this subject, contains the following provision as a condition to the diversion of water through the North Shore Channel at Wilmette and the Lake Shore (Appellant's Narrative, p. 82):

> "2. That the total diversion of water from Lake Michigan through the Chicago River into the Illinois River, shall be no greater than already authorized by past War Department permits."

The July 11, 1900, permits were at that time valid and subsisting. Appellant had been for a number of years previously and was then actually performing the work of deepening and widening the channels of the Chicago River and its branches, as authorized by those permits. Such deepening and widening would permit the withdrawal of the amount of water required by appellant's organic act according to the population of appellant. Necessarily, appellant assumed that the condition of the September 11, 1907, permit for the diversion from Lake Michigan at Wilmette, Illinois, through the North Shore Channel, referred to those permits and not to the December 5, 1901, order, the latter one being made purely because of the then restricted channels of the Chicago River and its branches. At that time no objection had ever been made to the proposed withdrawal of water through the Chicago River as required by appellant's works. It could not be assumed by appellant that the War Department or the Attorney General would seek to enforce the order of December 5, 1901, which had become a mere paper limitation because of the removal of the reason for its issuance.

Counsel also refer to the condition of the permit of June 30, 1910, as follows (Appellant's Narrative, p. 83):

> "(d) That the amount of water withdrawn from Lake Michigan through the Chicago and Calumet rivers together, shall not exceed the total amount of 250,000 cubic feet per minute (4,167 cubic feet per second) already authorized to be withdrawn through the Chicago River alone."

Appellant had then completed its North Shore Channel. The suit of March 23, 1908, had been instituted by the Attorney General (Calumet River suit), questioning *only* the diversion through the Calumet River and Calumet Sag Channel proposed by this adjunct to the Main Sanitary & Ship Canal and the diversion through the Chicago River. The work of deepening and widening the channels of the Chicago River and its branches, had not then been completed. Under the permits of July 11, 1900, appellant had been diverting (admittedly), for a number of years, water in excess of the limitation of 4,167 seconds feet as it was required by its organic act. It was necessarily assumed that it was the desire of the Secretary of War to maintain this paper limitation *only* until the deepening and widening of the channels of the Chicago River and its branches had been *entirely* completed under the July 11, 1900, permits, and that, of course, such limitation would be removed when the work was done. Furthermore, condition (f) of said June 30, 1910, permit (Appellant's Narrative, p. 84) expressly provided that it should not be used in litigation

> "to determine the right of the said Sanitary District to divert from Lake Michigan for sanitary purposes an amount of water in excess of that now being diverted, without having first obtained a permit from the Secretary of War."

We have not used this permit and are not basing any right upon it. The only purpose of referring to it, was to show that any facts and controversies with reference to the diver-

sion through the Calumet River and the Calumet Sag Channel, are not material in this litigation. We are willing to assume that it was the intention of this permit that the privilege granted should be conditioned upon appellant's being limited to a diversion from Lake Michigan from all sources equal to that which it was under the facts, circumstances and the law, entitled to withdraw through the channels of the Chicago River and its branches to the Sanitary & Ship Canal; and that it should not make any claim for a diversion by way of the Calumet River and the Calumet Sag Channel in addition to that which it is entitled to take through the Chicago River. We do not believe that our attitude on these important matters can be characterized as

> "the untenable position taken by appellant throughout its brief." (Appellee's brief, p. 194.)

Appellee's Point IV-B.

(Its Brief, p. 195.)

The very language of the case cited by appellee

(*United States* v. *Rio Grande Dam & Irrigation Company*, 174 U. S. 690.)

shows that this court would not uphold an injunction unless the works of the irrigation company would

> "*substantially diminish the navigability,*"

of the Rio Grande River. We are amused at the attempt of appellee's counsel to make the word "substantially" mean "appreciably." Webster's New International Dictionary, defines the adjective *substantial*—

> "1. Consisting of, pertaining to, of the nature of, or being, substance; material; as, *substantial* life.
>
> 2. Not seeming or imaginary; not illusive; real; true.
>
> 6. Considerable in amount, value, or the like; large, as, a *substantial* gain.
>
> 8. That is of moment; important; essential; material."

The same dictionary defines the adjective *appreciable*—

> "Capable of being appreciated or estimated; large or material enough to be estimated; perceptible; as, an *appreciable* quantity."

We have distinguished elsewhere in this brief

Economy Light & Power v. *U. S.*, 256 U. S. 113, (*infra* 49),

U. S. v. *Chandler-Dunbar Co.*, 229 U. S. 53, (*infra* 29), and the

Wheeling Bridge case, 13 Howard 553, (*infra* 54).

We apprehend that the conflicting interests of health, on one side, and commerce, on the other, as here, is just as important to be considered as the "conflicting interests of commerce over the bridge and under the bridge" (Appellee's Brief, p. 198).

In

Henning v. *Georgia*, 163 U. S. 299, 317,

this court gave such consideration to the conflicting interests of the state's public morals with interstate commerce, that it upheld a state statute against operating trains intrastate as well as interstate on Sunday. See also the many other cases cited by us, Point 4 (b). (Appellant's Brief, p. 165, *et seq.*)

Union Bridge Co. v. *United States*, 204 U. S. 364.

The cases of

New York v. *State of New Jersey*, 256 U. S. 296,

and

Kansas v. *Colorado*, 206 U. S. 46

were cited by us in support of the position which we believe to be correct—that appellee here must establish its right to an injunction more clearly than would be required of one of the states of the Union in a suit against another.

Appelee's Point IV–C.

(Its Brief, p. 201.)

In the

Wheeling Bridge case, 13 Howard 553,

cited by appellee, the question of finding whether the bridge there considered was an obstruction to navigation was determined by ascertaining the height of the smoke-stacks or other projections of boats navigating the Ohio River which would come in contact with the span of the bridge. The number of feet that the smoke-stack extended above the water level could be ascertained by measurement with an ordinary tape. The distance from the surface elevation of the water in the Ohio River under the Wheeling bridge to the span of the bridge could likewise be determined by the use of a tape. Then it was a mere question of taking the two measurements and comparing them to see whether a boat could pass under the bridge. Here, as we have pointed out in our original statement of the case (our Original brief, p. 63), there was a complicated process used by appellee's experts to reach conclusions as to a supposed lowering effect and damage to commerce upon the Great Lakes.

APPELLEE'S POINT V.

(Its Brief, p. 202.)

We are pleased to note that appellee does not "laugh off" our argument that appellant's diversion is authorized under the Act of Congress of March 2, 1827, by the remark that it is "childish" or "puerile." The *amici curiae* brief in support of appellee's position characterizes our argument as to the effect of this Act of Congress as follows (*Amici Curiae* Indiana, *et al.*, Brief, p. 30):

> "Appellant, by a most interesting, *if not convincing*, argument, attempts to connect its right to the abstraction of water from Lake Michigan with the provisions of the Act of March 2, 1827."
>
> (Italics ours.)

Counsel call a mere guess the statement of Mr. Wisner (Rec. Vol. VI, p. 3433), as to the minimum run-off of the Chicago River drainage area being less than the amount of water drawn from the West fork of the South branch of the Chicago River through the old Illinois-Michigan Canal, after the pumps were installed at its Northern terminus, in the year 1883, thus causing the reversal of the flow of said river and the taking of water directly from Lake Michigan. It appeared that Mr. Wisner had for twenty-five years prior to the time he testified been connected with the appellant in the Engineering Department. During a large portion of the time he was its Chief Engineer and was thoroughly familiar with the various things necessary to know in order to reach the conclusion stated (Rec. Vol. VI., p. 3433). We apprehend that the taking of water from the Chicago River through the Illinois-Michigan Canal to the Desplaines and Illinois Rivers is not logically different from the direct taking from Lake Michigan, because the natural flow of the Chicago River was into Lake Michigan. The taking of the water before it reached the lake

—which water would naturally go there—is, we believe, the same as taking it from the lake itself.

The findings of Secretary of War Stimson of January 8, 1913, are fully discussed in our original brief (p. 205).

Appellee's Point V-A.

(Its Brief, p. 203.)

The Act of Illinois (January 9, 1836), under which the old Illinois-Michigan Canal was built, specifically provided that the canal should be at least 45 feet wide, and there should be reserved 90 feet on each side for the purpose of enlargement (Appellant's Statement, Original Brief, p. 18). Appellee makes the statement (its brief p. 209)—

> "It is not claimed that appellant's canal is within this 90-foot zone. It could not be, for the new canal is 160 to 200 feet wide."

The fallacy of appellee's statement is shown by merely adding the 90 feet on each side—which makes a total of 180 feet—to the original width of the canal, 45 feet, which gives an area of 225 feet for the enlarged canal. *This is substantially the width of the present Sanitary and Ship Canal in the earth section and is greater than the width of the Sanitary and Ship Canal in the rock section.*

The Act of Congress of March 30, 1822, expressly provided that ninety feet should be reserved on each side of the canal to be built. (Appellant's Brief, p. 16.)

Appellee states (its brief, p. 210):

> "The Act of Congress authorized a canal, not two canals or a dozen."

It was incumbent upon the state to build a canal suitable for navigation in consideration of the grant of land. The state did not exhaust its power or discharge its obligation by building a canal which in 1848 suited the then requirements of navi-

gation. To say that it could not and was not required to thereafter—when commerce demanded a larger canal—either enlarge the old canal or abandon it and build another in its place, is not in keeping with the purpose sought to be accomplished by the legislation in question. The requirement by the January 9, 1836, Act of Illinois that 90 feet on each side of the canal should be reserved for enlargement, and the same requirement of the March 30, 1822 Act of which the March 2, 1827, Act was a mere reenactment, beyond question shows congressional as well as state intent that the canal to be then built should be enlarged as the public interest might require.

Counsel refer to Section 3 of an Act of the General Assembly of the State of Illinois of July 1, 1919, (Appellee's Brief, p. 210). It is obvious that the *only* purpose of this legislation was to preserve this canal for use as a "terminal and harbor" in connection with the Sanitary and Ship Canal. It was not designed to maintain it for the purpose of providing means whereby boats could pass from the West fork of the South branch of the Chicago River to Joliet. Another construction is not in keeping with the physical conditions as they existed at the time the 1919 Act of the General Assembly of Illinois was passed, for then there existed the Sanitary and Ship Canal connecting the West fork of the South branch of the Chicago River with the Illinois and Michigan Canal at Joliet, which was much deeper and wider than the old canal and was designed by the state for the increasing demands of commerce on this water route.

There is no question but that the General Assembly of Illinois, under the Act of May 29, 1889, granted full authority to appellant to build the Sanitary and Ship Canal as a link in the waterway to the Gulf of Mexico. As we have pointed out in our original brief (p. 31)), Section 17 of the said Act expressly gave authority to enter upon, use, widen and deepen any waterway, canal or lake belonging to the state. The joint

resolution of May 28, 1889, adopted by the General Assembly, (Our Original Brief, p. 21) expressly stated the waterway policy and the purpose to build through Illinois a deep waterway, using the Chicago diversion.

Appellee states that there was no express authority to discharge sewage under the Act of March 2, 1827, into the canal or other waterways. (Appellee's Brief, p. 212.) This was very thoroughly considered in

Missouri v. *Illinois*, 200 U. S. 496.

The waterway was constructed. Necessarily, the people of Chicago could use it for the discharge of sewage and wastes, the same as all the other waterways of the United States have been used. Congress had not occupied the field. It was just as lawful to use the waterway in this way as were any other acts of the states under their sovereign powers.

Concerning the amount of water diverted or to be diverted by appellant, appellee puts the following query (Appellee's Brief, p. 213.)

> "Does that mean that eventually appellant will be forced to take 25,000 c. f. s. under the Act of 1827?"

Such consideration is wholly aside from any facts presented here. Appellant is acting under the Illinois Act of May 29, 1889. This Act authorized it to lay out and construct a canal across the Continental Divide not less than 10,000 cubic seconds feet in capacity, for the purpose of reversing at all times the Chicago River and diverting from the water supply the drainage and sewage. Under this act, it laid out a canal in the rock section of capacity of 14,000 seconds feet, and has built its diversion works now for a diversion of 12,000 seconds feet. It is probable that it is limited by the condition of the June 30, 1910, permit for the reversal of the Calumet River and Sag Channel to 10,000 seconds feet, or the amount it is under the facts and the law entitled to divert through the channels of the Chicago River and its branches to the Sanitary and Ship Canal.

Appellant has planned so that it will not be necessary to protect the water supply to divert the full maximum run-off of the Calumet Drainage Area approximately 15,000 seconds feet, by so arranging its Calumet Sag Channel and the intercepting sewer system, that the sewage and wastes may be carried to a point on the Sag Channel so that they will not ever be carried back into Lake Michigan. This is accomplished by placing the necessary controlling works at the Northern terminus of the Sag Channel. The Calumet Drainage Area population is comparatively sparse, and the problem there is entirely different from the one which exists to provide an outlet for the drainage and sewage emptying into the channels of the Chicago River and its branches. Why this question should be raised, is beyond our comprehension. There is no suggestion made in the pleadings or in the brief that the State of Illinois abused its discretion in authorizing the Sanitary and Ship Canal to be constructed with its attendant diversion, as provided by the Act of May 29, 1889. In fact, we apprehend under the authorities cited in our original brief (p. 162), that any such contention would receive no consideration by this court.

Counsel (Appellee's Brief, p. 213), in referring to statement (our Original Brief, p. 122) that it was necessary to have 10,000 cubic seconds feet diversion from Lake Michigan for navigation purposes, as well as for the protection of the water supply, characterize our statement to be

"without foundation in the record or in fact."

The fallacy of appellee's said statement is demonstrated by the report of the International Waterways Commission on the Chicago Drainage Canal, January 4, 1907, (Appellant's Narrative, p. 511), as follows:

"15. Although the primary object of the Chicago Drainage Canal was the discharge of Chicago sewage, *its function as a channel for navigation was kept in view from the beginning.* All of the bridges over it are draw

bridges with ample openings. A provision of this kind, as well as the care exercised to make the sewage inoffensive by liberal dilution, was necessary to conciliate the interests in the valley of the DesPlaines and Illinois River, which would otherwise be adversely affected. *It can hardly be doubted that the canal will eventually form a part of an improved waterway between the Great Lakes and the Mississippi River*, though its full depth will probably not be required for that purpose. Congress has not adopted any scheme for this improvement, but by its direction a survey was made, and plans with estimates for a waterway 14 feet deep were submitted, by a board of engineers in a report dated August 26, 1905. The board found that for a distance of about 100 miles from Chicago the improvement must be with locks and dams, and as the quantity of water required would be merely that needed for the service of locks and other incidentals, the extent of the improvement of depth which could be obtained in that part of the route was without limit so far as it depended upon the amount of water available. *For the remaining distance, about 223 miles, the improvement would be an enlargement of the open channel and the degree to which it was practicable was entirely dependent upon the quantity of water flowing. The board assumed that the Chicago Drainage Canal would eventually be permitted to take 10,000 cubic feet per second from Lake Michigan, and it expressed the opinion that with that volume added to the natural low-water discharge of the Illinois River a depth of 14 feet in the open channel could be maintained;* also that if a much greater depth was to be secured a much larger volume of water *must be taken* from Lake Michigan."

Further, Mr. Lyman E. Cooley, a witness for defendant, whose evidence is undisputed in the record, on the same subject, makes the following statement (Appellant's Narrative, p. 298):

"Perhaps I may add in that connection that in the later consideration of the matter by the State after 1907, it is based on a flow of 14,000 second feet; and that the Deep Water Project is not practicable without the aid of the large water supply from Lake Michigan, which has been authorized by the State law.

Outside of that, we would be limited to eight or nine feet as the best that could be done.

These depths of fourteen feet were predicated by the original act and collateral legislation in 1889, and in all subsequent legislation, were based on a flow of 10,000 feet and the report of 1907 used that depth of fourteen feet as a preliminary depth, but states that with the aid of the 14,000 feet, it will be possible to continue twenty-four feet to the City of Peoria and twenty feet more or less from thence to the mouth of the river.

And I assume from the fact that the constitutional amendment was based on that report, that is the project. It is the one that has been advocated by the Lakes to the Gulf Deep Waterways Association, and the one that was presented to Congress in the hearings of 1910, before the House Committee and before the Senate Committee, and Congress made conditional appropriation of a million dollars for the beginning of work, whenever an understanding should be reached with the State of Illinois regarding a plan of co-operation."

Recently, Col. William V. Judson, for a number of years United States engineer at Chicago, who studied late waterway projects of the State of Illinois, in a report concerning the use of the diversion of water from Lake Michigan by appellant for waterway purposes, March 23, 1921, (H. R. Document No. 2, 67th Congress, 1st Session), said:

"For a 9-foot channel with an increment of 4167 second feet, the cost, either with dams retained or removed, appears almost prohibitive, and the probability that Congress will limit the increment to 4167 second feet is, in my opinion, so remote that this hypothesis may be left out of consideration. * * * In my opinion, to most reasonably conform to the probable conditions of the future, an 8-foot project should now be adopted, based on a 7500 second feet withdrawal for purposes of estimate, and with all dams removed. *Then should Congress place the limit of the amount of water to be withdrawn from Lake Michigan at* 10,000 *second feet, which I deem probable, and under proper conditions, advisable,* that increment would of itself increase the depth to 9 feet."

Counsel refer to the case

In re Boyer, 109 U. S. 629,

which case merely holds that admiralty has jurisdiction concerning the collision of two boats navigating the Illinois and

Michigan Canal. The crossing of this canal by the Calumet Sag Channel, was authorized by the Secretary of War permit of June 30, 1910. (Appellant's Narrative, p. 82.)

In building appellant's Sanitary and Ship Canal, appellant did not excavate in the Illinois and Michigan Canal. It built a large canal to replace the old canal, providing for the new canal a connection with the Upper Basin of the Illinois and Michigan Canal in the DesPlaines River. The new canal became a navigable water of Illinois and of the United States, all of which was agreeable to Federal and State policies. *Mortell* v. *Clark*, 272 Ill. 210, (Appellant's Brief, 119).

Here (Appellee's Brief, p. 215) appellee merely rehashes arguments made elsewhere and fully answered by us. (*Infra*, p. 29.)

Appellee's counsel refer to the statement in the report of appellant's president as to any limitation of the amount of diversion. Appellant's president, however, in that report (Appellee's Brief, p. 217) said:

> "I believe that we should have the volume requested for our needs as they appear and are justified."

We ask, can any one question the good faith and fairness of such a statement? This statement was made by an official representing the public, who had no purely private concern in the matter. The reference, counsel make to this statement, only shows the extremities to which they are driven for any argument.

We have heretofore mentioned appellant's witness Wisner's conclusions as to the minimum run-off of the Chicago River Drainage Area (Infra, p. 69). That river's drainage area run-off was stated by Mr. Wisner, and it is not disputed in this record. (Appellant's Narrative, p. 189.)

> "The drainage area of the Chicago River basin is about 307 square miles. The run-off of the Chicago River basin in a dry season is practically the city water supply, and some little ground water, but at times of maximum floods it will reach as high as 10,000 cubic feet per second."

Mr. Cooley also testified that the maximum run-off of the Chicago River Drainage Area was 10,000 cubic seconds feet (Appellant's Narrative, pp. 278, 279). In fact the determination of this maximum run off was one of the first steps taken by the Drainage & Water Supply Commission in planning this work. It is hardly fair to characterize the statements as guesses. They were the findings of witnesses competent to make them. There was no evidence offered by appellee in opposition. If there had been, appellant could have cumulated its evidence in this respect.

Appellee's suggestion that the State of Illinois has not delegated its authority under the Congressional Act of March 2, 1827, to appellant, is too frivolous to require answer.

Appellee's Point V-B.

Its Brief (p. 219)

The Act of June 29, 1906, entitled

> "An Act for the control and regulation of the waters of the Niagara River, for the preservation of Niagara Falls, and for other purposes,"

at this point in its brief, is specially discussed by appellee, and some remarkable claims are made. Counsel attempt to construe the Act to prohibit diversions from any of the Great Lakes in the United States for any purpose, domestic, sanitary or navigation, except by the consent of the Secretary of War. Realizing the insufficiency of Section 10 of the 1899 Act, to support their contentions, counsel seek *by construction* of the Niagara Falls Act to make it apply to the Chicago diversion. The mere fact that to support their position a construction of the Act is necessary under the authorities cited by us in our original brief (Point IV (b), pp. 165-173), furnishes the answer, as by counsel's own admission Congress has not by those plain and unmistakable expressions required, exercised its power over these diversions.

The Act only applies, as it is stated expressly in the first section, to

> "the diversion of water from Niagara River or its tributaries in the State of New York."

The committee report quoted by counsel (their Brief, p. 221) upon this very Act, expressly recited the conditions under which diversions had and did then exist for water power purposes from the Niagara River at Niagara Falls in the State of New York; that the diversions at that time were authorized only by acts of the State of New York. The Federal Government had not prior to that time assumed any jurisdiction; and the committee believed that the Federal Government should *then* exercise its authority. As the committee report states:

> "It is thought best by the Committee that the Federal authority should *now* be exercised * * *"

In another place in the report, it is stated:

> "It is, however, very desirable, if not essential, that legislation be *now* enacted to prevent the further depletion or diversion of the waters of the river, and to furnish a basis for diplomatic action".

This is a clear and definite statement that as to *diversions* even from boundary waters for *any purpose*, Congress had not seen fit to exercise its power; that the diversions up to that time had been treated as lawful, having *only* the authority of the State of New York. So, when Congress sought to exercise its powers over the subject of diversions, it confined itself to the diversions from the Niagara River, and specifically authorized the Secretary of War to grant certain permits. Section 2 prescribes the conditions under which the Secretary of War may grant permits for power diversions. His course of action in exercising this power, delegated to him, is definitely prescribed. Up to that time no authority had been granted to the Secretary of War to fix diversions or to interfere in any manner with the State's action as to diversions; other-

wise there would have been no occasion for the passage of the Niagara Falls Act. And when Congress assumed jurisdiction over diversions, it confined its regulation to the Niagara River or its tributaries, *in the State of New York*. All other diversions were excluded, not only impliedly, *but expressly*, and, impliedly and expressly, by said Act, they were left in the same condition they were before the Niagara Falls Act was passed, namely, the authority of the State, in which the diversion was authorized, was left supreme and unhindered by Congressional Act or Federal regulation.

The proviso of Section 1 relates to the first part of the Section, namely,

> "that the diversion of water from Niagara River or its tributaries in the State of New York, is hereby prohibited, except with the consent of the Secretary of War, as hereinafter authorized in Section 2 of this Act".

The proviso applies to the whole of the first clause of Section 1, and when the words are used in the proviso,—

> "That this prohibition shall not be interpreted as forbidding the diversion of the water of the Great Lakes or of Niagara River for sanitary or domestic purposes, or for navigation,"—

Congress did expressly say that the Niagara Falls Act should not only not apply to the Great Lakes, but not even to the Niagara River, as to diversions for sanitary, domestic or navigation purposes. When the words were used following the ones last quoted of the proviso,—

> "the amount of which may be fixed from time to time by the Congress of the United States or by the Secretary of War of the United States, under its direction",—

it merely expressed the condition which existed anyway, that Congress might in the future specially exercise jurisdiction to regulate diversions for those particular purposes. It had not theretofore done so. We cited and discussed this Niagara Falls Act (our Original Brief, Point IV (C), p. 179) to show that Congress at the time it was passed, expressed itself to

the effect that it did not consider it had prior to that time assumed to regulate diversions or to authorize the Secretary of War to regulate them for domestic or sanitary purposes. We also in our original brief (p. 53, 180) referred to the debate in the Senate when that body was considering the conferees' report on the Niagara Falls Act, and to the very pertinent and illuminating statement of the late Senator Lodge—

> **"The first section of the bill protects the right of Chicago."**

Counsel refer to the case of

Cummings v. *Chicago,* 188 U. S. 410,

and assume to quote from the opinion in that case (Appellee's Brief, p. 223), which does not support their contention as to a negative pregnant. The quotation is not from the opinion of this Court in

Cummings v. *Chicago, supra,*

but is from the opinion in

Lake Shore, Michigan Southern Railroad Company v. *Ohio,* 165 U. S. 365, 368,

wherein it was claimed that Section 7 of the 1890 Act delegated to the Secretary of War exclusive authority as to the authorization for the construction of bridges over streams wholly within the state. The particular clause of Section 7 of the 1890 Act under consideration in that case, is the one in the proviso after the word "provided", in the last part of said section, as follows:

> "Provided, That this section shall not apply to any bridge, bridge-draw, bridge piers, and abutments the construction of which has been heretofore duly authorized by law, or be so construed as to authorize the construction of any bridge, draw-bridge, bridge piers, and abutments, or other works, under an act of the legislature of any state, over or in any stream, port, roadstead, haven, or harbor, or other navigable water *not wholly within the limit of such state*".

The Court merely held in *Lake Shore, Michigan Southern Railroad Company Case, supra,* that the words

"not wholly within the limit of the state",

showed that as to waters *wholly* within the limits of the State, the State's authority was not curbed; that, still, as to bridges over such waters, the State could authorize their construction.

Referring to the proviso of Section 1 of the Niagara Falls Act, it must follow that as to waters diverted for sanitary, domestic or navigation purposes from the Great Lakes or from the Niagara River, the States' authority still existed under their reserved powers.

The only limitation was that Congress might thereafter assume jurisdiction over diversions for such purposes, or direct the Secretary of War to take action regarding them.

Counsel again refer to

United States v. *Rio Grande Dam & Irrigation Company,* 174 U. S. 690,

and suggest that we reread that case. We find no reference in that case to diversions for either sanitary, domestic or navigation purposes. Furthermore, the use of the water of the Rio Grande River was not provided for under any reserved power of a state, but only under legislation of a territory — New Mexico. **Furthermore, the Denver and Rio Grande Dam & Irrigation Works had not been either under construction or in operation for upwards of a third of a century under such circumstances that Congress was not only directly advised, but because of the magnitude, must be presumed to have known of their existence, whereby it should be concluded that their construction and operation were treated by Congress as lawful and proper, at least until it should interpose itself to specifically and specially regulate it.**

Appellee's Point V–C.

(Its Brief, p. 226)

Counsel quibbles (its brief, p. 226) over our statement that that International Waterways Commission, by its January 4, 1907, report regarding the Drainage Canal, recommended that the Chicago diversion should be allowed to the extent of at least 10,000 cubic seconds feet of water; whereas appellee's counsel say the report recommended that the diversion should not exceed 10,000 cubic seconds feet, or that the Government should prohibit the diversion of more than that amount. We fail to see any real distinction in view of the fact that the amount of diversion in controversy here is 10,000 cubic seconds feet.

It was perfectly reasonable that the International Waterways Commission, upon whose recommendations the terms of the Treaty of 1909 were fixed, should treat the diversion of 10,000 cubic seconds feet as an existing diversion. The capacity of the canal was at least 10,000 cubic seconds feet. The works of appellant, including the deepening and widening of the channels of the Chicago River and its branches for 10,000 cubic seconds feet diversion, had been substantially completed. It remained only for the population to increase, as it has done, so that the legal ratio of dilution would require shortly the full 10,000 cubic seconds feet. As we pointed out in our original brief (p. 190), the International Waterways Commission, in its January 4, 1907, report, in speaking of the Chicago Drainage Canal diversion, said:

> "Nor does it wish to re-open the case of the Chicago Drainage Canal as designed and built. *It accepts that as a fixed fact, with its attendant diversion of* 10,000 *cubic feet per second through the* Chicago River". (Appellant's Narrative, p. 522.)

NOTE: The quotation in our original brief is incorrect, in that the words "in the bill" should be as above quoted—"and built".

The above report was on the subject of the Chicago Drainage Canal. Reference to earlier reports of the International Waterways Commission upon the subject of the diversion of the waters of the Niagara River, at Niagara Falls, for power purposes between the United States and Canada indicates that the United States was charged with the full 10,000 cubic seconds feet diversion at Chicago in determining the amount that should be allowed to Canada and to the United States. The Canadian section of the International Waterways Commission, April 25, 1906, made a report on this subject, a portion of which is as follows: (Appellant's Narrative, p. 103)

"If our proposal is carried out the diversion will be about as follows:

Diversion on the American Side Per Second Cubic Feet	
Niagara Falls	18,500
Chicago Drainage Canal	10,000
Total	28,500
Diversion on the Canadian Side	
Niagara Falls and on the Niagara Peninsula	36,000"

* * *

"The diversion by the Chicago drainage canal should be limited to the use of not more than 10,000 cubic feet per second. * * * This would give an apparent advantage to Canadian interests, but as the diversion is not of serious injury to the Falls and does not materially affect the interests of navigation, it is more than counter-balanced by the complete diversion of 10,000 cubic feet by way of the Chicago drainage canal to the Mississippi River."

On May 3, 1906, the International Waterways Commission made a report signed by both the Canadian and American members, in part as follows: (Appellant's Narrative, p. 104):

"The Commission has made a thorough investigation of conditions existing at Niagara Falls and the two sections have presented reports to their respective govern-

ments setting forth these conditions, to which attention is invited. The following views and recommendations are based upon a careful study of the facts and conditions set forth in these reports * * *"

* * *

"3. The Commission, therefore, recommends that such diversions, inclusive of water required for domestic use or the service of locks in navigation canals, be limited on the Canadian side to 36,000 cubic feet per second, and on the United States side to 18,500 cubic feet per second (and in addition thereto, a diversion for sanitary purposes, not to exceed 10,000 cubic feet per second, be authorized for the Chicago drainage canal), and that a treaty or legislation be had limiting these diversions to the quantities mentioned."

The report of January 4, 1907, of the International Waterways Commission, on the Chicago Drainage Canal, only related to whether the two countries should agree to a diversion in excess of 10,000 cubic seconds feet of water, which amount the previous report of the Commission, as above stated, had recommended and had treated as an existing diversion, as appears by the following statement of said report: (Appellant's Narrative, p. 514):

"20. It was not generally known until after publication in March last of the report of the American section of this commission upon Niagara Falls that an amount greater than 10,000 cubic feet per second would be asked for. In that report, subsequently concurred in by the Canadian section, it was recommended that the diversion of 10,000 cubic feet be allowed. The preservation of Niagara Falls alone was considered, and that in the light of the tacit agreement above described. It was supposed at the time that this was all that Chicago needed, but the recommendation gave offense to the officials of the sanitary district, and the further demand then came out in the form of appeals to the committees of Congress and to the Secretary of State. It is necessary now to take up the question anew, and, after considering it in all its bearings, to reach some conclusion as to whether there should be a limit to the amount of water to be diverted at Chicago, and, if so, as to what that limit is."

Again the Commission stated, in its report (Appellant's Narrative, p. 522), as follows:

> "The extension of the system (diversion) to the Calumet River, alone, is in question".

Further, the said report stated (Appellant's Narative, p. 528):

> "The preservation of the levels of the Great Lakes is imperative. The interest of navigation in these waters is paramount, subject only to the right of use for domestic purposes in which term is included necessary sanitary purposes. In our report of November 15, 1906, upon the application of the Minnesota Canal & Power Co. to divert certain water in Minnesota, we recommended, among other things 'that any treaty which may be entered into should define the uses to which international waters may be put by either country without the necessity of adjustment in each instance, and would respectfully suggest that such uses should be declared to be (*a*) uses for necessary domestic and sanitary purposes; (*b*) service of locks for navigation purposes; (*c*) the right to navigate.' It is our opinion that so far as international action is concerned a treaty provision of that kind is all that is required in this case. We accordingly renew our recommendation of November 15, 1906, just quoted."

It is apparent from the foregoing quotations from the International Waterways Commission reports, which formed the basis of the treaty, that both of the high contracting parties agreed to the diversion of 10,000 cubic seconds feet of water from Lake Michigan at Chicago, and that it was treated as an existing diversion. **The right to divert that amount from Lake Michigan, was not, at the time the treaty was made, in dispute.** The only dispute was as to the right to withdraw an additional 4,000 cubic seconds feet through the Calumet River and the Calumet Sag Channel. Therefore, Article 2 of the Treaty, providing for suits to be instituted by citizens for damages, and the right of either one of the high contracting parties to object in case of injury to navigation, could

only apply, so far as the Chicago diversion was concerned, to any diversion in excess of the 10,000 cubic seconds feet. Article 2 expressly, as pointed out by us in our original brief, reserved the right to the United States and to the respective state governments, to deal as they should see fit with non-boundary waters like Lake Michigan (as to uses of water thus in dispute) subject only to the said limitations as to suit and objection for injury to navigation. 10,000 cubic seconds feet diversion was not in dispute.

Article 3 of the Treaty expressly provides that it should not interfere with the uses of boundary waters for domestic and sanitary purposes. Article 8, states the order of precedence, and makes the use for domestic and sanitary purposes paramount or first. Our object in referring to those clauses in our original brief, as is obvious, was to show that even as to boundary waters, diversions for domestic and sanitary purposes should not be disturbed; and also, to give further support to the express words of Article II, reserving full rights in the United States and respective state governments, as to diversions from non-boundary waters.

It will be observed in the quotations from the International Waterways Commission report of May 3, 1906 (infra, p. 84), and the report of January 4, 1907, (infra, p. 84), that they treated the Chicago diversion as being one for ordinary sanitary purposes. Counsel suggests that other cities about the Great Lakes might do the same thing, thus, as they say, entirely draining the lakes, and that Chicago is the only city which diverts water for this purpose and therefore it cannot be treated as a diversion for ordinary sanitary purposes. On the other hand, it is obvious that it is an ordinary diversion, because it was the only way Chicago could protect its water supply. The other cities about the Great Lakes are not so situated that they, or any of them, could take advantage of this best way of providing pure drinking water.

Mr. Lyman E. Cooley, in his testimony on the subject of the Chicago diversion, which evidence is undisputed in this record, stated (Appellant's Narrative, p. 311):

"Chicago is the only city situated about the Great Lakes in which sewage disposal can be made through the back lots, and in which even storm waters for long distances along the lake shore may be absolutely excluded from the lake itself, the source of water supply. The pass that we have to cut down to divert our waters to the southwestward is only 7 to 8 feet as measured by the rock floor at Lemont above the low water of 1847; and only 2 to 3 feet above the high water of 1838, so that a channel can be cut in that direction at a minimum cost.

On the other hand, the lowest divide to the east between the waters of the lakes and the Ohio River is the Wabash-Maumee Divide at Ft. Wayne, which is about 190 feet above Lake Erie. And on the north is the Fox-Wisconsin Divide at Portage, Wisconsin, between the Fox River that empties into Green Bay and the Wisconsin River which empties into the Mississippi River, and this divide is 210 feet above the lake. So it is not possible at any other point about the Great Lakes to make a solution at all similar to that which has been provided at Chicago.

It is one of the endowments of our site, and it is the reason we are here, and it is the reason that the city is here; and from my point of view we are entitled to avail ourselves of it like any other bounty of nature, and to utilize the lakes in that connection.

From a conservation standpoint we utilize the lakes in that connection for all the utilities that can be worked out of it. It is perhaps the highest conservation to which waters have ever been put in the world."

APPELLEE'S POINT VI.

(Its Brief, p. 236.)

Appellee, under Point VI discusses the effect of the various permits. We concede, only for the sake of argument, the proposition suggested in the first paragraph of appellee's brief under this point (Appellee's Brief, p. 236).

Appellee's Point VI-A.

(Its Brief, p. 236.)

We fail to see the purpose of the quotation from Major Marshall's report of June 24, 1896 (Appellee's Brief, p. 237). Major Marshall suggested there were certain questions to come up later—among them, whether the diversion would be allowed by the United States and Great Britain. The treaty of January 11, 1909, reserved to the State of Illinois the right to divert water from Lake Michigan for sanitary purposes. Congress has treated the diversion as lawful, in that it has not seen fit to regulate diversions for these purposes. The right to divert the amount claimed by appellant has been authorized not only by the permits of July 11, 1900, but by the one of May 8, 1899.

Appellee's Point VI-B.

(Its Brief, p. 238.)

We pointed out in our original brief that the recital (May 8, 1899 permit),—that the Chicago River had been improved at the time the permit was granted for a withdrawal through it of 300,000 cubic feet per minute—, did not limit the granting clause of the permit, which *granting clause* contained no words of limitation. We cited *Corrigan Transit Co. et al.* v. *Sanitary District of Chicago,* 137 Fed. 851, which held that

the recital and the preambles of the permit in no way modify the granting clause.

Counsel say (Appellee's Brief, p. 241) that the December 5, 1901, order was accepted by appellant "in lieu of previous permits" and referred to the condition of said order stating that the permit was "subject to such modification as the public interest may from time to time require." How this December 5, 1901, order could be in lieu of the May 8, 1899, permit, it is difficult to conceive. The order was made under Condition 2 of the 1899 permit, which related solely and only to modification in the event a current should prove unreasonably obstructive to navigation on the Chicago River. The Secretary of War could not enlarge that condition by using words in a conditional clause in the order, which order was made expressly, and could only spring from Condition 2 of the original permit.

Appellee's Point VI-C.

(Its Brief, p. 241.)

July 11, 1900, permits.—Here again counsel fail to take into consideration the long expressed purpose of appellant in enlarging the channels of the Chicago River and its branches. The ordinance of April 21, 1891, of appellant's Board of Trustees expressed its purpose concerning these river channels. The applications for the July 11, 1900 permits recited the plan of widening of the river channels to 200 feet and their corresponding deepening. Such excavations of the river channels were designed to, and the result would, enlarge the cross sections of the river channels for a flow of 10,000 cubic seconds feet through them limited to a current of less than a mile and a quarter an hour prescribed by the Secretary of War. It was part of the plan adopted by the Board of Trustees under the ordinance of April 21, 1891, to make these river channels the supply channels for the Sanitary and Ship Canal, with its capacity of 10,000 cubic seconds feet of water. This

plan was expressed by said ordinance (April 21, 1891—appellant's original brief, p. 34). The first application for permit to carry out this program was made June 16, 1896, in which it was stated (Appellant's original brief, p. 36):

> "The work of the Sanitary District has progressed so far that it is now necessary for us to enter upon that which must be done in the Chicago River to make available the artificial channel which we have under construction from Robey Street, Chicago, to Lockport in Will County, twenty-eight miles distant.
>
> Our connection with Lake Michigan must be through the Chicago River, with the West Fork and the South Branch of which we make a junction at Robey Street."

The excavation under these July 11, 1900, permits was in furtherance of the original plan. This work accomplished the purpose of appellant for its required diversion. General Bixby so found in his report of 1906 on the Chicago Drainage Canal (infra, p. 61). Secretary of War Stimson in his January 8, 1913, statement did not find that a current was or would be created in the Chicago River, obstructive to navigation, with a diversion of 10,000 cubic seconds feet through the enlarged channel of the Chicago River and its branches. The permits of July 11, 1900, were subject to the same conditions as the May 8, 1899, permit. After the work under the July 11, 1900 permits was done the Secretary of War has never found, or objected to the diversion of 10,000 cubic seconds feet through the channels of the Chicago River and its branches to the Sanitary and Ship Canal on the ground, that a current was, or would be, created injurious to navigation on said river.

Appellee's Point VI-D.

(Its Brief, p. 243.)

The effect of the September 11, 1907, permit as to the North Shore Channel, and the June 30, 1910, permit as to the Calumet Sag Channel, has been discussed by us elsewhere (infra, pp. 64. 65).

Appellee's Point VI–E.

(Its Brief, p. 243.)

Counsel cites *Southern Pacific* v. *Olympian Dredging Co.*, 260 U. S. 205, which has been discussed by us elsewhere (infra, p. 49).

APPELLEE'S POINT VII.

(Its Brief, p. 244.)

Counsel curiously quote a part of a sentence from our brief (p. 152), as indicating that we concede that Congress may occupy the field so far as diversions by states for sanitary and domestic purposes are concerned, to the exclusion of any exercise of power by the state. Our position is that that question is not now before this Court, as is indicated by the sentence immediately following the one partly quoted by appellee. The states' acts are lawful until Congress occupies the field, which it may do at any time. It cannot be deemed to have occupied the field unless it has clearly expressed such intention.

Appellee's Point VII-A.

(Its Brief, p. 247.)

Counsel cite *Henderson* v. *Mayor of New York*, 92 U. S. 183, but do not state the true facts of that case. In *Miln* v. *City of New York*, 11 Peters 103, this Court held valid Section 1 of the Statute of New York, providing that the Master, within twenty-four hours after arrival, should report to the Mayor the name, place of birth, last legal residence, age and occupation of every person brought as a passenger. In the *Passenger cases*, 7 Howard 283, the Court held a Statute of New York placing a tax of a certain amount upon each passenger coming into the port to be invalid as a direct tax or burden upon interstate commerce

In

Henderson v. *Mayor of New York, supra,*

the statute of New York in question required the Master to give a bond of a certain amount for each passenger, and upon failure to give bond, to pay a certain amount for each

passenger coming into port on his vessel. Failure to give bond or make payment incurred a penalty of $500 for each default, which was made a lien upon the vessel. The Court held that the real purpose of the statute was to collect the $1.50 per passenger and that it was, therefore, void, as a direct tax or burden upon interstate commerce. *Miln* v. *New York, supra,* was merely distinguished. It was not overruled.

Kansas City S. R. Co. v. *Kaw Valley Drainage,* 233 U. S. 75,

held invalid an order of the state court directing the absolute removal of a bridge over which interstate commerce was carried. These cases have no application to the propositions here.

Appellee's Point VII-B.

(Its Brief, p. 249.)

Counsel quote from *Morgan* v. *Louisiana Board of Health,* 118 U. S. 455. We paraphrase part of their quotation to suit the facts in this case as follows:

> "But it may be conceded that whenever Congress shall undertake to provide for the commercial cities of the United States a general system *prescribing the use and diversion of navigable waters of the United States for public health (of quarantine)*, or shall confide the execution of the details of such a system to a national board of health, or to local boards, as may be found expedient, all state laws on the subject would be abrogated, at least so far as the two are inconsistent."

NOTE: We replace the words in parentheses by the words in italics in paraphrasing the quotation to emphasize its application to this case.

Counsel neglected to add the very pertinent last sentence of the paragraph quoted, as follows:

> **"But until this is done, the laws of the State on the subject are valid."**

The second reason given by this Court, for its said holding, is stated as follows (p. 465):

> "But, aside from this, quarantine laws belong to that class of state legislation which, whether passed with in-

tent to regulate commerce or not, must be admitted to have that effect, and which are valid until displaced or contravened by some legislation of Congress.

The matter is one in which the rules that should govern it may in many respects be different in different localities, and for that reason be better understood and more wisely established by the local authorities. The practice which should control a quarantine station on the Mississippi River, a hundred miles from the sea, may be widely and wisely different from that which is best for the Harbor of New York. In this respect the case falls within the principle which governed the cases of *Wilson* v. *Blackbird Creek Marsh Co.*, 2 Pet. 245 * * *." (Many more like cases were cited)

So, here the question of the proper way to provide a pure water supply for Chicago and thereby protect the public health may be best handled by the local authorities. The use of the navigable waters of the United States for that purpose, in the way most suitable for the interests of the locality, should be determined by the local authorities. The proper solution of the problem in one locality may be entirely different and may require entirely different application of principles to the solution in another locality. We have in the United States cities located where the temperatures are extreme. In other parts, there is practically no change. In some localities the people are engaged entirely in industrial pursuits—such as manufacturing; in others, agriculture or the raising of fruits are the principal activities. The ideals and desires of the people of different localities are not alike. The people of some localities demand that greater care should be taken in the protection of health and in the removal of odors or things offensive to the eye. The people or their representatives in local self-government in each of these localities can best determine how their purely local affairs in the interest of public health shall be administered. It is the purpose of Congress to permit the activities of the local governments to continue as exercised by them under the police power for public welfare, but always with the reservation

that Congress may, when it finds the occasion necessary, intervene. Until it does, the local regulations are valid. An excellent example is the Congressional Act for the preservation of Niagara Falls of June 29, 1906, under which Congress stepped in to regulate diversions from the Niagara River. These diversions, based solely upon the laws of the State of New York, **even for power purposes from an international stream, injuring navigation not only on the Niagara River but on Lake Erie, outside of the State of New York, were considered lawful and valid.** And these diversions for power purposes from this international stream were created and continued during the pendency not only of the Act of September 19, 1890, but also that of March 3, 1899. Yet, no action was taken by the Attorney General or appellee to enjoin those diversions. These corporations diverting water to make electricity to sell for profit were treated as law-abiding citizens. On the other hand, appellant, a public municipal corporation, sustained by public taxation, is considered and called a culprit, acting beyond the pale of the law.

Appellant's justification, not only under the direct Act of Congress of March 2, 1827, but further under the permits of the Secretary of War, acting under Section 7 of the 1890 Act and Section 10 of the 1899 Act, and under the law of overruling necessity, Congress not having regulated the subject, is called baseless, and likened to the apology of a child.

The case of

Mobile County, etc. v. *Kimball*, 102 U. S. 691,

related to an improvement by the state of the River, Bay and Harbor of Mobile under an act of the legislature of Alabama, and the language of the case is applicable only to that situation.

We have heretofore pointed out the necessity of the diversion of 10,000 cubic seconds feet for navigation purposes as well as for the protection of Chicago's drinking water supply (infra, p. 72). Counsel assert that no one of our cases

cited under Point IV.-B is in point (Appellee's brief, p. 252). In support of this statement they say:

> "*New York* v. *Miln*, 11 Peters 102, was overruled in *Henderson* v. *Mayor of New York*, 92 U. S. 183; 23 Law Ed. 543."

New York v. *Miln, supra*, on the contrary, was reaffirmed in *Henderson* v. *Mayor of New York, supra*, and the latter case was distinguished from the *Miln case*, as we have pointed out (infra, p. 92) because the purpose of the section of the statute under consideration in *Henderson* v. *Mayor of New York* was a direct tax upon the passengers or the boat carrying the passengers of so much per passenger. It was held to be a direct tax or burden upon interstate commerce. The requirement of the statute under consideration in *New York* v. *Miln*—that the master should give the names and other information as to each passenger on his boat—was held to be a proper regulation under the police power of the state.

Our Point IV.-B (Appellant's original brief, p. 163) is that Congress did not intend that the Secretary of War could regulate the diversion of water from Lake Michigan and thus frustrate acts of the state pursuant to police power. In order that the act should be so construed, it was necessary that such Congressional intention should appear plainly and in unmistakable terms.

Under Point IV.-C of our original brief (p. 176), we showed that, as to this particular diversion, Congress, by other acts, had indicated that it was not its intention that the Chicago diversion for sanitary purposes should be limited.

We do not quarrel with the quotation from *Wilkerson* v. *Rahrer*, 140 U. S. 545, as appellant's diversion "does not belong to commerce." (Appellee's Brief, p. 253.)

In

Wisconsin v. *Duluth*, 96 U. S. 375,

the Court had under consideration acts of Congress specially relating to the Duluth Harbor and the canal across the Saint Louis River to Superior Bay in Wisconsin.

APPELLANT'S POINT VIII.

(Its Brief, p. 255.)

Appellee asserts various facts, some sixteen in number, to establish no acquiescence or estoppel on the part of appellee. We will take them up in order.

(1) Appellant's work was instituted prior to September 19, 1890. (Infra, p. 27.)

(2) Appellee's officers co-operated with appellant in building its canal and in providing for the diversion to the amount of water claimed by appellant it has a right to withdraw from Lake Michigan. (Appellant's Statement of the Case, its brief, pp. 18 to 29, 34 to 41, *Infra*, pp. 104 to 110.)

There was no suggestion that congressional action was required, but merely that Congress might exercise its power under the commerce clause of the Constitution to regulate the diversion. Until that was done, under the law, appellant's acts were lawful and legal. There was no pretense that executive officers might attempt or had the power to hinder or limit appellant in the operation of its diversion works as proposed.

(3) This point is answered under (2), *supra.*

(4) The engineer's report of August 16, 1895, referred to by appellee, related to the subject of lake levels. When the permits were later given, not only for the enlargement of the Chicago River to physically make possible the diversion, but also for the channels opening, under the permit of May 8, 1899, they did not contain any condition as to the effect of the diversion upon surface elevations of the lakes. If there was any injury to lake levels, it was waived.

(5) By the Treaty of 1909, Great Britain has consented to the 10,000 cubic seconds feet diversion. In any event, it can not object.

Congress has not acted to modify the diversion, which is one of the conditions of the permits. The action here is only by executive officers to limit the diversion.

(6) The permits only recited as a condition the paramount authority of Congress, not "of the Federal Government" acting through executive officers.

(7) The Act of 1899 was not retroactive. It was only prospective. Structures built, lawful under previous conditions, were not made illegal.

(8) Again, it was the paramount authority of Congress that was recognized under the application for the permit of May 8, 1899, and in the permit itself; not that of the Federal Government, stirred into action by executive officers.

(9) The May 8, 1899, permit was attempted to be modified by the Secretary of War, acting solely under Condition 2 of the permit relating to current in the Chicago River. Obviously, when appellant had created the cross sections of the Chicago River and its branches to remove any necessity for limitation of flow, as there was no current affecting navigation, the orders limiting the withdrawal ceased to have effect, or the Secretary had no power in the matter.

(10) The effect of the September 11, 1907, permit and the condition thereof, has been fully discussed by us elsewhere. (Infra, p. 64.)

(11) Appellee's counsel are quite free in their interpretation of the prayer of the bill of the Calumet River suit. They say (Appellee's brief, p. 259):

> "The prayer of the bill was for an injunction restraining appellant from reversing the flow of the river and from withdrawing from Lake Michigan any water except as authorized by the Department of War (the amount of water thus authorized being then 4,167 cubic seconds feet)."

The bill in that case relates only to the withdrawal through the Calumet River and Calumet Sag Channel. The prayer

likewise covers that and nothing else. Note the following express words of the prayer which eliminated the Chicago River (Rec., Vol. VIII, p. 6):

> "and from doing or attempting anything in any way to reverse the flow of the said Calumet Rivers, and from doing or attempting anything in any way to divert or abstract any waters from Lake Michigan in any channel *other than the Chicago River as already authorized by said Secretary of War,* unless *prior to beginning any of said work* or doing or attempting to do any of such things, *the Chief of Engineers of the United States shall have recommended, and the Secretary of War of the United States shall have authorized, the doing of such work.* * * *"

At the time this bill was filed, March 23, 1908, the permits of July 11, 1900, were in existence, valid, had never been revoked. The work recommended by the Chief of Engineers and authorized by the Secretary of War had been commenced, was then proceeding, and appellant was expending vast sums in performing it. The prayer of the bill itself expressly eliminated from any question the diversion through the Chicago River and its channels resultant from *work recommended by the Chief of Engineers and authorized by the Secretary of War.* And this bill was filed by the Attorney General under the same authority, Section 12 of the 1899 Act, that the bill in the main channel suit instituted October 6, 1913, is sought to be sustained. A plainer recognition of appellant's right to divert the 10,000 cubic seconds feet through the channels of the Chicago River and its branches to the Sanitary and Ship Canal, and of our position in respect to it, it would be difficult for appellant itself to make to order.

(12) Appellee has set forth here the average yearly flow of water through the Sanitary and Ship Canal, beginning in the year 1900, and ending with the year 1913. Some point is attempted to be made of a passing remark in the report of the International Waterways Commission of January 8, 1910, to the effect that it had asked for the records of withdrawal,

and had been refused by appellant. We know of no issue raised in this record that appellant had refused to give information to appellee as to the amount of its withdrawal. Such refusal to this one commission might have been made by some clerk or officer of the appellant and without the sanction of its board of trustees or its president. There is no place in the record where there is an assertion made by appellee that it did not know of the amount of the average yearly diversion during all this period. Immediately preceding the very statement made by the International Waterways Commission as to the refusal of appellant to furnish it the records, is the further observation that it was not material to the matters under consideration by the Commission, and that the Commission believed the diversion to be greater than 4,167 cubic feet per second. The report stated (Rec., Vol. VII, p. 253):

> "The flow through the canal since June, 1904, has been assumed to be 4,167 cubic feet per second, the quantity authorized in the permit of the Secretary of War. It is believed to have been greater, but the difference is not sufficient to vitiate the results sought for here."

Had the Commission considered appellant's records material for its investigation, an application to the President of appellant's Board of Trustees, or to the Board itself, would undoubtedly have obtained the desired records of flow. They were public officers, not personally interested.

Furthermore, Mr. Isham Randolph, the chief engineer of appellant from the time of the opening of its Sanitary and Ship Canal to 1907, and Mr. George M. Wisner, appellant's chief engineer from that time until about the year 1920, both testified as to the volume of flow through the Chicago River, and the Sanitary and Ship Canal, and the circumstances thereof. No question was asked of them by appellee as to whether the records of flow had ever been refused appellee, or any one else.

(13) The effect of the Calumet Sag permit of June 30, 1910, has been elsewhere considered. (Infra, p. 65.)

(14) The effect of the application of Secretary of War Stimson's refusal of May 8, 1910, to remove the limitation of December 5, 1901, and formally authorize the diversion of 10,000 cubic seconds feet, has been fully considered by us under Point VIII of our argument. (Our original brief, p. 205.)

(15) The works for the diversion of 10,000 cubic seconds feet through the Chicago River and its branches to the Sanitary and Ship Canal, had been substantially completed when the application of February 5, 1912, and the refusal of January 8, 1913, by Secretary of War Stimson, were made, and the Main Channel suit—October 6, 1913—was commenced.

(16) The record does not disclose any delays caused by appellant in the final disposition of this case, and *there were none.*

Appellee again cites the *Wheeling Bridge case,* 13 Howard 553, which has been fully discussed and distinguished by us. (Infra, p. 54.)

In

Monongahela Navigation Co. v. *United States,* 148 U. S. 312,

this Court held that the United States should pay the Navigation Company compensation for the destruction of the canal built by it pursuant to legislation of the State of Pennsylvania and the invitation of the United States. In summing up the facts, this Court said (p. 334):

> "But in this case there was not only the full authority of the state of Pennsylvania, but also so far as respects this particular lock and dam they were constructed at the *instance* and *implied invitation* of *Congress.* The Act of March 3, 1881, making an appropriation for the improvement of the rivers, in terms provided that no such improvement should be made until the Navigation Com-

pany had in good faith started upon the building of this lock and dam. *This lock and dam connected* the *lower* improvements *already* made by the Navigation Company with the *upper improvements proposed* to be made by Congress, and the appropriation by the latter was conditioned on the company's undertaking their construction. This is something more than the mere recognition of an existing fact; it is an *invitation* to the company to *do* the *work;* and *when* in *pursuance* of that *invitation*, and under *authority* given by the state of *Pennsylvania*, the company has *constructed* the lock and dam, it does *not lie* in the power of the state or the *United States* to *say* that *such* lock and dam are an *obstruction* and *wrongfully* there, or that the right to compensation for the use of this improvement by the public does not belong to its owner, the Navigation Company."

What were the Acts of Congress and of the officers of the United States that constituted the invitation to the Monongahela Navigation Co.? On March 3, 1881, Congress, by an act, appropriated $25,000 for improving the Monongahela River in West Virginia and Pennsylvania, provided that (p. 315):

"* * * this sum shall not be expended until the Monongahela Navigation Company shall have undertaken in good faith the building of lock and dam number seven at Jacob's creek, and until said company shall, in manner satisfactory to the Secretary of War, give assurance of their ability and purpose to complete the same."

Thereafter, on March 24, 1881, the United States engineer officer in that district wrote the Navigation Company reciting the Congressional Act mentioned, asking that the Navigation Company proceed in good faith to build the lock and dam.

We have heretofore shown (*infra*, pp. 104 to 110) Appellant's Statement, Original Brief, pp. 18-22, 48-59) the invitation extended by various acts of Congress in making surveys and requiring reports, and by the reports themselves, to construct the link in this waterway from Lake Michigan across the continental divide to the Desplaines River.

In addition, by Congressional Acts in providing for the improvement of the Chicago River, Congress invited the co-operation of appellant in deepening and widening the channels of the South Branch and the West Fork to conform to the Government's plan and project for the improvement of navigation on the Chicago River and its branches. It is admitted by the pleadings (Appellant's Narrative, pp. 18, 39) that $4,216,066.36 was expended by the United States in the improvement of the Chicago River and Harbor, and that $1,626,539.20 of said amount was expended on the Chicago River proper. This latter amount was expended from 1896 to 1913. The facts, which are undisputed in this record, as to the Government's work on the Chicago River and the South branch covering the period from 1896 to 1913, are stated by the witness George M. Wisner (Appellant's Narrative, pp. 184-186):

"The Government did not expend any money in connection with the improvement of the Chicago River until 1896.

Since 1896 the United States expended, up to say June 30, 1913, in the improvement of the Chicago River itself approximately $1,626,000.

It was expended for dredging the North and the South Branches to a depth of 17 feet on the first project, and later the deepening of the North Branch as far north as Belmont avenue, I think, to a depth of 20 feet.

The Government also bought some land on both branches of the river for the purpose of constructing what is known as turning basins. These are basins that are large enough so that vessels can turn around and come back down the river bow first. The one on the North Branch is at Diversey boulevard, and the one on the South Branch is at the junction of the West Fork and the South Branch, just east of Ashland Avenue. Part of this money on the original project was expended for widening the Chicago River at some of the narrowest and most dangerous places. Part of this money was expended deepening the main branch of the river to a depth of 20 feet from the mouth to the junction of the

two branches. Generally this covers the money that was expended by the Government for the improvement of the river.

The City of Chicago has expended in the improvement of the Chicago River approximately $6,275,000.

From about 1861 to the present time, approximately to this time it was expended for dredging of the Chicago River, both the main river and on all its branches, building of bridges and docks, and general improvements.

These improvements in the Chicago River were done by the United States Government during the time that the Sanitary District was completing its works—particularly the South Branch. The deepening of the North Branch has been done in quite recent years; that is deepening the North Branch to 20 feet.

Since the 17 foot project of the United States Government it has done no work on the South Branch, although it has deepened the North Branch to 20 feet. *The Sanitary District took up its work and did this dredging.* When the Sanitary District started on this project, the Government had not quite completed the dredging to 17 feet. It was widening the river at certain places where it was narrow, that is the South Branch. *Some of this work of the Government and the Sanitary District was carried on simultaneously. The widening done by the Government however was at a few places, and did not amount to very much.*

The Sanitary District commenced its work on the improvement of the Chicago River along about 1896."

Let us now examine the Congressional Acts concerning the Chicago River improvement in cooperation with and inviting the appellant to deepen and widen the South Branch of the Chicago River and the West Fork of the South Branch.

The first item looking to the improvement of the Chicago River appears in the Rivers and Harbors Bill of July 13, 1892, (Vol. 1, Laws, Improvement of Rivers and Harbors, p. 611; United States Stat. at L. Vol. 27, p. 88,) as follows (619):

"Improving harbor at Chicago, Illinois: Completing improvement, seventy-two thousand dollars; and the en-

gineer in charge of the harbor is directed, in his next report, to submit what, if any, improvement should be made by the Government in Chicago River, and the cost of same."

The Rivers and Harbors Act of August 18, 1894, (Vol. 1, Laws, Improvement of Rivers and Harbors, p. 677; United States Stat. at L. Vol. 28, p. 338,) contains the following item (685):

> "Improving harbor at Chicago, Illinois: Completing improvement, eighty thousand dollars; and the Secretary of War may, in his discretion, use twenty-five thousand dollars of this sum in the improvement of Chicago River up to the forks of said river."

The Rivers and Harbors Act of June 3, 1896, (Vol. 1, Laws Improvement of Rivers and Harbors, p. 743; United States Stat. at L. Vol. 29, p. 202), contained the following (781):

> "For improving the Chicago River, in Illinois, from its mouth to the stock yards on the South Branch and to Belmont Avenue on the North Branch, as far as may be permitted by existing docks and wharves, to be dredged to admit passage by vessels drawing sixteen feet of water, according to the recommendation of Captain W. L. Marshall, of the Corps of Engineers of the United States Army, in his report under date of August ninth, eighteen hundred and ninety-three."

It is important now to examine the report of Captain Marshall of August 9, 1893, especially mentioned in said Act. This report mentioned the Sanitary and Ship Canal then under construction, as follows (Appellant's Narrative, p. 457):

> "To remedy the, at times, insupportable and disgusting condition of the river and its branches; to purify the river and to preserve the city water, relief is now sought under state laws by constructing a drainage canal from the south branch of Chicago River to the Desplaines River above Joliet, capable of discharging into the Illinois River Valley from three hundred thousand to six hundred thousand cubic feet of water per minute.
>
> * * *

This channel has been located from the south branch of the Chicago River to Lockport, and is under construction, but no provision has yet been made for channels of supply from Lake Michigan. Whatever the outcome or plans of the local officials having this work in charge may be, it can be said that the Chicago River and its branches cannot in their present condition, supply materially more than from one-third to one-half of the minimum requirements of the law, without producing currents that will be prohibitory to navigation at some of the bridges and obstructions now existing.

It is certainly evident, granting the proposition that effective channels for the purpose will be constructed, that if this method of solving the drainage problem is to be carried to conclusion, there must be a complete remodeling of Chicago River throughout both its branches, and there must be also artificial channels of large capacity to furnish even approximately effective outfalls to the sewerage systems of a great city founded on low lands extending some twenty-two miles long, and for miles back from the lake, as well as other large feeders connecting the lake with such channels."

The importance of some time improving these rivers to provide a depth of twenty to twenty-one feet was mentioned; also the removal of the docks and bends in widening the river. The tunnels under the river necessary to be removed were mentioned (Appellant's Narrative, pp. 458-460). The report also stated that it would be necessary to rebuild bridges over the river and to consider the extension of navigation from the Illinois River to Lake Michigan (Appellant's Narrative, pp. 460, 461). The report recommended that immediately the Chicago River from its mouth to the stock yards on the South Branch and to Belmont Avenue on the North Branch should be improved and dredged to admit passage by vessels drawing sixteen feet of water, and that encroachments by persons building docks into the river and that obstructive bridges should be limited. This recommendation only covered the immediate necessities. The greater development for twenty and twenty-one feet by the removal of tunnels

and the dredging and widening of the Chicago River and its branches was definitely contemplated and *suggested* by the report.

The Rivers and Harbors Act of February 26, 1897, (Vol. 2, Laws, Improvement of Rivers and Harbors, p. 807; United States Stat. at L. Vol. 29, p. 597), contained the following item (813):

> "Improving Chicago River, Illinois: For continuing improvement from its mouth to the stock yards on the South Branch and to Belmont Avenue on the North Branch, one hundred and thirteen thousand dollars, in pursuance of the provisions of 'An Act making appropriations for the construction, repair, and improvement of certain public works on rivers and harbors, and for other purposes,' approved June third, eighteen hundred and ninety-six; and it is hereby declared to be the true intent and meaning of the said provisions of said Act relating to the improvement of said Chicago River that all of the work in the improvement of said river which *was recommended or suggested* to be done in the interest of commerce by Captain William L. Marshall, of the Corps of Engineers of the United States Army, in his report of August ninth, eighteen hundred and ninety-three, may be done."

The Rivers and Harbors Act of July 1, 1898, (Vol. 2, Laws, Improvement of Rivers and Harbors, p. 827; United States Stat. at L. Vol. 30, p. 597), contained the following (830):

> "Improving Chicago River, Illinois: For continuing improvement from its mouth to the stock yards on the South Branch, and to Belmont Avenue on the North Branch, four hundred thousand dollars."

The Rivers and Harbors Act of March 3, 1899, (Vol. 2, Laws, Improvement of Rivers and Harbors, p. 843; United States Stat. at L. Vol. 30, p. 1121), contained the following item (895):

> "Improving Chicago River, in Illinois: Survey and estimate of cost *for a channel twenty-one feet deep* from its mouth to the *stock yards on the South Branch*, and to Belmont Avenue, on the North Branch, so far as may be

permitted by existing docks and wharves, exclusive of cost of removing or constructing bridges or piers or lowering tunnels; and the aforesaid *depth of twenty-one feet is hereby adopted as the project depth for the improvement in lieu of that fixed by the Act of June third, eighteen hundred and ninety-six:* Provided That all the work of removing and reconstructing bridges and piers and lowering tunnels necessary to permit a practicable channel with said depth to be obtained shall be done, or caused to be done, by the City of Chicago without expense to the United States."

It will be recalled that this very item of said Rivers and Harbors Act was under consideration by this Court in

Chicago Street Ry. Co. v. *Chicago,* 201 U. S. 505,

wherein the Court held that Congress itself had given assent to the removal of the tunnels and the Secretary of War's authority was unnecessary. This included the reconstruction of bridges therein mentioned. It would apply, also, necessarily to the work of appellant of deepening and widening the South Branch and the West Fork of the South Branch of the Chicago River to conform to the project adopted by Congress. However, the consent of the Secretary of War for this work was in every respect obtained.

The Rivers and Harbors Act of June 6, 1900, (Vol. 2, Laws, Improvement of Rivers and Harbors, p. 926; United States Stat. at L. Vol. 31, p. 588), contained the following item (927):

"Improving Chicago River, Illinois: For continuing improvement from its mouth to the stock yards on the South Branch, and to Belmont Avenue on the North Branch, sixty-two thousand dollars."

The Rivers and Harbors Act of June 13, 1902, (Vol. 2, Laws, Improvement of Rivers and Harbors, p. 949; United States Stat. at L. Vol. 32, p. 331), contained the following item (994):

"Improving the Chicago River, Illinois: Continuing improvement, three hundred and six thousand four hundred and fifty-seven dollars."

The Rivers and Harbors Act of March 3, 1905, (Vol. 2, Laws, Improvement of Rivers and Harbors, p. 1080; United States Stat. at L. Vol. 33, p. 1117), as to a survey, contained the following item (1127):

> "West Fork of the South Branch of the Chicago River, with a view to securing a twenty-one foot channel."

The Rivers and Harbors Act of March 2, 1907, (Vol. 2, Laws, Improvement of Rivers and Harbors, p. 1220; United States Stat. at L. Vol. 34, p. 1073), contained the following item (1259):

> "Improving Chicago River, Illinois: Continuing improvement and for maintenance, three hundred thousand dollars."

The Rivers and Harbors Act of June 25, 1910, (Vol. 2, Laws, Improvement of Rivers and Harbors, p. 1381; United States Stat. at L. Vol. 36, p. 630), contained the following item (1417):

> "Improving Chicago River, Illinois: Continuing improvement and for maintenance, one hundred and seventy-five thousand dollars."

The Rivers and Harbors Act of February 27, 1911, (Vol. 2, Laws, Improvement of Rivers and Harbors, p. 1460; United States Stat. at L. Vol. 36, p. 933), contained the following item (1479):

> "Improving Chicago River, Illinois: For maintenance, thirty-four thousand dollars."

The Rivers and Harbors Act of July 25, 1912, (Vol. 2, Laws, Improvement of Rivers and Harbors, p. 1521; United States Stat. at L. Vol. 37, p. 201), contained the following item (1567):

> "Improving Chicago River, Illinois: For continuing improvement, $28,000."

The Rivers and Harbors Act of March 4, 1913, Vol. 2, Laws, Improvement of Rivers and Harbors, p. 1574; United States Stat. at L. Vol. 37, p. 739, contained the following item (1596):

"Improving Chicago River, Illinois: For maintenance, $10,000."

The Rivers and Harbors Acts of August 1, 1914, (U. S. Stat. at L. Vol. 38, p. 636), July 27, 1916, (U. S. Stat. at L. Vol. 39, p. 401), August 8, 1917, (U. S. Stat. at L. Vol. 40, p. 258), and March 2, 1919, (U S. Stat. at L. Vol. 40, p. 1283), all contained small items making appropriations for the maintenance of the Chicago River.

It will be noted that after the year 1912, no appropriation was made for the further enlargement of the Chicago River, its North Branch, South Branch and West Fork, as at that time the 1920 and 1921 foot project had been completed. **The United States had done its work as provided by the project of Congress in the Chicago River proper and in the North Branch. Appellant had enlarged the South Branch and the West Fork according to the same project of Congress, which enlargement of said South Branch and West Fork was connected with and was a part of appellee's improvement of the Chicago River proper and of the North Branch. The appropriations thereafter were for maintenance only.**

The foregoing demonstrates not only an invitation to appellant to make the improvements in the South Branch and West Fork of the Chicago River to carry out the project of Congress for the improvement of those rivers to 20 and 21 foot depth, removal of tunnels, reconstruction of bridges, but also the actual cooperation of appellee through Congress with appellant, as appellant was doing its work of enlarging the channels of these rivers. The work done by appellant in deepening and widening the South Branch and West Fork, according to the project adopted by Congress, connected with, and was a part of, the work done by appellee in deepening

and widening the Chicago River proper and the North Branch. The invitation of appellee to appellant to carry out the work necessary for the diversion of 10,000 cubic seconds feet of water from Lake Michigan, is much stronger than that mentioned in

Monongahela Navigation Company v. *United States, supra.*

Appellee's Point VIII-A.

(Its Brief, p. 263.)

The authorities cited here do not apply, for appellant did not induce, by act or representation, appellee to acquiesce in the construction of the works for the diversion.

Appellee's Point VIII-B.

(Its Brief, p. 267.)

In

Union Bridge Company v. *United States,* 204 U. S. 364,

cited by appellee, there was express authority given the Secretary of War under Section 18 of the Rivers and Harbors Act of 1899 to require the alteration of bridges theretofore constructed.

Here again appellee fails to observe that there has been no congressional action revoking the rights of appellant as existed in the case of

United States v. *Chandler Dunbar Company,* 229 U. S. 51.

Appellee knew at all times that appellant was proposing to divert at least 10,000 cubic seconds feet of water through the channels of the Chicago River and its branches to the Sanitary and Ship Canal; that it was constructing its works

for that purpose, and was deepening and widening the river channels in order that its purpose might be physically accomplished.

Appellee's Point VIII–C.

(Its Brief, p. 270.)

Counsel bases its argument upon a false premise, namely, that there has been a revocation. Congress has done nothing. The United States is moved here solely by the action of executive officers. The Secretary of War has, not even, attempted any revocation of appellant's rights.

Appellee was not misled. Appellee knew for what purpose appellant was enlarging the channels of the Chicago River and its branches. It knew that one of the purposes of the construction by appellant of its works with the attendant diversion of water from Lake Michigan, was the disposal of sewage and drainage so that it would not reach Chicago's water supply. The Secretary of War granted the permits, with the understanding, which is the law, that Congress might thereafter regulate the entire situation, at which time only would the appellant's diversion works be subject to Federal regulation.

Counsel say, (Appellee's Brief, p. 282) that the fixing of the reference plane for the improvement of the channels of the Great Lakes six inches lower is unimportant. We called attention to this to show that Congress itself, in fixing this reference plane for the improvement of these channels, accepted the Chicago diversion and sought to offset for any effect upon the lakes' surfaces that it was claimed would take place. We are unable to see how the action of executive officers can set at naught this plain congressional acquiescence.

APPELLEE'S POINT IX.

(Its Brief, p. 283.)

Appellee's counsel having now consumed 282 printed pages in, as they believe, establishing their right in this court for an affirmance of the decree below, without, however, meeting categorically a single argument of appellant, and believing that it is now the time to deliver the last and fatal solar plexus blow, and deprive appellant of its last heart throb, assert that the injunction should be *effective immediately* and *without condition;* and that appellant be at once forever *restrained, without condition,* from diverting more than 4,167 cubic seconds feet from Lake Michigan.

This position is sought to be maintained in face of the admitted facts in this record, that the immediate limitation of the diversion as prescribed by the injunction, would cause pollution of Chicago's drinking water supply, resulting in the rage of typhoid fever and other water born diseases, public nuisances in the Chicago River, Sanitary and Ship Canal, Des Plaines and Illinois Rivers, creation of diseases along those rivers, destruction of fish life in the Illinois River and generally havoc in this community. A guess, as to the extent of the damage to result from the limitation of the diversion as stated, is beyond the power of a human being to hazard.

Appellee's Point IX-A.

(Its Brief, p. 284.)

Counsel for appellee discuss the right of the Attorney General to institute suit for an injunction, and thus the jurisdiction of the court. The question of jurisdiction of a Federal court, may be at any time raised, and the court will do so of its own motion.

Osborn v. *Bank of U. S.*, 9 Wheaton 738.

Wayman v. *Southard*, 10 Wheaton 1.
United States v. *Moore*, 3 Cranch 159.
Wilson v. *Mason*, 1 Cranch 45.
Mansfield C. & L. M. R. Co. v. *Swan*, 111 U. S. 379.
Bors v. *Preston*, 111 U. S. 252.
Morris v. *Gilmer*, 129 U. S. 315.
Pepper v. *Fordyce*, 119 U. S. 468.
Union Iron Bridge & Mfg. Co. v. *Otoe County*, 120 U. S. 225.
Mississippi & Run River Boom Co. v. *Patterson*, 98 U. S. 403.

Jurisdiction cannot be conferred by consent of the parties. There is no consent here.

The Secretary of War, in the June 30, 1910, permit as to the Calumet Sag Channel, may have called the Calumet River suit filed March 23, 1908, a friendly suit. We have not discovered a condition of this kind at any point in this litigation. Furthermore, the Calumet River suit has ceased to be of any particular concern to anyone, in view of the later Main Channel suit of October 6, 1913, involving all diversions through the channels of the Chicago River and its branches to the Sanitary & Ship Canal, and, also, through the Calumet River and the Calumet Sag Channel.

The statement by counsel of the facts and holding of this court in

Economy Light & Power Company, 256 U. S. 113, (Appellee's Brief, p. 285),

furnishes its distinction. There the suit was to remove a part of a structure, which is expressly provided for under Section 12 of the Act of 1899. Necessarily, if the court had obtained jurisdiction by proper action to remove a structure or a part of a structure, as specifically provided by the said section of said act, then the decree could be made effective

by enjoining the defendant from thereafter constructing the same or a like structure.

U. S. v. *Rio Grande Dam & Irrigation Company, supra,*

is not an authority in support of appellee's contention for in that case the action was brought under the express provision of Section 10 of the 1890 Act authorizing the Secretary of War to institute a suit for injunction to enjoin the **creation** of an **obstruction.** That case had been instituted prior to the passage of the Act of March 3, 1899. In fact it was first argued in this court in November, 1898, and decided May 22, 1899. In withdrawing from the Attorney General the broad powers which entitled the Attorney General to institute the Rio Grande Dam & Irrigation Company suit, Congress expressed an intention that the Attorney General should not thereafter exercise such broad powers. Thus it restricted the Attorney General's powers under the new act of 1899, and, evidently, expected the penal clauses of the statute to be a sufficient safeguard.

We do not believe that the statement by appellee's counsel (Appellee's Brief, p. 290), that the provisions of Section 12 of the 1899 Act did not supersede and repeal similar provisions of Section 10 of the 1890 Act, is seriously presented.

Counsel again cite the

Wheeling Bridge case, 13 Howard 553, (Appellee's Brief, p. 292).

How that case can be treated as having any application on the question whether the Attorney General has authority to institute this suit cannot be determined by us. That suit was instituted by the sovereign State of Pennsylvania, under the express provision of the Constitution giving this court jurisdiction as to controversies between the states.

In re Debs, 158 U. S. 564,

cited and quoted at length by appellee (Appellee's Brief, p. 293-297) related to the protection of the property of the

United States and the carrying of the mails. Furthermore, there were no statutory provisions prescribing what the Attorney General might do, as there is here.

Appellee's Point IX-B.

(Its Brief, p. 297.)

Comparative Injury.

It must be borne in mind that the sole legal proposition asserted in this case by appellee, is that, appellant, having been found here, without the affirmative authorization of the Secretary of War for a diversion of 10,000 cubic seconds feet of water from Lake Michigan, the injunction must issue as a matter of course. In what manner this authorization failed, is entirely immaterial, on appellee's theory. Of course, as we have pointed out extensively in our original brief herein and in this reply brief, that authorization was obtained. Appellee's counsel assert that it is unnecessary for appellee to show or even allege, material alteration or modification of the navigable waters of the United States or material injury to navigation; that all that is required, is that there is an alteration or modification of such navigable waters. To what extent, is beside the question. The case relied upon so much by them (*United States* v. *Rio Grande Dam & Irrigation Company*, 174 U. S. p. 690), does not uphold their contention, for there this court sent the case back for further evidence to determine whether the injury to navigation by the construction and operation of the dam, would be unreasonable.

Counsel fail, we believe, to appreciate that the powers exercised by the State of Illinois for the construction and operation of appellant's works, are just as necessary for the maintenance and preservation of the union, as those powers exercised by Congress under the commerce laws of the Constitution. This Court will reconcile the actions of the two sovereignties.

As has been so admirably stated by The Solicitor General in his valuable work entitled "The Constitution of the United States," recently published, this court is in the nature of a continuation of the constitutional convention. It is a tribunal where the great questions, involving the interpretation of the Constitution in its application to the states, may be individually settled. In many instances the exercise by the state of its police power in some manner and to some extent affects the exercise of Federal power. A very excellent example is the construction of bridges over navigable streams. It is necessary for the welfare of the state that these navigable waters shall be bridged. Yet they do obstruct navigation.

In the case of

Escanaba Transportation Company v. *Chicago*, 107 U. S. 678,

an ordinance of Chicago, closing bridges certain hours of the day, was upheld; yet interstate commerce was affected. The comparative injury that would result to the commerce of the United States and the injury to the City of Chicago and State of Illinois by not closing the bridges at those hours, was necessarily an important question to be considered in that case. And Congress has not in any way sought to regulate diversions of or the use of navigable waters for sanitary purposes and in the interest of public health.

Counsel are asking this court to uphold the mere fiat of a bureau of the Federal Government, which bureau has as its head the Chief of Engineers of the United States Army, because the Chief of Engineers failed to recommend in 1912 the removal of the limitation of the diversion of December 5, 1901, and thereupon the authorization of a diversion of at least 10,000 cubic seconds feet of water through the channels of the Chicago River and its branches to the Sanitary and Ship Canal. And this request of appellee's counsel is in the face of the admitted facts—colossal damage to appellant.

Appellee's Point IX-C.

(Its Brief, p. 302.)

Appellant, by making the offer contained in its motion of July 12, 1920, in connection with the settlement of the decree, was merely seeking to compose a controversy. It is not going to carry its corporate entity to the St. Clair or Niagara or St. Lawrence Rivers and build compensating or regulating works there, but proposes merely to pay a sum of money which shall equal the cost of constructing and maintaining such works, in order to compromise a lawsuit. What we ask the court to do, is to say to appellee:

> "You cannot have your injunction to the full extent you ask, when appellant offers to do a thing which will, in every way under the admitted facts in this case, make you entirely whole."

And it must also be remembered that Congress may, thereafter, interpose itself in this matter, if the solution proposed is not to its liking.

Counsel (Appellee's Brief, p. 304) discuss the Treaty of January 11, 1909, and assert that the remedial works cannot be constructed without the consent of the Joint Commission, and quote Article 4 of the Treaty. The very clause of that article quoted, provides that neither government shall construct remedial works on its own side of the boundary which shall have the effect of raising the *natural* levels of the water on the other side. If appellee's contention is correct, that this diversion reduces the levels below their natural levels, and the only purpose of the remedial works is to place the levels in the same condition as if the diversion did not exist, then there would be no raising of

> "the natural levels of waters on the other side of the boundary."

But whether it is necessary to obtain the consent of the Joint Commission or anyone else, is immaterial for the ad-

mitted facts in this case are that the effect of the Chicago diversion may be entirely compensated for by the construction of these remedial works. Therefore, if consent is refused, it would be for no good or valid reason, and appellant should not be, in that event, unnecessarily injured by the absence of such consent.

Counsel say (Appellee's Brief, p. 305) that the decree which appellant proposes could not be enforced. We apprehend no difficulty in the settlement of a decree which would make it a condition that appellant pay to the United States such an amount as the Secretary of War or some officer or tribunal of the United States, should determine the cost of the remedial works to be when they were properly authorized by Congress, or by such other authority as would be necessary. The diversion of the full 10,000 cubic seconds feet would be subject to those conditions.

Appellee's Point IX-D.

(Its Brief, p. 310.)

Again, notwithstanding the matter stated by appellee, in its conclusion to its brief (p. 316), it requests that the injunction be immediately made effective. Counsel again refer to a motion to strike certain portions of appellant's answer. The record does not disclose that any such motion was ever presented to the lower court. Notice that a motion would be entered was given February 28, 1914, (Rec. Vol. 8, p. 126), but no motion was ever filed and no order was ever entered passing upon any such motion.

The facts in support of our contention in this respect, as to the postponement of the time the injunction should be made effective, are undisputed in this record.

There is no suggestion by us that this court in any manner by sustaining appellant's position would take anything from

Congress, as counsel asserts (Appellee's Brief, p. 313). Congress still has the right, if it chooses, as it has had the right for over a third of a century since these works have been under construction or in operation, to regulate them and the amount of diversion, if appellant's action is not in keeping with its wishes.

APPELLEE'S CONCLUSION.

(Its Brief p. 316.)

The conclusion of appellee's brief makes a most remarkable suggestion; namely, that the Court, notwithstanding the admitted equities of this case in appellant's favor, confirm the lower court's decree as it now exists without prejudice to the Chief of Engineer's recommending, and the Secretary of War's granting authority for, the diversion from Lake Michigan required by appellant, until Congress may at either this coming session of the present Congress, or at the next Congress, exercise its power to regulate the Chicago diversion under the Commerce Clause of the Constitution. Counsel suggest that this Court disregard the fundamental principle of constitutional law,—that until Congress acts, the state's exercise of its reserved power is lawful. Appellee's counsel thus would make the rule,—that the state's exercise of the reserved power is lawful, *only for a limited time,* namely, the end of the next Congress. What would happen if Congress did not act within the time mentioned, counsel do not disclose. We presume, according to counsel's suggestion, the decree would then be effective without *any condition.*

This concession of the law officers of the United States is no more than the concession which the Secretary of War and the Chief of Engineers were prepared to make, when Judge Landis gave his opinion herein, at which time a memorandum from the Chief of Engineers, approved by the Secretary of War, was submitted to the Trustees of The Sanitary District, dated July 21, 1920. This appears from the letter of Col. Wm. V. Judson, of May 24, 1921, to the Chief of Engineers (Appellant's Narrative, p. 351):

> "14. In regard to the contention of the Sanitary District that it is necessary to divert more than 4,167 cubic feet per second in order to avoid contamination of

the City water supply and consequent epidemics, I was empowered in a memorandum of the Secretary of War for the Chief Engineers dated July 21, 1920, to say **'that if Judge Landis' decree is accepted as final, the War Department will issue no permit, since it is without legal power to do so, but will ask no further orders from the Court to enforce the limitation so long as the City of Chicago proceeds with dispatch to prepare plans and put them into process of execution for its sewage system. If the City of Chicago then prepares plans and consents to the War Department having current knowledge of its activity, either by reports to the courts or otherwise, the situation will be under the control of Judge Landis until the whole problem is disposed of. If, however, the City of Chicago proposes to appeal the case and takes no steps pending the appeal to cure the trouble, Colonel Judson should be instructed to make no concessions or promises of any kind.'** This memorandum of the Secretary of War was obtained through the Chief of Engineers at my solicitation for use whenever Judge Landis decides to finish the hearing on Attorney Adcock's arguments for allowing a total diversion of 10,000 second feet. In this connection Mr. Adcock was making the argument that the War Department would be arbitrary in acting on the findings of the court, and a statement was desired which would show that the Secretary of War would not be arbitrary in the matter. * * *

A second conference was held on February 7, 1921, at which the United States Attorney was represented by his assistant, Mr. J. B. Boddie. The proposal of the Secretary of War as embraced in the last paragraph of his memorandum of July 21, 1920 (E. D. 98093/657), was discussed and the Sanitary Trustees stated that they were unable to accept the proposition that Judge Landis' decree be accepted as final. On the other hand they stated that they would proceed diligently in the preparation and execution of plans for the treatment of sewage within the Sanitary District."

Obviously, the corporate officers of appellant could not, in the manner suggested, give away, through this proposed bargain, the fundamental rights of the people of this community.

We respectfully submit that the willingness to make these concessions demonstrates that the real basis for this litigation is not the injury alleged to result from appellant's diversion, but rather the desire to place in the hands of the Chief of Engineers of the U. S. A., this extraordinary power claimed for his in Appellee's Brief.

Undoubtedly counsel was moved to make this suggestion as to affirmance of the decree without prejudice to the Chief of Engineer's and Secretary of War's action, because of lack of faith in their position taken under Point IX (that the decree should be effective *immediately* and *without condition*). They are forced to admit that this Court could not, in justice and in keeping with its precedents, fail to do that justice to appellant which the facts warrant; that the enforcement of the lower court's decree without granting the necessary reasonable time to appellant and other municipalities within its territory, to readjust themselves to the condition of the limitation of diversion to 4,167 seconds feet, would be unjust, inhuman and not in accordance with equitable principles; that the time stated by appellant and the other municipalities that would be required to make changes, (*uncontradicted by the record*), is reasonable and proper. But notwithstanding their institution of these suits and their selection of the forum, appellee's counsel suggest that in some other place than this court, sitting as a court of equity, that justice, to which appellant is entitled, may be obtained.

In order that this great community may be relieved of an intolerable situation pending Congressional action, the Chief of Engineers would first be required to recommend the granting of authority by the Secretary of War, and thereafter the Secretary of War, on such recommendation, would be required to authorize the diversion. The Chief of Engineers may or may not recommend, and after his recommendation, the Secretary of War may or may not authorize the diversion. There are no prescribed rules or regulations under

which the Chief of Engineers or the Secretary of War shall act. These officers may refuse to act for any reason or reasons that to them seem justifiable, whether the reasons are sound, or are without any foundation.

In this connection we call attention to the very pertinent language in

Willamette Iron Bridge Co. v. *Hatch*, 125 U. S. 1, 16,

referring to this Court's decree in the *Wheeling Bridge case*, 13 Howard 518, permitting time in which to change the bridge, and, in speaking of the claim of Virginia, that it could do with the Ohio River as it chose within its boundary, this Court said (page 16):

> "This plea, therefore, presented not only a great question of international law, but whether rights secured to the people of the United States by compact made before the Constitution, were held at the mercy or caprice of every or any of the States to which the river was a boundary. The decision of the court denied this right. The plea being insufficient as a defense, of course the complainant was entitled to a decree prostrating the bridge, which had been erected *pendente lite*. But to mitigate the apparent hardship of such a decree, if executed unconditionally, the court, in the exercise of a merciful discretion, granted a stay of execution on condition that the bridge should be raised to a certain height, or have a draw put in it which would permit boats to pass at all stages of the navigation."

Appellee attempts to distinguish the action of the Court in the *Wheeling Bridge case* from appellant's suggestion that time be permitted for readjustment, by stating that, in the *Wheeling Bridge case*, Pennsylvania was suing only as a private litigant and there was no question of enforcement of paramount authority. Our examination of the facts of the *Wheeling Bridge case* does not disclose grounds for the distinction sought, as the *Wheeling Bridge case* turned principally upon the compact between Virginia and Kentucky, confirmed by Congress. This compact was treated as con-

gressional legislation defining the character of the Ohio River as a navigable stream, and of the bridge, violating this Act of Congress, Pennsylvania could complain. Counsel further fail to give consideration to the cases cited by us in our original brief (page 185),—*that the United States cannot expect the courts of its own creation to give in its behalf more favorable consideration than they would show to other litigants.*

Counsel in their brief (page 320) assert that it was not necessary to call upon a court of equity to enforce the supposed limitation of the Secretary of War of December 5, 1901, and counsel do not state, but we presume they mean, the army might have been called upon to proceed to the site of this diversion and take possession of appellant's works, and take such action as would be necessary to limit that diversion to 4,167 seconds feet. We doubt whether counsel are serious in this statement, in view of the provisions of Section 12 of the Rivers and Harbors Act of March 3, 1899, specifying what may be done in the event structures are placed in navigable waters without the authority of the Secretary of War. There are two remedies—namely, (1) as to structures—a suit for an injunction; and (2) as to structures and obstructions—penal action. No other remedies are provided, and there are none. How the army could be called into action counsel do not enlighten us. We know of no Act of Congress authorizing any officer of the United States to take such action.

CONCLUSION.

Counsel's claims for the affirmance of the decree below are based upon the contention that the appellant is without the authority of the Secretary of War for this diversion; that it is a condition precedent to the appellant's right to divert this water that it have this authorization. They have not met our argument that the Rivers and Harbors Act of March 3, 1899, does not in those plain and unmistakable terms required indicate the intention of Congress to exercise jurisdiction over diversions of water at Chicago, or the use and diversion of water for sanitary purposes. Our argument remains unassailed, that, assuming the Act of March 3, 1899, delegates to the Secretary of War authority to regulate diversions, he has not, in the clear manner required, limited the diversion to the amount fixed by the District Court's decree, because of the conflict between the December 5, 1901, supposed limitation and the permits of July 11, 1900, for the enlargement of the Chicago River. In referring to this diversion, this Court, in

Missouri v. *Illinois*, 200 U. S. 496, 519,

said:

> "In the case at bar, whether Congress could act or not, **there is no suggestion that it has forbidden the action of Illinois.**"

The supposed limitation of the diversion by the order of December 5, 1901, the basis of the Attorney General's suit here, is a mere shadow. This court will not give force and effect to such action of an administrative officer, as it stated in

Interstate Commerce Commission v. *Illinois Central R. R. Co.*, 215 U. S. 452, 470—

> "Beyond controversy, in determining whether an order of the Commission shall be suspended or set aside,

> we must consider * * * and (c) a proposition which we state independently, although in its essence it may be contained in the previous one, viz., whether, even although the order be in form within the delegated power, nevertheless it must be treated as not embraced therein, because the exertion of authority which is questioned has been manifested in such an unreasonable manner as to cause it, in truth, to be within the elementary rule that the substance, and not the shadow, determines the validity of the exercise of the power."

Appellant's diversion required by state law is authorized under the March 2, 1827 Act. The Secretary of War has actually granted the permission (May 8, 1899) which appellee's counsel claim was required. The conditions of this permit have been entirely fulfilled by appellant; appellee cannot base any right upon the limitation of the Secretary of War's order of December 5, 1901, made almost a quarter of a century ago, in view of congressional action and appellant's enlargement of the Chicago River as authorized by the Secretary of War.

Counsel refer to delays in this litigation and attempt to lay the blame therefor upon appellant, the fallacy of which we have heretofore shown, and they state (Appellee's Brief, p. 320):

> "and the patience with which it has accepted the inordinate and inexcusable delays in this litigation show the keen desire of the Government that no possible injustice should be done to the people of Chicago."

For upwards of a third of a century, during the construction and operation of this Canal, Congress, (advised and notified by its own officers of the initiation of the project, of the progress of the work, its purposes, probable effects upon the Great Lakes and claimed injuries to navigation), to whom power to regulate commerce was delegated and who could have acted, not only did not act adversely, but, on the contrary, passed acts recognizing the diversion. The

delay mentioned by counsel shows the lack of any real basis for appellee's claim to an injunction, and demonstrates that the person really concerned is the Chief of Engineers of the United States Army who seeks sanction for the assertion of arbitrary and unlimited power and control over navigable waters, because, a condition precedent to the Secretary of War's acting, in each instance, is the Chief of Engineer's recommendation. If such power be conceded to him, this one officer of the United States Army can frustrate the efforts of a sovereign state in the interest of public health.

IN THE

SUPREME COURT OF THE UNITED STATES

OCTOBER TERM, A. D. 1924.

THE SANITARY DISTRICT OF CHICAGO, *Appellant*, vs. THE UNITED STATES OF AMERICA, *Appellee.*	Appeal from the District Court of the United States, for the Northern District of Illinois Eastern Division.

PETITION FOR REHEARING ON BEHALF OF APPELLANT.

Now comes The Sanitary District of Chicago, appellant, and respectfully petitions this Honorable Court to vacate the order of affirmance entered herein on the 5th day of January, 1925, and to grant a rehearing in the above entitled cause.

To refresh the Court's recollection of the oral argument, the appellant submits herewith as an appendix to this petition for rehearing, a printed transcript of the oral argument of all counsel.

In support of this petition for rehearing, appellant submits suggestions hereto attached and made a part hereof.

Respectfully submitted,

THE SANITARY DISTRICT OF CHICAGO,

By HECTOR A. BROUILLET,
CLYDE L. DAY,
GEORGE F. BARRETT,
LOUIS J. BEHAN,
EDMUND D. ADCOCK,

SUGGESTIONS IN SUPPORT OF FOREGOING PETITION FOR REHEARING.

(1) The Court's construction of the treaty of January 11, 1909, between the United States and Great Britain, concerning Canadian boundary waters, is erroneous.

The opinion of the Court as to this treaty is as follows (Printed Opinion, p. 3):

> "It (the United States) has a standing in this suit not only to remove obstructions to interstate and foreign commerce * * * but *also to carry out treaty obligations to a foreign power* bordering upon some of the lakes concerned * * * With regard to the second ground, the treaty of January 11, 1909, with Great Britain, expressly provides against uses *'affecting the natural level or flow of boundary waters'* without the authority of the United States or *the Dominion of Canada within their respective jurisdictions and the approval of the International Joint Commission agreed upon therein* * * * a withdrawal of water on the scale directed by the Statute of Illinois * * * cannot be done without the consent of the United States, *even were there no international covenant in the case.*"

The clause of the treaty quoted by the court above, is contained in Article 3 of the Treaty, which relates only to uses, obstructions or diversions of boundary waters as shown by the following, which includes the language quoted by the Court (Treaty, Article 3, Appellant's Narrative 532):

> "It is agreed that, in addition to the uses, obstructions, and diversions heretofore permitted or hereafter provided for by special agreement between the Parties hereto, no further or other uses or ob-

structions or diversions, whether temporary or permanent, OF BOUNDARY WATERS *on* either side of the *line, affecting the natural level or flow of boundary waters* on the other side of the line, shall be made except by authority of the United States or the Dominion of Canada within their respective jurisdiction and with the approval, as hereinafter provided, of a Joint Commission, to be known as the International Joint Commission."

Boundary waters are defined to be waters from main shore to main shore of the lakes and rivers or the portions thereof along which the international boundary passes, as shown by the preliminary article of the Treaty. (Appellant's Narrative 530.)

"For the purposes of this Treaty boundary waters are defined as the waters *from main shore to main shore of the lakes and rivers and connecting waterways, or the portions thereof, along which the international boundary between the United States and the Dominion of Canada passes,* including all bays, arms, and inlets thereof, but not including tributary waters which in their natural channels would flow into such lakes, rivers and waterways, or waters flowing from such lakes, rivers and waterways, or the waters of rivers flowing across the boundary."

The International boundary does not pass along or through Lake Michigan, it is not a boundary water, and it is excluded by the treaty from all regulations covering boundary waters.

That the provisions of the treaty as to boundary waters do not apply, is further demonstrated by Article 1 of the Treaty. The first paragraph of Article 1 provides that navigation of

"all navigable boundary waters"

shall forever continue free and open for the purposes of commerce to the inhabitants and citizens of each country. But in order to give this right of navigation in the

waters of Lake Michigan, the second paragraph of the Article 1 expressly provides

> "that so long as this treaty shall remain in force this same right of navigation shall extend to the waters of Lake Michigan * * *."

In other words, Lake Michigan is not of the class of boundary waters. (Appellant's Narrative 531.)

The powers of the International Joint Commission are fixed and determined by the following language of Article 8 of the Treaty (Appellant's Narrative 535):

> "The International Joint Commission shall have jurisdiction over and shall pass upon all cases involving the use or obstruction or diversion of the waters with respect to which under articles 3 and 4 of this treaty the approval of this commission is required."

Article 4 has no bearing upon the matters in issue and relates principally to the construction of remedial works in boundary waters.

Lake Michigan is not within the provisions of Articles 3 or 4, is not under the jurisdiction of the International Joint Commission and there are no "treaty obligations to a foreign power" (Printed Opinion, p. 3) as to diversions from Lake Michigan to be carried out by the United States.

The United States reserved complete and exclusive control over all diversions from Lake Michigan by Article 2 of this Treaty (Appellant's Narrative, p. 531):

> "Each of the High Contracting Parties reserves to itself, or to the several State Governments on the one side and the Dominion or Provincial Governments on the other, as the case may be, subject to any Treaty provisions now existing with respect thereto, the exclusive jurisdiction and control over the use and diversion, whether temporary or permanent, of all waters on its own side of the line

which in their natural channels would flow across the boundary or into boundary waters; but it is agreed that any interference with or diversion from their natural channel of such waters on either side of the boundary resulting in any injury on the other side of the boundary, shall give rise to the same rights and entitle the injured parties to the same legal remedies as if such injury took place in the country where such diversion or interference occurs; *but this provision shall not apply to cases already existing or to cases expressly covered by special agreement between the parties hereto.*

It is understood, however, that neither of the High Contracting Parties intends by the foregoing provision to surrender any rights which it may have to object to any interference with or diversions of waters on the other side of the boundary the effect of which would be productive of material injury to the navigation interests on its own side of the boundary."

Full jurisdiction of the United States over diversions from Lake Michigan was reserved by Article 2, subject only to the two conditions mentioned, viz.:

(1) The right of injured parties of Canada to sue; and

(2) The right of Canada to object on account of material injury to its navigation interests.

With neither one of those conditions can this Court be concerned. In any event, the conditions do not apply, because, (*first*) the Chicago diversion to the full amount was then existing; and (*second*), the Chicago diversion to the amount of 10,000 cubic seconds feet was settled and agreed upon between the two countries at the time the treaty was made; and Canada could not object as the Treaty was designed to settle all questions then (Appellant's Narrative 530):

> *"pending between the United States and the Dominion of Canada involving the rights, obligations or interests of either in relation to the other or to the inhabitants of the other along their common frontier,"*

The only pending, unsettled and disputed question was the one involving the right of appellant to divert 4,000 cubic seconds feet through and by way of the Calumet River and the Calumet Sag Channel, in addition to the 10,000 cubic seconds feet then diverted through and by way of the Chicago River, for the International Waterways Commission established under joint legislation of Canada and the United States, had settled the right of Illinois and appellant to divert up to 10,000 cubic seconds feet through the Chicago River, and the Commission found that there was no dispute as to this amount. This is shown particularly by the report of the International Waterways Commission of January 4, 1907, on the Chicago Drainage Canal. (Appellant's Narrative 505, *et seq.*)

In speaking of the diversion through the Chicago River, the Commission by said report, stated that (Appellant's Narrative 522):

> "It has satisfied itself upon that point nor does it wish to re-open the case of the Chicago Drainage Canal as designed and built. It accepts that as a fixed fact, with its attendant diversion of 10,000 cubic feet per second through the Chicago River. *The extension of the system to the Calumet River alone is in question,* * * *."

This report was signed by all of the Canadian and American members of the International Waterways Commission.

The plain terms of the treaty preclude any construction that Lake Michigan is under the jurisdiction of the International Joint Commission or that the United States

is obligated to any foreign power as to diversion of water from Lake Michigan. However, reference to the reports of the International Waterways Commission whose duties required them to study and make recommendations concerning all questions between Canada and the United States as to the terms and basis of a treaty then in contemplation and the negotiations leading up to the making of the treaty, and its ratification by the United States Senate, leave no doubt as to our position. When the question of ratification was before the Foreign Relations Committee of the United States Senate, Chandler Anderson of the State Department, at the request of said committee, gave it a memorandum explaining the provisions of the treaty. Among other things, this memorandum stated (Proceedings of Foreign Relations Committee, 57-62d Congresses):

"It is important to have in mind certain general features of the treaty which may be briefly stated as follows:

(1) The distinction which is drawn in the preliminary article between the boundary waters and waters which are tributary to boundary waters and waters of rivers flowing across the boundary is carefully observed in Articles II and III of the treaty.

(2) Article II applies only to waters which in their natural channels would flow across the boundary or into boundary waters, that is before they have passed the boundary or become part of boundary waters; and it cannot by any construction of its provisions apply to the use or obstruction or diversion of boundary waters.

(3) Article III by its express provisions applies only to uses, obstructions or diversions of boundary waters, and cannot by any construction of its provisions have any application to the use, obstruction or diversion of tributary waters or waters of rivers flowing across the boundary.

(4) Article IV, exclusive of the paragraph thereof relating to the pollution of waters, applies only to waters flowing from boundary waters or to the waters of rivers flowing across the boundary *after they have passed the boundary* and can have no application to waters tributary to boundary waters or to waters of rivers flowing across the boundary before they have passed the boundary.

(5) The jurisdiction of the International Commission is strictly limited by Article III to cases arising under Articles III and IV; and it will be observed that under Article IV the Commission is given no jurisdiction over cases arising under the pollution clause of that Article; it is evident, therefore, that the International Commission can have no jurisdiction over cases arising under Article II.

* * *

The waters of Lake Michigan do not come within the definition of boundary waters, as defined in the preliminary article of the treaty, and it will be noted that in Article 1 of the treaty the waters of this lake are not included among the boundary waters of the Great Lakes system but are covered by special provision in the second paragraph of that article.

The question has arisen as to the effect upon Lake Michigan of the provisions of Article II which deals with tributary waters or rather with all waters which in their natural channels flow across the boundary or into boundary waters, and the objection is made that if the provisions of this Article apply to Lake Michigan, the right to recover damages for injuries resulting on the other side of the line on account of the diversion of tributary waters might interfere with the diversion of the waters of Lake Michigan for the purposes of the Chicago Canal.

In response to this objection, *attention is called to the express provision in this Article that it shall not apply to cases already existing which would seem to cover, and was certainly intended to cover, the Canal system at Chicago.*

But in any case, an examination of the provisions of the article will show that, as pointed out in paragraph numbered (6) above, the right of action for

damages applies to private or individual interests in distinction from public or governmental interests, and such interests are given only the same rights which similar interests on the American side of the line would have in the absence of this treaty.

In effect, this provision brings the Canadian interests within the jurisdiction of the United States for this purpose.

The treaty, therefore, recognizes that the settlement of the question of the use of waters of Lake Michigan is purely a domestic question and leaves undisputed the governmental rights of the United States with respect to it.

But this is the view of Great Britain and Canada as shown by the last paragraph of the article which reserves to each of the High Contracting Parties any right which it may now have to object to any interference with or diversion of waters on the other side of the boundary, the effect of which would be productive of material injury to the navigation interests on its own side of the boundary. This provision relates to public interests in distinction from private interests, and would be wholly unnecessary if under the preceding provisions of the article any right was given to recover damages for injuries to public interests on the other side of the line."

Hon. Elihu Root, Secretary of State, was before the Foreign Relations Committee of the Senate at the time that it was considering the ratification and at the time the memorandum of the said Chandler Anderson was before the Committee, and in explaining the terms of the treaty, said (Proceedings of Foreign Relations Committee, 57-62d Congresses, pp. 271-2):

"The great bulk of the water goes on the Canadian side and the Waterways Commission that was appointed some time ago to deal with the question of the lake levels reports, I think, that 36,000 feet can be taken out on the Canadian side and 18,500 feet on the American side without injury to the Falls. I thought it wise to follow the report of the Commission and put in 1,500 feet in addition to get round

numbers, so our limit is higher than we want but their limit would not be cut down below what it is because there are three companies on the Canadian side who have works there. Then there is this further fact why we could not object to this 36,000 cubic feet on the Candian side: We are now taking 10,000 cubic feet per second out of Lake Michigan at Chicago, and I refused to permit them to say anything in the treaty about it. I would not permit them to say anything about Lake Michigan. I would not have anything in the treaty about it, and under the circumstances, I thought it better not to kick about this 36,000. They consented to leave out of this treaty any reference to the Drainage Canal and we are now taking 10,000 cubic feet per second for the Drainage Canal, which really comes out of this lake system."

(International Waterways Commission Report, Canadian Section, April 25, 1906, Appellant's Narrative 103; Report of Entire Commission, May 3, 1906, Appellant's Narrative 104.) Article 5, which fixes the amount of the diversions of the two countries at Niagara Falls, as do the other articles of the treaty contain substantially the recommendations of the International Waterways Commission.

Appellee agrees with us as to the rights of the United States over Lake Michigan under this Treaty (Its Brief, p. 234):

> "*Article 2 expressly reserves to the United States exclusive control over diversions from Lake Michigan* so long as there is no material injury to Canadian navigation interests."

Obviously, the words, "so long as there is no material injury to Canadian navigation interests", do not state the legal effect of the second paragraph of Article 2 of the Treaty to which they are intended to refer, because that merely gives the right to Canada to object and objection could only be made through diplomatic channels

(not important here). Canada is precluded from making objection as the Chicago diversion to the amount of 10,000 seconds feet was settled and agreed upon prior to the making of the Treaty.

(2) The permits of May 8, 1899 and of July 11, 1900, and others of similar import, are not revocable at the will of the Secretary of War, or for any reason except those reserved by the permits themselves. There is no provision of statute by which the Secretary of War may revoke.

In fact, there is no provision of statute by which the Secretary of War may revoke permits for causes reserved in the permit, but we assume that the general power to grant contains impliedly the right to make reservations in the permit entitling him to modify it, if permittee does not comply with the conditions. Section 18 of the Rivers and Harbors Act of March 3, 1899, is the only section empowering the Secretary of War to cause the modification of an obstruction once approved by him and that covers a bridge which had previously been approved, when such bridge has become unreasonably obstructive to navigation, and then only after hearing with the right of the owner of the bridge to be heard. Appellant had acted upon these permits and had expended large sums of money in reliance upon them. Appellee has never made the contention and the point was never argued which is stated by the Court's opinion in this case (Printed Opinion 6) as follows:

> "After this statute was passed, the Secretary of War granted various permits which are relied upon by the appellant, *although in their nature they all were revocable licenses*".

The Secretary of War cannot revoke at will for the very good reason that he has not been delegated that authority. This position does not go to the extent of saying,

however, that Congress might not by itself by some act revoke the permits or direct the Secretary of War to do so. This construction of the power of the Secretary of War to revoke a permit acted upon, was placed upon the similar act of September 19, 1890, by Attorney General Richard Olney, in an opinion to the Secretary of War rendered June 25, 1894; (21 Opinions of Attorneys General, 41, 45).

> "The remaining, question, whether the permit granted February 13, 1894, can, under the existing circumstances of this case, be revoked, is more easily answered. It does not involve the issue whether the power to rescind a permit is a necessarily implied element of the power to grant it, or whether, all the circumstances remaining the same, the Secretary of War, after granting a permit, might cancel it because of a change of mind as to the wisdom or propriety of his original action. Upon the facts appearing in the papers submitted the circumstances are not unchanged, but on the faith of the permit the Altamonte Water Company has gone forward and made contracts, spent large sums of money, and otherwise materially altered its situation. *Under such circumstances,* I am of the opinion that the Secretary of War *is not now at liberty to revoke the permit.*"

Many times this Court has held that the Secretary of the Interior could not erase from the approved rolls the names of citizens of Indian tribes or revoke the approval of an allotment of land, because there was no such power granted by statute.

Garfield v. *U. S., ex rel., John E. Goldsby,* 211 U. S. 249.

Same case, 30 App. Cases, Dist. of Col. 177;

nor could the Secretary of the Interior revoke without express statutory authority approval of an easement for a railroad over public lands.

Noble v. *Union River Logging & R. R. Co.,* 147 U. S. 162.

See, also,

U. S. v. *Schurz*, 102 U. S. 378.
Moore v. *Robbins*, 86 U. S. 530.
Mosgrove v. *Harper*, 33 Ore. Repts., 252.

That permits granted by the Secretary of War are not in their nature revocable at the will of the Secretary, is shown by the provision for the granting of permits by the Secretary of War for the diversion of waters at Niagara Falls, as contained in Section 2 of the Act for the Preservation of Niagara Falls, known as the Burton Act, June 29, 1906. (34 U. S. Stat. at Large, 626.) In the first part of said Section 2 of said Act, the Secretary of War was authorized "to grant permits for the diversion of water in the United States from said Niagara River or its tributaries for the creation of power to individuals, companies or corporations," etc. There is no provision for revocation and the power is general, similar to the power granted under Section 10 of the Rivers and Harbors Act of March 3, 1899. Under a later provision of said Section 2 the Secretary is authorized "to grant revocable permits from time to time" to another class of persons, indicating that Congress construed general authority to grant permits not specifically designated to be revocable as not implying authority to revoke at will.

The court may have assumed that the permits of the Secretary of War granted under the Rivers and Harbors Act of March 3, 1899, or the similar section of the Rivers and Harbors Act of September 19, 1890, had been construed to be revocable at will or in their nature revocable, by this court in *United States* v. *Chandler-Dunbar Water Power Company*, 229 U. S., 51, 57 Law Edition, 1063, 1077. However, an examination of the record in that case, discloses that the permits of January

12th and April 2, 1888, August 13, 1892, July 6, 1893, March 14, 1899, June 9, 1902, December 12, 1902, March 10, 1903, May 8, 1905, June 15, 1906, April 14, 1909 issued in the Chandler-Dunbar Water Power Company case, which were expressly revoked by the act of Congress of 1909, were by express terms revocable at will. In other words, the Secretary of War by the permit itself reserved the right to revoke for any cause.

The condition as to revocation in said permits in the *Chandler-Dunbar case,* is as follows:

> "That at any time, whenever in the opinion of the Secretary of War it may for any reason be expedient that this license should be revoked, the Secretary of War shall and may cause notice to that effect to be given. * * *"

It is significant that during the period that the Secretary of War was issuing permits to the appellant in which he reserved the right only to modify or revoke for certain reasons stated in the permit, he was at the same time issuing permits to another corporation by which he reserved the right to revoke at will or for any cause. He recognized that he might issue two kinds of permits, one revocable at will, the other not revocable, or only revocable or to be modified for a cause stated in the permit, and permits of the latter character he chose to issue to appellant.

(3) The Court has erroneously construed the language and effect of the permits of May 8, 1899, July 11, 1900, July 23, 1901, December 5, 1901 and September 11, 1907, and the statement of January 8, 1913, of Secretary Stimson, mentioned on pages 6 and 7 of the Court's opinion.

The opinion of the Court states (Printed Opinion, p. 6):

> "On May 8, 1899, the Secretary, on application of the appellant, granted permission to open the channel, assumed in the recitals *to have a flowage capacity of* 300,000 *cubic feet per minute* with a velocity of one and one-quarter miles an hour, on the conditions that the permit should be subject to the action of Congress (which was superfluous except as a warning); that if at any time the current created proved to be *unreasonably obstructive to navigation or injurious to property he reserved the right to close or modify the discharge;* * * *."

The statement in the foregoing quotation does not correctly interpret the recital of said permit as to the 300,000 cubic feet per minute. The court has also erroneously stated the effect of condition 2 of the May 8, 1899, permit, in that the right to revoke is limited to unreasonable obstructions to navigation or injury to property by current *in the Chicago River*, instead of to navigation or property wherever located, as the opinion of the court seems to indicate.

The recital states merely that appellant

> "has been heretofore granted permission by the Secretary of War to make certain improvements in the Chicago River for the purpose of correcting and regulating the cross section of the river so as to secure a flowage capacity of 300,000 cubic feet per minute, with a velocity of 1¼ miles per hour," (Appellant's Narrative, p. 481.)

That recital does not state the capacity of appellant's Sanitary and Ship Canal to be only 300,000 cubic feet per minute. It merely mentions the improvement of the Chicago river channels under Secretary of War permits. The capacity of that channel was fixed by state law, and it was so constructed to have a capacity of 10,000 cubic seconds feet. The only reference to the channel is in that

portion of the preamble preceding that just above quoted—

> "whereas the Sanitary District of Chicago, a municipal corporation organized under the laws of the State of Illinois, has constructed an artificial channel from Robey Street, Chicago, to Lockport,"

The capacity of the channel as fixed by state law, as planned and as actually constructed, was within the knowledge of the Chief of Engineers and the Secretary of War at the time the permit was granted, as expressly advised by War Department Engineers in the discharge of their duties.

If the Court by reference to said 300,000 cubic feet per minute as stated in the preamble to said permit, intends thereby to treat said permit as only authorizing a diversion of that amount, subject to the express conditions of the permit, or if the Court for any other reason has construed the said permit of May 8, 1899, as not authorizing a diversion in excess of 300,000 cubic feet per minute, subject to the conditions of said permit, then a reference to certain pertinent facts surrounding the issuance of said permit will clearly demonstrate this misapprehension.

Beginning with the passage of appellant's act of May 29, 1889, the Chief of Engineers and the Secretary of War were given copies of the act, which act fixed the capacity of appellant's main channel at not less than 10,000 cubic seconds feet of water, the plans of appellant's main channel made under the requirements of said act, and information as to progress of construction of the channel. These facts came to them from the Division Engineer at Chicago. (Appellant's Narrative, pp. 451-454-455.)

August 16, 1895, the Chief of Engineers and Secretary of War received a report from a Special Engineer Com-

mission, consisting of Col. Poe, Major Rufiner and Major Marshall. (Appellant's Narrative, p. 465.) This Board of Engineers was to report upon

> "the probable effect of the operation of the Chicago Drainage Canal upon the lake and harbor levels and upon the navigation of the Great Lakes and their connecting waterways."

In that report they state the capacity of appellant's Main Channel to be 600,000 cubic feet per minute, as follows: (Appellant's Narrative, p. 467.)

> *"Throughout the rock sections and those sections in which there is a preponderance of hard material or where rock may appear, the section adopted is designed according to law for a flow of 600,000 cubic feet of water per minute, which means provision for a population of three million people."*

Major Marshall, United States Engineer at Chicago, under the direction of the Rivers & Harbors Act of June 3, 1896, made a report to the Chief of Engineers which was submitted to Congress by the Secretary of War (H. R. Document 353, 54th Congress, 2d Session) and in connection with the capacity of Appellant's main channel, stated (Appellant's Narrative 487):

> "To comply with the law of the State of Illinois under which this drainage canal is constructed—it has been constructed of a capacity to discharge 600,000 cubic feet per minute through the section excavated in rock and 300,000 cubic feet per minute throughout the earth section—the law requires a discharge of 20,000 cubic feet per minute for each 100,000 inhabitants of the drainage district, which at present requires more than 300,000 cubic feet and in a few years will require the full 600,000 cubic feet discharge through the canal."

The report of Major Marshall, dated April 24, 1899, to the Chief of Engineers, in regard to the application of Appellant to open its canal, which was granted by the

permit of May 8, 1899, in referring to the capacity and amount of withdrawal, stated (Appellant's Narrative 479):

> "20,000 cubic feet per minute must be taken from Lake Michigan for each 100,000 population of the District; already nearly 400,000 cubic feet must be taken, * * *."

The capacity of the artificial channel mentioned in the permit of May 8, 1899, as having been then constructed—being 600,000 cubic feet per minute, or 10,000 cubic feet per second—authorized to be opened, was clearly made known to the Chief of Engineers and the Secretary of War through United States engineer officers in the performance of their duty.

There are other attendant facts that are important. April 21, 1891, as soon as Appellant's main channel was surveyed and its capacity determined upon, the Board of Trustees of Appellant adopted a project for the improvement of the Chicago River to make the artificial channel under construction available (Appellant's Narrative 454)—

> "Resolution of April 21, 1891, of the Board of Trustees of the Sanitary District of Chicago.
>
> * * *
>
> Resolved, That this Board hereby ordains that The Sanitary District of Chicago do forthwith enter upon, use, widen, deepen and improve the Chicago River from its mouth at Lake Michigan to the South Branch thereof, and also the South Branch thereof, together with the South and West Forks thereof so as to make the same a proper and sufficient supply channel for the main channel heretofore surveyed from the Chicago River to Joliet; and further, that the Acting Chief Engineer be, and he is hereby, directed immediately to investigate and report upon the capacity of said River and its said South Branch and Forks for that purpose, and also as to any changes that should be made therein, and that a copy of this resolution,

certified by the clerk, be forthwith transmitted to the Mayor and Common Council of the City of Chicago, and the Secretary of War of the United States."

The Chicago River, its South Branch and West Fork thereof, was then narrow, shallow and tortuous. To permit taking through the river channels the amount of water represented by the capacity of Appellant's main channel required their enlargement. To permit the taking through the channels of those rivers the water *immediately* necessary at the time of the opening of the main channel, comparatively small improvement was necessary. The excavation and work under the permits of June 3, 1896, October 28, 1897, November 30, 1898, March 10, 1899, May 12, 1899 and June 13, 1899, corrected the river channels for this latter purpose (Appellant's Narrative 473 to 478). This was the improvement referred to in the preamble of the May 8, 1899, permit. The application for the first permit for the temporary improvement of these river channels is significant (Appellant's Narrative 88)—

"The work of The Sanitary District of Chicago has progressed so far that it is now necessary for us to enter upon that which must be done in the Chicago River to make available the artificial channel which we have under construction from Robey Street, Chicago, to Lockport in Will County, Twenty-eight miles distant.

Our connection with Lake Michigan must be through the Chicago river with the West Fork of the South Branch of which we make a junction at Robey Street. We send herewith a map showing in a general way our plans for improving the Chicago River by widening and deepening at the points indicated thereon by red hatchings and by figures which refer to explanation, given in the legend on the map. It is desired to so correct and regularize the cross section of the river as to secure a flowage capacity of 300,000 cubic feet per minute with a velocity of one and one-quarter miles per hour."

July 3, 1896, permit was granted as to this first improvement of the Chicago River to make the cross section so as to secure a flowage of 300,000 cubic feet per minute and contained the condition that a current should not be introduced in the Chicago River. The other permits for similar improvements contained like conditions.

Therefore, after this work was done, the flowage capacity of the Chicago River channels had been so corrected that 300,000 cubic feet per minute could be taken through without creating an objectionable current, and Appellant was thus authorized by these various permits to take that amount of water through. The main channel, however, was constructed with the capacity to take twice that much water—which larger amount of water would be required in a few years—and appellant desired approval of the entire plan by the Secretary of War. It, therefore, made the application for the May 8, 1899, permit, which permit was granted to:

> "open the channel constructed and cause the waters of Chicago River to flow into the same, subject to the following conditions: * * *
>
> 2. That if, at any time, it become apparent that the *current* created by such drainage works in the south and main branches of the Chicago river, be unreasonably obstructive to navigation or injurious to property, the Secretary of War reserves the right to close said discharge through said channel or to modify it to such extent as may be demanded by navigation and property interests along said Chicago river and its South Branch. * * * (Appellant's Narrative 482.)

According to said permit the only condition of taking from Lake Michigan the amount of water which represented the maximum capacity of Appellant's channel—10,000 cubic second feet—was the reservation that the Secretary of War might determine the manner in which

the water should be taken through the Chicago River, such manner and such determination to be based upon the enlargement of the river so that a *current* in said river should not exist unreasonably obstructive to navigation. And the immediate provision for the very material enlargement of the Chicago River Channels to take through them an amount of water equal to the capacity of appellant's Main Channel and consented to by the July 11, 1900, permits about now to be mentioned, leaves no question as to the intention of the Secretary of War under condition 2 of said May 8, 1899, permit.

The permit approved all modifications of the navigable capacity of the Great Lakes and reserved merely the right of the Secretary of War to approve the manner of taking the full amount of water required for Appellant's canal through the Chicago River channels.

On July 11, 1900, two permits were issued pursuant to the application of The Sanitary District, authorizing the enlargement of the Chicago River, its South Fork and West Fork, by deepening it from seventeen to twenty-six feet and widening it at all points to two hundred feet. This improvement cost almost $11,000,000 and no objection has ever been made by appellee to the current in the River created after the improvement was completed with the diversion of 10,000 cubic seconds feet. The permits themselves refer to the May 8, 1899, permit and the conditions thereof. The application for the permits and the permits were granted under the reserved condition 2 of the permit of May 8, 1899,—the Secretary of War should determine the manner in which the full amount of water should be taken through the Chicago River channels, so that a current would not be created unreasonably obstructive to navigation. This Court, however, in its opinion, with reference to said permits, stated (Printed Opinion, p. 6):

"On July 11, 1900, improvements of the Chicago River were permitted with the statement that the permission did not affect the right of the Secretary to revoke the permit of May 8, 1899."

The above language carries the inference that the Court assumed that the condition of the July 11, 1900, permits allowed the Secretary of War to revoke the permit of May 8, 1899, at will, and that modification of the May 8, 1899, permit was not confined to the causes or conditions expressly reserved in said permit. The July 11, 1900, permits reiterate the conditions of the May 8, 1899, permit. That the Court's construction of the July 11, 1900, permits is erroneous, is shown by a mere reading of it. We quote from the first one as they are alike, (Appellant's Narrative 92):

"Sir: I have the honor to acknowledge the receipt of your letter of April 26th last, requesting, in behalf of the Sanitary District of Chicago, permission to change, alter and improve the Chicago River, from Lake Street to Ashland Avenue, in Chicago, as shown on maps which accompanied your said letter.

Replying thereto I beg to inform you that there is no objection on the part of the War Department to the prosecution of work of improvement of Chicago River, specified in the above mentioned letter and delineated on the maps which accompanied the same, it being understood that this statement as to the attitude of the War Department shall not be understood as involving the general government in any way with the expense incident to the carrying out of the project, and does not in any way invalidate, waive or affect the right of the Secretary of War to regulate or revoke the permit granted under date of May 8, 1899, to the Sanitary District of Chicago, to divert the waters of the Chicago River and cause them to flow into the artificial channel, *such permission* being subject to the following conditions, viz.:

* * *"

The balance of the July 11, 1900, permit is a quotation from the May 8, 1899, permit of all the conditions of same—being three in number. The words:

> "such permission being subject to the following conditions"

—refer to the May 8, 1899, permit and modify the words

> "to regulate or revoke the permit granted under date of May 8, 1899"

and confine regulation and revocation to the conditions of the May 8, 1899, permit. These permits show that the Secretary of War then considered that the permit of May 8, 1899, authorized the diversion, subject to the conditions, to the maximum capacity of the main channel, for the work to be done under the July 11, 1900, permits would double the flowage capacity of the Chicago River channels so that the 10,000 seconds feet could be taken through without creating a current injurious to navigation.

The orders of the Secretary of War of July 23, 1901, and December 5, 1901, were made expressly under condition 2 of the May 8, 1899, permit, under which the Secretary of War was to regulate the manner by which the Appellant should withdraw water through the Chicago River channels, and that only. The conditions of those two permits of July 23, 1901, and December 5, 1901, refer to condition 2 of said permit of May 8, 1899, for that condition is quoted in the permit of December 5, 1901. The subject matter of the two permits was the regulation under said condition 2. Condition 2 of December 5, 1901, permit, and the similar condition of the permit of July 23, 1901 (Appellant's Narrative 25):

> "That the permission herein given shall be subject to such modification as in the opinion of the Secretary of War the public interests may from time to time require"

cannot be construed as revoking, or attempting to revoke, the consent given by the Secretary of War as to the modification of the navigable waters of the United States other than the Chicago River. That condition must be confined to condition 2 of the May 8, 1899, permit as to the method of taking through the Chicago River channels the amount of water required by Appellant for the operation of its main channel to its full capacity, for in issuing the said orders or permits of July 23 and December 5, 1901, the Secretary was attempting and assuming only to act under the reservation contained in condition 2 of the May 8, 1899, permit as to regulating the withdrawal through the Chicago River.

Condition 2 of the permit of September 11, 1907, as to the North Shore Channel, which was merely to allow making connection with Lake Michigan at Wilmette, Illinois, and was not to increase the diversion through the Chicago River and merely a part of the Chicago river diversion (Appellant's Narrative 82):

> "That the total diversion of water from Lake Michigan through the Chicago River into the Illinois River shall be no greater than already authorized by past War Department permits"

—referred only to past permits, which were that the Secretary of War had approved the diversion to the capacity of the main channel—10,000 cubic feet per second—and had consented to the modification of all navigable waters of the United States resulting from such diversion subject only to regulating the enlargement of the Chicago River channels to take through them the amount required by appellant.

The permit of June 30, 1910, as to the Calumet Sag Channel was issued for convenience and necessity and was not intended to in any manner affect the rights of

either party, and, as the Court states, was not to be used in the litigation to test rights. No revocation of authority given by the Secretary of War under previous permits was intended nor can Appellant be considered in any respect to have waived rights already granted.

The statement of the Secretary of War of January 8, 1913, was merely the refusal of an application to remove the limitation theretofore made by the Secretary of War under condition 2 of the permit of May 8, 1899, the reason for which limitation had been then removed, as the Chicago River channels had been enlarged to take the amount of water fixed by the capacity of Appellant's main channel—10,000 cubic seconds feet. There was no attempt at that time by the Secretary of War to revoke any permit given, even if he considered he had the power.

(4) The Attorney General did not attempt under the bill of complaint in this proceeding, to exercise any authority other than that alleged to have been given him by Section 12 of the Rivers and Harbors Act of March 3, 1899.

This Court, in its opinion said (Printed Opinion, p. 1):

> "The prohibition of such alterations and obstructions in the Act of March 3, 1899, c. 425, Sec. 10; 30 Stat., 1121, 1151, is set out at length and relied upon but the frame of the bill does not exclude a reliance upon more general principles if they were needed in order to maintain it."

Outside of the general priciple that the pleading of a party shall be taken most strongly against him, there is nothing in the bill of complaint here which indicates that the Attorney General sought to exercise power under any other Act of Congress than the Act of March 3, 1899, or that he attempted to act under general authority. On the contrary, it was admitted by counsel for appellee on

oral argument in reply to questions put by Mr. Justice McReynolds, that the basis of the bill of complaint was the Act of March 3, 1899. (See pages 132 and 133, Printed Transcript of Oral Argument appendix hereto.)

The March 3, 1899, Act does not authorize the Attorney General to institute suits to enjoin the creation or continuance of an obstruction. It merely authorizes him by injunction to remove a structure.

Respectfully submitted,

HECTOR A. BROUILLET,
CLYDE L. DAY,
GEORGE F. BARRETT,
LOUIS J. BEHAN,
EDMUND D. ADCOCK,

I hereby certify that this petition for rehearing in this case is filed in good faith, the contents thereof and the suggestions attached are believed to be true, and the same is not interposed for delay.

Respectfully submitted,

EDMUND D. ADCOCK,
Of Counsel for Appellant.

QUESTIONS BY THE COURT.

Preliminary Questions:

CHIEF JUSTICE TAFT: Question 1 (p. 2), 2 (p. 2), 3 (p. 3).

MR. JUSTICE MCREYNOLDS: Question 1 (p. 3), 2 (p. 3), 3 (p. 3), 4 (p. 4), 5 (p. 4), 6 (p. 4), 7 (p. 4), 8 (p. 4), 9 (p. 5).

Questions Asked of Appellant's Counsel:

CHIEF JUSTICE TAFT: Question 1 (p. 15), 2 (p. 15), 3 (p. 23), 4 (p. 25), 5 (p. 25), 6 (p. 25), 7 (p. 25), 8 (p. 27), 9 (p. 32), 10 (p. 32), 11 (p. 32), 12 (p. 32), 13 (p. 32), 14 (p. 33), 15 (p. 41), 16 (p. 41), 17 (p. 41), 18 (p. 41), 19 (p. 45), 20 (p. 45), 21 (p. 58), 22 (p. 58), 23 (p. 58), 24 (p. 61), 25 (p. 61), 26 (p. 136), 27 (p. 136), 28 (p. 140), 29 (p. 140).

Mr. Justice Brandeis: Question 1 (p. 18), 2 (p. 22), 3 (p. 23), 4 (p. 24), 5 (p. 24), 6 (p. 24), 7 (p. 24), 8 (p. 24), 9 (p. 25), 10 (p. 27), 11 (p. 29), 12 (p. 31), 13 (p. 31), 14 (p. 42), 15 (p. 42), 16 (p. 43), 17 (p. 43), 18 (p. 60), 19 (p. 60), 20 (p. 60), 21 (p. 60), 22 (p. 60), 23 (p. 60), 24 (p. 60), 25 (p. 60).

Mr. Justice Butler: Question 1 (p. 30), 2 (p. 30), 3 (p. 31), 4 (p. 31), 5 (p. 59), 6 (p. 59), 7 (p. 59), 8 (p. 59).

Mr. Justice Holmes: Question 1 (p. 7), 2 (p. 8), 3 (p. 21), 4 (p. 42), 5 (p. 42), 6 (p. 51), 7 (p. 56), 8 (p. 137).

Mr. Justice McKenna: Question 1 (p. 10), 2 (p. 21).

Mr. Justice McReynolds: Question 1 (p.10), 2 (p. 10), 3 (p. 10), 4 (p. 10), 5 (p. 11), 6 (p. 15), 7 (p. 15), 8 (p. 15), 9 (p. 15), 10 (p. 16), 11 (p. 16), 12 (p. 17), 13 (p. 17), 14 (p. 20), 15 (p. 20), 16 (p. 20), 17 (p. 20), 18 (p. 21), 19 (p. 21), 20 (p. 21), 21 (p. 21), 22 (p. 23), 23 (p. 26), 24 (p. 26), 25 (p. 26), 26 (p. 26), 27 (p. 27), 28 (p. 39), 29 (p. 40), 30 (p. 55), 31 (p. 55), 32 (p. 56), 33 (p. 56), 34 (p. 136).

Mr. Justice Sanford: Question 1 (p. 15), 2 (p. 43), 3 (p. 44).

Mr. Justice Sutherland: Question 1 (p. 8), 2 (p. 22), 3 (p. 34), 4 (p. 34), 5 (p. 34), 6 (p. 40), 7 (p. 40), 8 (p. 40), 9 (p. 41), 10 (p. 41), 11 (p. 41), 12 (p. 46), 13 (p. 55), 14 (p. 137).

Mr. Justice Van Devanter: Question 1 (p. 7), 2 (p. 10), 3 (p. 10), 4 (p. 11), 5 (p. 11), 6 (p. 11), 7 (p. 11), 8 (p. 11), 9 (p. 12), 10 (p. 13), 11 (p. 13), 12 (p. 13), 13 (p. 13), 14 (p. 13), 15 (p. 13), 16 (p. 14), 17 (p. 14), 18 (p. 17), 19 (p. 27), 20 (p. 27),

21 (p. 27), 22 (p. 28), 23 (p. 28), 24 (p. 29), 25 (p. 29), 26 (p. 29), 27 (p. 31), 28 (p. 34), 29 (p. 34), 30 (p. 35), 31 (p. 35), 32 (p. 35), 33 (p. 35), 34 (p. 35), 35 (p. 36), 36 (p. 36), 37 (p. 138), 38 (p. 138).

Questions Asked of Amicus Curiae in Favor of Appellant:

CHIEF JUSTICE TAFT: Question 1 (p. 68), 2 (p. 68), 3 (p. 73), 4 (p. 73), 5 (p. 73), 6 (p. 73), 7 (p. 73), 8 (p. 74), 9 (p. 74), 10 (p. 74), 11 (p. 75).

MR. JUSTICE BRANDEIS: Question 1 (p. 71), 2 (p. 71), 3 (p. 71), 4 (p. 72), 5 (p. 73).

MR. JUSTICE HOLMES: Question 1 (p. 76).

MR. JUSTICE MCKENNA: Question 1 (p. 70).

MR. JUSTICE SANFORD: Question 1 (p. 71), 2 (p. 71), 3 (p. 74), 4 (p. 75), 5 (p. 75), 6 (p. 79), 7 (p. 79).

MR. JUSTICE SUTHERLAND: Question 1 (p. 66).

Questions Asked of Appellee's Counsel:

IN THE

SUPREME COURT OF THE UNITED STATES

OCTOBER TERM, A. D. 1924.

THE SANITARY DISTRICT OF CHICAGO, *Appellant*, vs. THE UNITED STATES OF AMERICA, *Appellee*.	Appeal from the District Court of the United States, for the Northern District of Illinois, Eastern Division.

TRANSCRIPT OF ORAL ARGUMENT.

Washington, D. C.,
Monday, Dec. 8, 1924.

The above-entitled cause came on, for oral argument, before the full court, at 1:40 o'clock P. M.

Appearances:

For the appellant:

Edmund D. Adcock, Esq.; George F. Barrett, Esq.; Louis J. Behan, Esq.; and Clyde L. Day, Esq.

For the appellee:

Hon. James M. Beck, Solicitor General of the United States.

Joseph B. Fleming, Esq., Special Assistant to the Attorney General.

Amicus curiae, in favor of appellant:

Daniel N. Kirby, Esq.

Amici curiae, in favor of appellee:

Hon. Andrew B. Dougherty, Attorney General of Michigan;

Harvey D. Goulder, Esq., for Lake Carriers' Association;

Hon. Herman L. Ekern, Attorney General of Wisconsin;

Hon. U. S. Lesh, Attorney General of Indiana;

Hon. C. S. Ferris, Deputy Attorney General of New York.

The Chief Justice: This is the case in which I have had some conversation with counsel with reference to the time to be taken?

Mr. Beck: Yes, sir. In this case, if the Court please, which is one of exceptional magnitude, in addition to the counsel for the Government and the counsel for the Sanitary District of Chicago, there appear as *amici curiae*, on behalf of appellant, the attorneys-general of the States of Illinois, Missouri, Louisiana and Tennessee, and on behalf of the United States there appear as *amici curiae*, the attorneys-general of Indiana, Michigan, Minnesota, New York, Ohio, Pennsylvania and Wisconsin.

The Chief Justice referred to the informal negotiations, or, at least, to a discussion with respect to the—

The Chief Justice: Well, you might say "negotiations." (Laughter.)

Mr. Beck: With respect to the time; and as I understand it will be your Honors' pleasure to give the appellant three hours and the counsel for the Government two hours and a half.

The Chief Justice: That will make five and a half hours.

Mr. Beck: That will make five and a half hours, yes.

The Chief Justice: Yes, I think that is fair, on account of the number of counsel engaged and the importance of the case, as well as the number of facts that the record would indicate that require discussion.

But there is one question that I would like to suggest: This case has been long in dispute, or the controversy has been long in dispute. It goes back as far as the time when I was Secretary of War. And I do not remember what happened then; but I remember that a number of counsel came before me with reference to the matter—perhaps it was a permit; I have forgotten just what it was.

Mr. Adcock: It only related, your Honor, to one adjunct of the main channel—one phase of it.

The Chief Justice: Well, I do not know enough about it to know whether it should disqualify me or not. Counsel ought to have advised themselves with respect to that; but if there is the slightest objection, or if there is any doubt about it, of course I will withdraw.

Mr. Adcock: There is no objection, so far as we are concerned. I might state in this connection also that it was when Mr. Justice McReynolds was attorney general that the suits were instituted; but that is no objection to his sitting in the case, so far as we are concerned.

Mr. Justice McReynolds: Did I bring the suit when I was attorney general?

Mr. Adcock: Yes, sir, under Section 12 of the Act of March 3, 1899.

Mr. Justice McReynolds: Well, do you not think that I had better excuse myself?

Mr. Adcock: Not so far as we are concerned.

Mr. Justice McReynolds: Well, how about this record? Is this record just dumped in on us, like it was dumped in on the District Court, without any modification?

Mr. Adcock: I think you will find that there is filed with the appellant's brief, as an appendix, a condensation of the record.

Mr. Justice McReynolds: Well, but has the record been made up in accordance with the rule, or is it sent up as originally taken?

Mr. Adcock: It is sent up as originally taken.

Mr. Justice McReynolds: Well, you know we have talked about that rather severely. How many pages of this record are there?

Mr. Adcock: About 5,000.

Mr. Justice McReynolds: Well, do you expect anybody to read that?

Mr. Adcock: The condensation complies, I think, with the rule, so far as that is concerned—the condensation that we have prepared and printed and furnished, in connection with the galley proofs, etc., that have been given to counsel; that embraces practically everything that is material.

Mr. Justice McReynolds: I know; but why was not the record made to comply with the rule?

Mr. Adcock: Well, at that time we thought that it would probably be impossible to condense the record; and there was an order entered by the lower court, which I think complies with the rules, directing it to be taken up as the record was printed in the lower court.

Mr. Justice McReynolds: I do not think that that record ought to be imposed on us.

Mr. Adcock: I do not believe that there is any imposition on the Court here as the record now stands, with the condensation. I do not believe there are any disputed questions of fact here that are very material.

Mr. Justice McReynolds: Well, is it a question of fact involved in this case, or a question of law?

Mr. Adcock: I do not believe there is any material question of fact, no; practically all the facts that are material are admitted.

Mr. Justice McReynolds: Well, I was wondering what all this record was about, if there was no question of fact?

Mr. Adcock: Well, there was a great deal of testimony taken in regard to the hydraulics of the Great Lakes; there were a great many documents that were put in evidence that were necessary to show what had been done, running over, probably, a century, since the Act of March 2, 1827.

May I proceed?

The Chief Justice: You may.

Mr. Adcock: The Chief Justice was making a statement—

Mr. Beck (Interposing): Before you proceed, let me say that the Government concurs in the suggestion of Mr. Adcock that it will be agreeable to both counsel, if your Honor, the Chief Justice, and your Honor, Mr. Justice McReynolds, should sit in this case.

The Chief Justice: That is understood, then. I do not think that either side is making any great concession (laughter). But those of us that are affected by it, I am sure, appreciate the courtesy.

Mr. Adcock: Well, the only thing the Chief Justice did was to find that, as Secretary of War, he had no right to do anything, as the Chief of Engineers had not recommended anything. (Laughter.) And I think Mr. Justice McReynolds, as Attorney General, merely signed the bill as one of his ordinary duties, and probably never read it.

The Chief Justice: Well, you may proceed, Mr. Adcock.

I suggest this to counsel: If you will give me a list of the assignment, or the allocation of the time—

Mr. Adcock: I was just going to suggest that.

The Chief Justice (Continuing): I will keep the time as against your own colleagues, and of course, as against yourselves and the other side, in the same way.

Mr. Adcock: Well, in addition to the *amici curiae* as mentioned by the Solicitor General, in support of the appellant, there is the City of Chicago; the Association of Commerce of Chicago; some commercial organizations of St. Louis; the Mississippi Valley Association; and similar organizations of Memphis; and similar organizations of New Orleans.

As I understood the suggestions which were made to the Chief Justice in regard to the time, and as indicated when the *amici curiae* were permitted to file briefs, and when they asked permission to participate in the argument, there was to be one counsel representing the *amici curiae* to be heard.

Mr. Daniel N. Kirby, of St. Louis, will use half an hour of our time; and he will be the only counsel representing the *amici curiae* to argue on the appellant's side.

Mr. Beck: May I just say that I did not understand that there was to be only one *amici curiae* to argue; and the arrangement of the appellee was that Mr. Goulder, of Cleveland, should speak for twenty minutes for the Lake Carriers' Association; and Attorney General Dougherty, of Michigan, should speak for the seven Attorneys-General who are freindly to the Government.

The Chief Justice: Well, you can arrange it as you please among yourselves; but I think it will help you if you can give me an assignment of time, so that I can keep a record of it.

Mr. Adcock: Yes, sir.

I have been selected to present the case for appellant; and I know of no reason for that, except that I have been with the case since the beginning of the year 1913, and most of the evidence was presented by me in behalf of the Sanitary District. Otherwise, I would not have the assurance to accept that duty of attempting to present a matter of this kind.

And I expect to be able to present the case—or we intend to on our side to present all of our contentions in our opening statement; and on behalf of the appellant directly and on be-

half of the *amici curiae*, I desire, of the two hours and a half which we have, to present the matter in the opening in two hours, reserving only half an hour for closing. And I will endeavor to make it shorter, if it can be done; but on account of the circumstances that must be called to the attention of the Court, I fear that I will be unable to do that.

The Chief Justice: Very well; you may proceed, Mr. Adcock.

Oral argument of Edmund D. Adcock, Esq., on behalf of appellant, The Sanitary District of Chicago.

Mr. Adcock: This comes here from the District Court at Chicago, and is a direct appeal.

The decree in that court which is questioned here, enjoins the Sanitary District of Chicago, the appellant, which is a municipal corporation organized under the laws of that State, from diverting or abstracting from Lake Michigan any waters in excess of 4,167 cubic seconds feet, or 250,000 cubic minutes feet. Now, when you speak of seconds feet or minutes feet, it means the number of cubic feet of water that will pass a given point in a minute, or in a second.

Mr. Justice Holmes: Just give me that number again: How many second feet?

Mr. Adcock: 4,167 cubic seconds feet of water.

Mr. Justice VanDevanter: That means cubic feet per second?

Mr. Adcock: Cubic feet per second; and we speak of it shortly as "seconds feet"; and that corresponds to 250,000 cubic feet per minute.

The decree of the lower court held that Section 20 and Section 23 of the Sanitary District Act, that is, the act under which appellant was organized, were void and unconstitu-

tional, in that they limited the quantity of water that that act provided should be diverted from Lake Michigan—

Mr. Justice Sutherland (Interposing): That is, an act of the State of Illinois?

Mr. Adcock: That is an act of the State of Illinois. The act was passed on May 29, 1889, a little over a third of a century ago; and construction was commenced almost immediately, and occupied a period of approximately ten years.

Section 20 of that act provides that there shall be caused to flow or drain from Lake Michigan through the channel —that is the sanitary and ship canal, which is the main diversion channel of the appellant, and Des Plaines and Illinois Rivers, not less than 20,000 cubic feet of water per minute for every 100,000 population. The population at the time the decree was entered being approximately 3,000,000 people, the required withdrawal, which was mandatory, was 10,000 cubic seconds feet of water, or 600,000 cubic feet per minute.

The application of the Commerce Clause of the Constitution is involved in the case; and I think the jurisdiction of this Court was decided in the case of *Cummings* v. *Chicago*, in 188 U. S.

There is also, perhaps, involved, the interpretation of the treaty between the United States and Great Britain as to boundary waters. The Government would give a certain construction to that treaty; and we give a certain construction; and there is some dispute about that.

The case involves the construction of section 10 of the Rivers and Harbors Act of March 3, 1899. That will be found at page 108 of our brief; and beginning at page 106, you will find set out in juxtaposition the acts of 1890 and 1899, which were similar; that is, sections 7 and 10 of the 1890 act were similar to sections 9, 10 and 12 of the 1899 act.

Mr. Justice Holmes: Which is the act we are called upon to deal with?

Mr. Adcock: The 1899 act, which appears in the second column.

Mr. Justice Holmes: Yes, I see it.

Mr. Adcock: The case involves, primarily, the whole plan and program that the State of Illinois adopted in 1889, for the protection of the water supply of Chicago and its environs; to provide for that city a pure drinking water; and to keep Lake Michigan, the only water supply, unpolluted.

It also involves—which was one of the features of this act—the program of the State of Illinois as to making provision for a deep waterway from Lake Michigan to the Gulf of Mexico. There were two objects of that act.

The decree in this case, your Honors, if made effective immediately and without condition—the Court suspended the operation of the decree during the appeal here—would absolutely prostrate all the works that have been built by the appellant, at a cost of something like $100,000,000.

It would create a condition, which is admitted, I think, in the record in this case; there is no testimony to the contrary; and I think the Government in its brief so admits—it would create an intolerable condition, which would cause conditions of nuisance in the Chicago River; the Sanitary and Ship Canal, the main channel; and the Des Plaines and Illinois Rivers. If the amount of water were limited as contended for by our opponents, the Chicago River, with its pollution of sewage and drainage at numerous times during the year would go into Lake Michigan, carrying with it that pollution, polluting the water supply; and the result would be the raging of typhoid fever and other water-borne diseases—perhaps causing the condition which existed prior to the construction of the canal, when the rate would run up to 170 deaths per 100,000 inhabitants; whereas now the typhoid death rate is less than 8 per 100,000.

Mr. Justice VanDevanter: The United States brought this suit, did it?

Mr. Adcock: The United States brought the suit.

Mr. Justice VanDevanter: Now, it was decided on what ground? What was the ground of the lower court's decision?

Mr. Adcock: I am coming to that. The United States instituted the suit; and there was a question of jurisdiction in the lower court. That is, the suit was brought at the instance of the Attorney General, under section 12 of this Rivers and Harbors Act of 1899, appearing at page 108 of our brief. There is a question as to whether the Attorney General under that section had the authority to institute the suit; and therefore, there was a question of jurisdiction. The act provides that he may institute a suit for injunction to cause the removal of a structure or part of a structure. This suit is not for that purpose.

Mr. Justice McReynolds: Read the act and let us see what it says.

Mr. Adcock (Reading):

> "And further, the removal of any structures or parts of structures"—

Mr. Justice McKenna: What are you reading from?

Mr. Adcock: Page 109 of my brief.

> "And further, the removal of any structures or parts of structures erected in violation of the provisions of the said sections may be enforced by the injunction of any circuit court exercising jurisdiction in any district in which such structures may exist, and proper proceedings to this end may be instituted under the direction of the Attorney General of the United States."

Mr. Justice McReynolds: Is that the only thing he is authorized to do under the act?

Mr. Adcock: That is the only thing.

Mr. Justice McReynolds: And what did he ask in this case?

Mr. Adcock: He asked that the appellant be enjoined from diverting from Lake Michigan any waters in excess of 4,167 feet.

Mr. Justice McReynolds: Well, was that an attack on structures, or what was it?

Mr. Adcock: He attacked our right to take that quantity of water—in excess of that quantity.

Mr. Justice VanDevanter: Well, the bill was framed with the idea that you did have the right to take some water, was it?

Mr. Adcock: It was framed with the idea that we had the right to take 4,167 seconds feet.

Mr. Justice VanDevanter: He assailed the right to take anything in excess of that?

Mr. Adcock: Yes, sir.

Mr. Justice VanDevanter: On what ground did the bill proceed?

Mr. Adcock: The bill proceeded on this ground—perhaps I should state that there were two suits here; and I was just about to state the issues which are involved—

Mr. Justice VanDevanter (Interposing): Were they brought at the same time?

Mr. Adcock: No. The first suit was brought March 23, 1908; and the second one was brought October 6, 1913. The first one was consolidated with the second one. I do not believe, so far as the Court is concerned, it is necessary to give much attention to the first suit; because it only involved an adjunct to the main diversion channel; and the second suit was instituted to enjoin the diversion from any and all sources in excess of a certain amount.

And that second bill of complaint set up the organization of appellant under this act of May 29, 1889; and the construction of the works; and alleged that it was withdrawing from Lake Michigan an amount of water in excess of 4,167 seconds

feet, which was the limitation that it was claimed by the bill that the Secretary of War had placed upon the amount of the withdrawal.

It also set up the issuance of various permits. The first permit was issued May 8, 1899, and was unlimited in amount.

The Chief Justice: We will suspend at this point.

Thereupon, at 2:00 o'clock p. m., the Court took a recess until 2:30 o'clock p. m.

AFTER RECESS.

Oral argument of Edmund D. Adcock, Esq.,—Resumed.

The Chief Justice: Mr. Adcock, you may proceed.

Mr. Adcock: I had started to answer a question at the time of the recess.

Mr. Justice VanDevanter: With regard to that permit that you spoke of: To what extent had permits been issued before this suit was begun, and what, if any, restrictions were there in those permits?

Mr. Adcock: The first permit, for the opening of the main channel, provided that it should cause the water to flow through the channel, subject simply to three conditions. That is known as the permit of May 8, 1899.

One condition was, that if Congress should act to modify or control the amount of the diversion, then the permit should be of no further force or effect. Of course, I take it that that is the law anyway.

The second condition was that if the withdrawal of this water from Lake Michigan through the channels of the Chicago River and its branches to the Sanitary and Ship Canal, should create a current unduly destructive to navigation, or

unreasonably destructive to navigation on that river, then the Secretary of War might close said discharge, or modify it.

There was just one other condition, a third condition, which I do not think is material here, and that is that the Sanitary District should be responsible for damages; and that was held in the *Corrigan* case, to apply only so far as the United States was concerned.

Mr. Justice VanDevanter: Now, is it true that in the beginning the Chicago River flowed into Lake Michigan?

Mr. Adcock: Yes, sir, in its natural condition.

Mr. Justice VanDevanter: And that the natural flow of the rivers and lakes beyond the Chicago River to the west go through to the Mississippi River?

Mr. Adcock: Yes, sir.

Mr. Justice VanDevanter: And that you opened the channel through, and thereby you reversed the natural flow of the Chicago River?

Mr. Adcock: Yes, sir.

Mr. Justice VanDevanter: So that you carry the water away from Lake Michigan?

Mr. Adcock: Yes; a certain quantity of water is diverted by our channel—

Mr. Justice VanDevanter (Interposing): Now, certain permits were issued by the Secretary of War?

Mr. Adcock: Yes, sir.

Mr. Justice VanDevanter: Were they permits directly to divert, or were they permits authorizing or extending to the construction of these improvements, which had as their object this diversion of waters?

Mr. Adcock: The first permit provided that the channel—that is, the channel that had then been constructed—might be opened through the Chicago River to flow through the Chicago

River to that channel, subject to the conditions which I have mentioned.

Now, the Chicago River and its branches—perhaps I can show you better on this map which we have set up—

Mr. Justice VanDevanter (Interposing): Before you get to that, where did your limit of 4,167 feet come in? Where does that come in?

Mr. Adcock: There was a later limitation, or an order made by the Secretary of War limiting the amount of that diversion to 4,167 feet.

Mr. Justice VanDevanter: When was that made?

Mr. Adcock: That was on December 5, 1901; and it was made solely because of the current in the Chicago River, and made because of objections by navigation interests at that time.

Now, right there is the very important proposition in this case: At the time that this limitation was made, the channels of the Chicago River and its branches were like this—Here (indicating on map) we have a map showing the Sanitary District works; and the limits of the Sanitary District (indicating); and also the Continental Divide, which you, Mr. Justice VanDevanter, spoke about, through which this channel is cut (indicating), which is a very small elevation of land, about seven or eight miles from Lake Michigan; and only seven or eight feet above the mean level of Lake Michigan.

The Chicago River—the main river—is shown on this map in blue (indicating); and it extends from Lake Michigan out about a mile west. Then we have the south branch of the Chicago River, running in a southerly and southwesterly direction (indicating); and then we have the West Fork of the south branch (indicating), which connects with it; and the main Sanitary and Ship Canal (indicating), the northern terminus of which is on the West Fork of the south branch, at Robey Street, in Chicago (indicating); and the main channel

extends from that point (indicating), Robey Street; and the West Fork of the south branch, twenty-eight miles, to a point just above Joliet, in Will County, and extends through Cook County—

The Chief Justice (Interposing): Is there not another river, the Calumet River, there?

Mr. Adcock: Yes, sir; that is the one that your Honor had to do with; that is an adjunct of the main channel.

The Chief Justice: Well, that runs into Lake Michigan, naturally, does it not?

Mr. Adcock: The Sag channel? The Calumet River runs into Lake Michigan naturally; and the Sag channel, or the "Calumet Sag channel," as it is called, runs from the Little Calumet River at this point (indicating), at Blue Island, westerly to the main channel at Sag, Illinois, and is merely an adjunct of the main channel. And it was designed to take care of the drainage south of the earlier limits of the Sanitary District.

Mr. Justice Sanford: Does that reverse the flow of the Calumet River?

Mr. Adcock: Yes, sir, that reverses the flow of Calumet River.

Mr. Justice McReynolds: Now, you came and asked the Secretary of War for a permit to divert this water upstream?

Mr. Adcock: Yes, sir, and to open the channel.

Mr. Justice McReynolds: And he gave you the permit?

Mr. Adcock: He gave us the permit.

Mr. Justice McReynolds: Under certain conditions?

Mr. Adcock: Yes, sir, under certain conditions.

Mr. Justice McReynolds: Well, how did this suit arise? Was it because you had violated those conditions, or what was it?

Mr. Adcock: The Secretary on December 5, 1901, limited—

Mr. Justice McReynolds (Interposing): Did what?

Mr. Adcock: Limited the amount of the diversion, and specified that it should not be over 4,167 seconds feet.

Mr. Justice McReynolds: He had authority to do that, did he?

Mr. Adcock: There is a question as to whether he had any power to regulate. I think he did have the power to limit the diversion because of the current in the Chicago River; but for no other reason. I think the power did not exist in him to limit or control the quantity of the water, so far as any other conditions were concerned. His one duty as an administrative officer was with reference to our works as they affected the Chicago River.

Now, coming to this proposition: The Chicago River at the time that limitation was made was very shallow. It was only 16 or 17 feet deep, and as narrow as 80 or 90 feet at places; and at that time the Secretary of War limited the diversion because of that condition.

The Sanitary District, however, in cooperation, as we will show later, with the Government, and appreciating that it was necessary to enlarge the channels of the Chicago River and its branches, in order to take the amount of water required through them, without creating a current unduly obstructive to navigation in the river, applied to the Secretary of War for permission to so enlarge those rivers that the larger diversion could be taken through without creating this current.

And accordingly, applications were made very shortly after the channel was open, which was January 17, 1900. I mention that fact, because it is one of the guide posts of the litigation: It applied to the Secretary of War to permit it to deepen the South Branch and the West Fork of the South Branch, from the northern terminus of the channel that had been constructed

through the Chicago River, to twenty-six feet, and widen it at all points to 200 feet.

Now, that entailed the complete enlargement of that river, the raising of bridges, the replacement of old center pier bridges with modern bascules; and the expense that the Sanitary District was put to in that improvement was upwards of $10,500,000. The Secretary of War on July 11, 1900, pursuant to applications, authorized the work to be done; that is, the work of enlarging these rivers, and the work was completed about the year 1912.

The limitation that is spoken of—the December 5, 1901, limitation—which was made when the river was in the shallow and narrow condition, is the basis of this lawsuit. That is the sole ground upon which the Government brought its injunction.

Mr. Justice VanDevanter: That limitation was not revoked when the last permit for enlargement was granted?

Mr. Adcock: It happens that the December 5, 1901, limitation, the basis of the lawsuit, was made after the permits of July 11, 1900, but before the work under those July 11, 1900, permits had been completed.

Mr. Justice McReynolds: What were the conditions of the permit of 1901?

Mr. Adcock: The conditions of the permit? The limitation was made under condition 2 of the original permit, and the limitations were, as we conceive them, the same as the limitations of the original permit.

Mr. Justice McReynolds: What were they? Please tell me that.

Mr. Adcock: I will read that permit, if I may. In order to get at that permit, it is necessary to read the first limitation; there was a limitation made on the 9th of April, 1901,

which appears at page 23 of our narrative statement, and which reads as follows:

> "Whereas, under date of May 8th, 1899, the Secretary of War granted permission unto The Sanitary District of Chicago to open the artificial channel from Robey Street, Chicago, to Lockport, and cause the waters of Chicago River to flow into the same, upon the following condition, *inter alia*:"

And then it quotes the condition 2 of the original permit:

> "'(2) That if, at any time, it becomes apparent that the current created by such drainage works in the south and main branches of Chicago River be unreasonably obstructive to navigation or injurious to property, the Secretary of War reserves the right to close said discharge through said channel or to modify it to such extent as may be demanded by navigation and property interests along said Chicago River and its south branch.'
>
> "And whereas, It is alleged by various commercial and navigation interests that the present discharge from the river into the Drainage Canal sometimes exceeds three hundred thousand (300,000) cubic feet per minute, causing a velocity of nearly three (3) miles per hour, which greatly endangers navigation, in the present condition of the river.
>
> "Now, therefore, This is to certify that the Secretary of War, upon the recommendation of the Chief of Engineers, hereby directs said Sanitary District to regulate the discharge from the river into the Drainage Canal so that the maximum flow through the Chicago River and its south branch shall not exceed two hundred thousand (200,000) cubic feet per minute."

Then on July 23, 1901, that permit was again changed as to amount, by simply permitting the Sanitary District to take through the river 300,000 cubic feet per minute, between the hours of 4:00 p. m. and 12:00 o'clock midnight; that is the time when there was not much navigation on the river.

We have the permit of December 5, 1901, which is at page 24 of appellant's narrative, and which reads as follows—and this is the one upon which this suit is based.

Mr. Justice Brandeis: And the last one that was issued?

Mr. Adcock: Not the last one. I will come to that later. The other one was only a temporary matter. This permit of December 5, 1901, reads as follows:

"Whereas, Under date of May 8th, 1899, the Secretary of War granted permission unto the Sanitary District of Chicago to open the artificial channel from Robey Street, Chicago, to Lockport, and cause the waters of Chicago River to flow into the same, upon the following conditions, *inter alia*."

And after again quoting condition 2, it continues:

"And whereas, the Secretary of War subsequently directed said Sanitary District of Chicago, to regulate the discharge of water into the Chicago Drainage Canal so that the maximum flow through the Chicago River shall not exceed 200,000 cubic feet per minute from midnight to 4 p. m., nor 300,000 cubic feet per minute from 4 p. m. to midnight;

"And whereas, Said Sanitary District of Chicago has applied to the Secretary of War for permission to increase the flow between midnight and 4 p. m., daily, to 250,000 cubic feet per minute; and the Chief of Engineers has recommended that the increase applied for be granted, but that the rate of flow from 4 p. m. to midnight be reduced to 250,000 cubic feet per minute, so that the flow through the Chicago River shall not exceed 250,000 cubic feet per minute throughout the 24 hours of the day.

"Now, therefore, This is to certify that, in accordance with the recommendation of the Chief of Engineers, the Secretary of War hereby gives unto the Said Sanitary District of Chicago permission to regulate said discharge so that the maximum flow through the Chicago River shall not exceed 250,000 cubic feet per minute throughout the 24 hours of the day, upon the following conditions:

"(1) That this permission shall be in lieu of the present authorized rates of flow as stated above.

"(2) That the permission herein given shall be subject to such modification as in the opinion of the Secretary of War the public interests may from time to time require.

"(3) That said Sanitary District of Chicago shall be responsible for all damages inflicted upon navigation interests by reason of the increase in flow herein authorized."

Then on January 17, 1903—and all these limitations were before the work of the improvement, the enlargement of the Chicago River, under the July 11, 1900, permits was completed—. On January 17, 1903, a permit was issued allowing the Sanitary District to increase the withdrawal or discharge through the Chicago River to 350,000 cubic feet per minute, during the winter months.

Mr. Justice McReynolds: Well, all of that is just detail leading up to your final conclusion, is it not?

Mr. Adcock: Yes, sir.

Mr. Justice McReynolds: Well, what is the final thing that you are contending for?

Mr. Adcock: Well, our proposition is simply this: That so far as these permits are concerned, we have complied with every condition made by the Secretary of War as to the current in the Chicago River, which was the only condition that he placed upon our withdrawal of the waters—

Mr. Justice McReynolds (Interposing): And therefore you claim you have the right to take out an unlimited quantity of water : Is that your conclusion?

Mr. Adcock: No. We have the right to take the amount fixed by our Illinois act, and the amount which we have provided by our works to take, which is approximately 10,000 seconds feet of water.

Mr. Justice McReynolds: And the Secretary of War has nothing to do with it?

Mr. Adcock: The Secretary of War has nothing to do with the quantity that we might take from Lake Michigan, except in so far as the taking of that water through the channels

of the Chicago River and its branches might effect those river channels or navigation thereon.

Mr. Justice McReynolds: Wholly without regard to the Secretary of War's opinion in regard to the navigability of the Lakes as affected by that diversion?

Mr. Adcock: Yes.

Mr. Justice McReynolds: Is that the issue in this case?

Mr. Adcock: That is one of the issues, your Honor.

Mr. Justice McKenna: What is the other issue?

Mr. Adcock: Another situation is this: That under the act of March 2, 1827, we were authorized—that is, the State of Illinois was authorized, to build a canal from Lake Michigan to the Illinois River, uniting the waters of Lake Michigan with those of the Illinois River.

Mr. Justice Holmes: What was the date of that act?

Mr. Adcock: March 2, 1827.

Mr. Justice McReynolds: Was anything said about the size of the canal in the act?

Mr. Adcock: No. The State was to exercise its discretion in that respect. There was no limitation as to the size of the canal.

Mr. Justice McReynolds: And nothing was done until 1900?

Mr. Adcock: A canal was built in 1848 by the State.

Now, that is the situation, so far as the permits are concerned.

And it is also to be said, as to the act of March 2, 1827—there is a whole lot more to that proposition, as to the authority of Congress, or the authority given by Congress to the State of Illinois than merely the act of March 2, 1827; there are many circumstances that must be taken into consideration before that proposition can be left.

Mr. Justice Brandeis: Is there any contested question of fact to which we must address our attention?

Mr. Adcock: There is this question of fact: It is claimed by the Government that the withdrawal of the water in excess of 4,167 seconds feet will lower the levels of the Great Lakes and the connecting canals, and thereby injure navigation.

Mr. Justice Sutherland: On the Lakes?

Mr. Adcock: On the Lakes. There is also the allegation as to the Chicago River. There may be a question, some small question, of fact as to the current of the Chicago River.

On that proposition we merely say this: That no evidence was introduced by the Government as to the current in the Chicago River until after all of our evidence was put in. It was merely rebuttal, and I believe an afterthought. The only testimony was the testimony of certain Lake captains as to what they thought the current was there in the Chicago River and its branches when their boats met other boats, or were abreast of other boats.

On the other hand, we had the testimony of our chief engineer, Mr. Isham Randolph, who laid out the works, and who testified that there could be taken through the river, and that he planned the works so as to take the 10,000 cubic feet per second through the channels of those rivers and there would not be a current of over a mile and a quarter an hour —that is, under the enlarged improvement. And Mr. Wisner also testified to that; he was chief engineer of the Sanitary District for a time. The report of General Bixby, who was one of the chief of engineers of the United States Army, in 1906, with reference to the conditions of current in the Chicago River, stated that the current would not exceed 1.2 miles per hour. That is all set forth in the brief.

So that Secretary of War Stimson in 1913, when he refused the application to remove this limitation and for express authority for 10,000 seconds feet diversion, made no

objection to any current in the Chicago River; and so far as we know, the Government has never found—there is no Government engineer who ever found that the improved or enlarged cross section of those rivers would create a current —or that a current would be created in those rivers with the 10,000 seconds feet taken through—

Mr. Justice McReynolds (Interposing): Now, you have the permission of the War Department to take out 300,000 cubic feet per minute, have you?

Mr. Adcock: We have permission, it is our contention, to take out through the Chicago River the amount of water that would result from the deepening and widening of the Chicago River and its branches under the July 11, 1900, permits.

Mr. Justice Brandeis: Even if that would affect the navigation of the Great Lakes?

Mr. Adcock: Yes, sir.

The Chief Justice: Was there not a reservation as to navigability?

Mr. Adcock: There was not a reservation, no, not in the permit. The only reservation was with reference to the current in the Chicago River. Our contention is this: That so far as the acts of Congress are concerned—and the only two acts that I know of are the act of September 19, 1890, and the act of March 3, 1899—there are no express words showing that Congress has intended to occupy the field as to diversions of water, or to regulate the diversions; and that it has not delegated to the Secretary of War any authority to fix or regulate the amount of diversion, but only the administrative duty with reference to the conditions that might exist in the Chicago River.

Now, that is under a general proposition of law that I think has been upheld by this Court in numerous cases; and Mr. Justice Holmes, in the case of *Missouri* v. *Illinois*, stated

that, so far as the United States is concerned, it had done nothing to forbid this diversion. That was a suit that involved this very diversion.

Mr. Justice Brandeis: Will you just pardon me if I interrupt you with a question?

Mr. Adcock: Yes, sir; certainly.

Mr. Justice Brandeis: Will you state what your position is in regard to the contention which, I understand, the Government has made, that this diversion does injuriously affect the navigation on the Great Lakes?

Mr. Adcock: Our position is merely this on that question: No witness was ever presented in this case to testify as to observing any lowering of the levels of the Lakes, or as to any injury to navigation. Nobody testified that they were unable to load a boat as heavy because of this diversion.

Mr. Justice Brandeis: Well, do you deny that navigation upon the Lakes is affected?

Mr. Adcock: Yes, sir.

Mr. Justice Brandeis (Continuing): By the diversion? You deny that, do you?

Mr. Adcock: We take this position, your Honor: That there is no evidence in the record from which it can be determined that any injury did exist to navigation by reason of the claimed lowering of the surface elevations of the Lake —that is, Lake Michigan—some five inches, as claimed here, and Lakes Erie and Ontario certain smaller amounts.

Mr. Justice Brandeis: And is it also your contention that, if the Government, through the Chief of Engineers, has reached the conclusion that the diversion would injuriously affect navigation, that is an immaterial fact?

Mr. Adcock: It is an immaterial fact; because the Chief of Engineers—and the Secretary of War can only act upon the recommendation of the Chief of Engineers—has not been delegated that authority.

And then our further proposition is that, by other acts of Congress, some fifteen or so in number, Congress has recognized this diversion; has sought to provide for its continuance, and has not only not forbidden it, but has done things which would indicate an intention that it should exist.

Mr. Justice Brandeis: And you mean by recognizing the diversion that it recognized the amount of the diversion, and not merely the fact that there was some diversion?

Mr. Adcock: Yes, sir.

The Chief Justice: Mr. Adcock, the permit that you refer to is that signed by W. Cary Sanger, Assistant Secretary of War, dated December 5, 1901?

Mr. Adcock: Yes, your Honor.

The Chief Justice: Now, that provides that "the Secretary of War reserves the right to close said discharge through such channel, or to modify it to such extent as may be demanded by navigation?"

Mr. Adcock: Yes.

The Chief Justice (Continuing): "demanded by navigation and property interests along said Chicago River and its south branch?"

Mr. Adcock: Yes, sir.

The Chief Justice: Now, you claim, do you, that that navigation mentioned there is limited only to the navigation on the Chicago River?

Mr. Adcock: Yes, sir, because the original permit was limited only to that. That was the condition to the original permit, and the Secretary of War was acting only under Condition 2 in limiting it to that amount.

The Chief Justice: And then a further condition, No. 2, is:

> "That the permission herein given shall be subject to such modification as in the opinion of the Secretary of War the public interests may from time to time require."

Mr. Adcock: Yes, sir.

The Chief Justice; Now, do you say that—

Mr. Adcock (Interposing): Yes, sir, we say that that does not enlarge Condition 2 of the original permit, because the limitation was made by virtue of Condition 2 of the original permit.

Mr. Justice McReynolds: What did the court below hold on these issues?

Mr. Adcock: The court held that the Secretary of War had the authority to limit this discharge; that is, that because the Sanitary District found itself in this lawsuit without an express authorization by the Secretary of War as to the amount, the injunction must follow; that it did not make any difference how it happened that the express authorization did not exist. It is our position that that December 5, 1901, permit—

Mr. Justice McReynolds (Interposing): If you will tell me what the court decided, I will be much obliged to you.

Mr. Adcock: That is what the court decided.

Mr. Justice McReynolds: The court decided that the Secretary of War had power to control this situation?

Mr. Adcock: Yes, sir.

Mr. Justice McReynolds: And that he issued an order limiting you to so much water?

Mr. Adcock: Yes, sir.

Mr. Justice McReynolds: And that you must not exceed it; is that right?

Mr. Adcock: That is right. And that it did not make any difference whether the cause of that limitation had been removed or not. It is our position that, when the limitation of 4,167 seconds feet was made there was a reason for it, because of the restricted condition of the river, but that

when we removed that reason, then necessarily the limitation itself would have no further force or effect.

Mr. Justice McReynolds: Did the Secretary of War decide that you had removed that limitation?

Mr. Adcock: That we had removed the limitation? There is no statement by the Secretary of War as to any current in the Chicago River unreasonably obstructive to navigation, but there was only a current therein of a mile and a quarter an hour, which was the amount that the Secretary of War indicated would be satisfactory.

The Chief Justice: Did the district judge rule, in effect, that these reservations by the Secretary of War gave him complete control?

Mr. Adcock: No. He simply held that, because we did not have an express authority as to an amount—that is, because the Secretary of War had not removed that limitation, it did not make any difference why he failed to remove the limitation; that for that reason, the injunction should follow.

Mr. Justice VanDevanter: In other words, the court recognized that there might be other reasons why that limitation should be preserved, and that even though one reason was removed, the others might still subsist?

Mr. Adcock: Yes, sir—that he might not like the color of the applicant's eyes.

Mr. Justice Brandeis: And did the court make any finding of fact in the matters which you say are in issue?

Mr. Adcock: No. There was simply a short decree.

Mr. Justice VanDevanter: Was it shown or admitted that the level of the Lakes was a good deal lowered?

Mr. Adcock: No; we do not admit that.

Mr. Justice VanDevanter: Well, was it shown in the evidence?

Mr. Adcock: There were many expert witnesses put on the stand who testified as to the determination of increment of these various outlet rivers, and that from that, theoretically, Lakes Michigan and Huron would be five inches less in depth because of this diversion, and that the surface elevation would be that much lower than it would have been.

Mr. Justice VanDevanter: Well, did they state that they had measured the water and found that there was that much difference in the level of the lakes?

Mr. Adcock: No; they made no measurement showing that. They made a great number of measurements of the discharge of these outlet rivers; and they took from the records the stage of the controlling lake at that time; and from those discharge measurements they attempted to obtain the increment of the outlet rivers. Now, an increment is the increase or decrease in the flow of the outlet river, due to the rise or fall of the controlling lake stage of one foot. And having determined the increment, they then divided the amount of the diversion—say 10,000 seconds feet—by the amount of the increment; and the fraction that was obtained represented the fraction of a foot that it was claimed the lakes were lowered.

Now, there were a great many things that had to be done, and done accurately, in order to make a discharge measurement, or a number of discharge measurements of these outlet rivers. The actual elevations—the mean elevations—of the lakes for the ten years immediately preceding the opening of this channel were lower than they were for the ten years subsequently thereto. There are a great many things that enter into the determination of the levels of the lakes. They fluctuate from time to time. Perhaps I could just show you that here on this map (indicating).

The lake levels were higher after the opening of the channel than they were before.

Mr. Justice VanDevanter: Habitually, or only for a time?

Mr. Adcock: Ten years; the ten-year mean elevation.

Mr. Justice VanDevanter: Then what happened?

Mr. Adcock: Well, the testimony in this case was practically closed in 1914; and that ten-year period is the only comparison that was made. I think I have here (indicating) the map which shows that. That (indicating) is a hydrograph of the Great Lakes, and shows the fluctuations from year to year, from 1860, to the end of 1914 in the lake surfaces. Lake Superior is not claimed to be affected in any way.

Mr. Justice Brandeis: What is that dip that you have there on the map?

Mr. Adcock: This dip here (indicating)?

Mr. Justice Brandeis: No; further up; a little further along.

Mr. Adcock: That condition is due to the fact that at this time, or about this time, I think Lake Superior was regulated. That is, movable dams were put in the St. Mary's River to regulate the level of Lake Superior, and so as to keep it within smaller limits than the others. And that was done for the benefit of the water power there.

Mr. Justice VanDevanter: Since then there has been less fluctuation?

Mr. Adcock: So far as Lake Superior is concerned. I think it has been kept within probably a foot and a half. You see, before that—here (indicating on map) is the figure for 1900. There were fluctuations, just the same as existed afterwards; and that is due to the supply which comes from rain on the surface of the lakes, and also on the drainage areas.

Mr. Justice VanDevanter: Near your right hand on the map is Lake Superior; what is that lowest figure shown there?

Mr. Adcock: That (indicating) is 1911. That was the low water time.

Now, in connection with that proposition, we show that in 1903, practically all of these critical points of navigation were improved by the United States. That reference plane of the improvement was placed approximately six inches lower, as the engineer testified, as the claimed effect on Lake Michigan. And the testimony also shows that the only vessels there claimed to be affected by this diversion are the ore-carrying vessels.

We have in this record a table which shows the ports between which the ore-carrying vessels ply, which shows that there have at all times been depths of water greater than the project depths as fixed by Congress, and that all these harbors—all these critical points of navigation—were improved under appropriations by Congress, and what navigation there is now has been entirely provided for by appropriations of Congress—that is, in supplying greater depths, etc.; and the depths are greater than the natural channels provided before there was any improvement. And that therefore, Congress, presumably, has taken care of this diversion.

Mr. Justice Butler: Is there any testimony in the record as to conditions since 1914? Or is there anything to show what volume of water per second has been taken from Lake Michigan since that time?

Mr. Adcock: By the Sanitary District?

Mr. Justice Butler: Yes.

Mr. Adcock: There was testimony put in in 1923, just before this decree was entered, which showed the population of the Sanitary District at that time. The population was shown in 1914, and the increase was at the rate of about 72,000 a year. And the statute expressly provided how much water should be taken.

Mr. Justice Butler: How much was taken?

Mr. Adcock: 10,000 seconds feet.

Mr. Justice Butler: 10,000 seconds feet?

Mr. Adcock: Yes, sir; they had 3,000,000 inhabitants, and that was the amount that was required according to the statute.

Mr. Justice Butler: How long has that amount been taken? I am trying to get at the situation which has developed since the taking of the testimony or the making of the records.

Mr. Adcock: That has developed progressively since 1900, when the population was about a million and a half. And I think in 1913 the population was about 2,500,000, and the increase is about half a million between that time and 1923—perhaps a little more.

Mr. Justice VanDevanter: And the lake levels you have not brought down to 1923?

Mr. Adcock: That has not been done. All that hydraulic testimony was put in by 1914. The later testimony that was put in, 1923, was more in relation to the settlement of the decree.

Mr. Justice Brandeis: How much have you increased the draft in the ten years from the year 1914 to date?

Mr. Adcock: How much have we increased the draft?

Mr. Justice Brandeis: Yes.

Mr. Adcock: The draft of vessels?

Mr. Justice Brandeis: No, the water—the drawing off of water by you?

Mr. Adcock: Oh. There has been an increase of about 2,500 seconds feet in the amount of water drawn; I think about that. That has been according to the population. I think it was about 7,500 seconds feet in 1914.

Mr. Justice Brandeis: You have increased it about 2,500 seconds feet?

Mr. Adcock: Yes, sir.

The Chief Justice: Mr. Adcock, before you go on, you referred to section 12 and section 10 of the act of 1899.

Mr. Adcock: Yes, sir.

The Chief Justice: I understood you to say that there was no authority, in your judgment, to get an injunction against what was here enjoined?

Mr. Adcock: Yes, sir.

The Chief Justice: Because the act referred only to an injunction against the removal of any structures or parts of structures?

Mr. Adcock: Yes, sir.

The Chief Justice (Continuing): erected in violation of the previous section. Have you not got to refer back to section 10 in order to find out what that means? Does not section 10 provide "that it shall not be lawful to excavate and fill, or in any manner, alter, or modify the course, location, condition, or capacity—"

Mr. Adcock (Interposing): Yes, sir.

The Chief Justice (Continuing): "of any port, roadstead, haven, harbor, canal, lake," and so on, or the channel of any navigable water of the United States. Is that not incorporated into section 12?

Mr. Adcock: But it expressly provides for the removal of a structure or part of a structure. Now, if you will notice section 10—

The Chief Justice (Interposing): Well, you have put in a good deal of the structure, have you not?

Mr. Adcock: The purpose here—what is sought in this suit is merely an injunction against the operation, or the continuance, as they claim, of an obstruction.

Now, if you will notice, section 10 of the act of 1890, which is printed on page 109 of my brief opposite the act of 1899, provides that:

"The creating or continuing of any unlawful obstruction in this act mentioned may be prevented and such obstruction may be caused to be removed by the injunction of any circuit court exercising jurisdiction in any district in which such obstruction may be threatened or may exist; and proper proceedings in equity to this end may be instituted under the direction of the Attorney General of the United States."

In other words, the old act properly provided for the institution of a suit of this kind for the relief here sought; whereas the new act does not provide for that; and it must have been the intention of Congress that the Attorney General should not have that power; otherwise, why the change?

The Chief Justice: Do you mean that Congress deliberately left out the remedy by injunction where what was done would alter or modify the "course, condition, location, or capacity of any port" etc.?

Mr. Adcock: It only related to the removal of a structure, and that was what the Secretary of War had to do with. That is, all of the things that are named in sections 9 and 10 that he may authorize are structures; that is, something built in navigable waters; something that occupies some position in those waters. And there is no provision for an injunction to remove an obstruction.

Now, this channel that was constructed here (indicating on map) is the main Sanitary and Ship Canal, as I pointed out. The lower end of that canal (indicating) is 36 miles from Lake Michigan. It is 26 feet deep and 165 feet wide in the rock section, and 225 in the earth section.

Section 23 of the act provided that, if a canal were cut through the rocky divide, or the Continental Divide, it should have a capacity of not less than 600,000 cubic feet per minute, or 10,000 cubic feet per second.

You will notice here (indicating on map) a blue line, here towards the bottom. That is the old Illinois and Michigan

canal. And that has been entirely abandoned, replaced and supplanted by the new canal, as held by the Supreme Court of Illinois.

Now, in regard to this March 2, 1827 act, I want to simply refer to some of the things that transpired prior to the time that act was passed and after its passage, and while the State of Illinois was exercising its power under that act.

Mr. Justice Sutherland: Before you come to that, may I ask you this question about section 12?

Mr. Adcock: Yes, sir.

Mr. Justice Sutherland: Is it your contention that, unless the suit can be maintained under the provisions of section 12 it cannot be maintained at all?

Mr. Adcock: Yes, sir: That Congress provided the method for the removal of structures that had been put in navigable waters contrary to the provisions of sections 9 and 10 and other sections of that act.

Mr. Justice Sutherland: Well, could not the United States maintain a suit to prevent obstructions to navigation independently of that law?

Mr. Adcock: I do believe that with that act—I believe that it is shown by the passage of these acts that it was intended by Congress that this method should be followed. There may be a question as to that. I simply want to make the point, your Honor.

Mr. Justice VanDevanter: Well, suppose you did not have this provision that you have referred to, in the latter part of section 12; suppose it was not there: Would you say that no suit could be brought?

Mr. Adcock: No.

Mr. Justice VanDevanter (Continuing): To remove obstructions?

Mr. Adcock: No.

Mr. Justice VanDevanter: You think that is necessary in order to remove obstructions?

Mr. Adcock: I think they simply put it there in order to—

Mr. Justice VanDevanter (Interposing): You think they could not have brought a suit without that section?

Mr. Adcock: I believe they could have, under their general power—

Mr. Justice VanDevanter (Interposing): Now, they have not taken away the power to bring a suit against other things that are in violation of the act. Why do you say that this power does not exist?

Mr. Adcock: Well, merely this: That Congress under these acts has provided a plan by which these structures may be removed. For instance, under section 18 of the act which relates to the changing of bridges, there is no provision for an injunction. The only provision there is for a fine. And the Secretary of War must follow a certain procedure. He has got to have a hearing, and provide that the bridge shall be altered or modified—

Mr. Justice VanDevanter (Interposing): You are familiar with the *Elephant Butte* case, are you not?

Mr. Adcock: What is the name of it?

Mr. Justice VanDevanter: The *Elephant Butte* case?

Mr. Adcock: I do not recall it just now.

Mr. Justice VanDevanter: Well, it involved a dam in New Mexico and Colorado; and it was there found that one of the affluents of the Rio Grande River was being tapped and the water was being taken out.

Mr. Adcock: Do you mean the *Rio Grande Dam & Irrigation Co.* case?

Mr. Justice VanDevanter: Yes.

Mr. Adcock: I know that case, of course.

Mr. Justice VanDevanter: And the United States brought a suit to prevent that obstruction, on the ground that it was impairing the navigability of the river below, and that it affected also the ability of the United States to comply with its treaty stipulations with Mexico.

Mr. Adcock: Yes; I know that case; that is in the 174 U. S. reports.

Mr. Justice VanDevanter: They did not have any difficulty there about the right to bring such a suit, did they?

Mr. Adcock: That suit was brought under the act of 1890, the language of which is entirely different. It provided for the institution of a suit of that kind. And besides, that was as to a dam being constructed—which, as the court stressed in that case, was especially mentioned in the act of 1890.

Mr. Justice VanDevanter: Do you think the *Economy Light & Power Co.* case is consistent with your view?

Mr. Adcock: That was a dam across the water; and the only question there was whether it was a navigable water of the United States or not; that was a structure; the dam had been started; they had started to build it; and of course, if they could remove a part of the structure, certainly the court could enter an injunction which would prevent them going ahead and building the structure that had been started.

Yes, those cases were cited by counsel for the Government.

Now, I would like for just a few minutes to proceed in the consideration of this act of March 2, 1827. And that has a great deal to do with the early history of this country.

We have here (indicating) a map which shows the navigation of the Mississippi waterway system. This water route (indicating) extending from Chicago here, down across the Continental Divide, which was a very small divide (indicating), the Des Plaines and Illinois Rivers (indicating) and so on to the Gulf of Mexico (indicating)—is a very old plan.

And in the laying out of the Northwest Territory, under the cession of Virginia in 1783, and the Ordinance of 1787, the question of the development of this water route was under consideration; and originally the northern boundary of the lower three States in the Northwest Territory—that is, the territory that afterwards became those States—was a line drawn through the very southern end of Lake Michigan. When the Illinois enabling act was passed, the day it was passed it was amended to provide for the new state, the port here at Chicago (indicating on map) and a certain amount of territory back of it, in order to support that, and in order that the water route should be entirely within Illinois. And as it was stated in the resolution presented by Mr. Pope for the amendment of the enabling act in order to cover this additional territory, the fact that the water route was all within Illinois, would draw the attention of the State of Illinois to the development of the waterway.

Then in 1822, Congress passed the act of March 30, 1822, which was the first act of Congress with reference to the development of this waterway, which provided; the title of the act was as follows:

> "An act to authorize the State of Illinois to open a canal through the public lands to connect the Illinois River with Lake Michigan."

A portion of said act reads as follows:

> "That the State of Illinois be, and is hereby authorized to survey and mark through the public lands of the United States, the route of the canal connecting the Illinois River with the southern bend of Lake Michigan; and ninety feet of land on each side of that canal shall be forever reserved from any sale to be made by the United States."

Now, that act ceased to have any force and effect because there were certain things that Illinois was to do within a period of years, that it did not do. And in 1826 the Gen-

eral Assembly of Illinois memorialized Congress with reference to the construction of a canal and the importance of it.

On March 2, 1827, Congress passed another act, which had substantially the same title, and which provided:

> "That there be and hereby is granted to the State of Illinois, for the purpose of aiding the said State in opening a canal to unite the waters of the Illinois River with those of Lake Michigan, a quantity of land equal to one-half of five sections in width, on each side of said canal, and reserving each alternate section to the United States, to be selected by the Commissioner of the Land Office, under the direction of the President of the United States, from one end of the said canal to the other; and the said land shall be subject to the disposal of the Legislature of the said State, for the purpose aforesaid, and no other; provided, that the said canal when completed shall be and forever remain a public highway for the use of the Government of the United States, free from any toll, or other charge, whatever, for any property of the United States, or persons in their service passing through same."

Now, in 1822 and 1824, the government of Great Britain refused to the citizens of the United States the free navigation of the St. Lawrence River, and that question was not settled until the treaty of 1854.

I am referring to these facts with reference to the enabling act of Illinois, and the actions of Great Britain, to show the intention to construct a canal of a certain size, and to create and enlarge this waterway to the dimensions that the Government had in mind at that time.

On January 9, 1836, the State of Illinois passed an act under which the Illinois and Michigan Canal—the one I pointed out on the map, which extends down to Utica, on the Illinois River, about 100 miles—under which act that was built. Section 16 of that act provided that the canal should be of a certain width and should be supplied with water from Lake Michigan, and from such other sources as the canal commissioners might provide.

And in fact, Lake Michigan was the only place from which they could get water for the operation of the canal; and it was the only place for the upper section of the canal which could cross through the Continental Divide. And it also provided that there should be reserved on each side of the canal 90 feet, for the purpose of enlargement. And you will recall that the act of March 30, 1822—that is, the act of Congress, had a similar provision, that there should be reserved a certain amount for enlargement.

So we have the width of the original canal, which would be 45 feet—that is, the canal itself—and the amount reserved, 90 feet on each side, for enlargements, which would make a canal 225 feet in width.

The canal was completed in 1848; and at that time the diversion of water from Lake Michigan commenced. It was not completed, however, on the original plan, because of lack of funds, so far as the upper stretch was concerned. It was completed on what was called the "shallow cut plan."

In 1861, the General Assembly of Illinois authorized and empowered the canal commissioners to make a survey for the improvement of this canal—an improvement of the waterway. It was not only the enlargement of the canal, but also for the purpose of providing water so that the Illinois River would be made deeper and they would have depths there for navigation purposes—

Mr. Beck (Interposing): Mr. Adcock, would you mind explaining to the Court that this is not the canal that is in suit?

Mr. Adcock: I will come to that.

Mr. Beck: I do not want the Court to think that you are talking about the canal in controversy.

Mr. Adcock: No, I will come to that.

Mr. McReynolds: Is this canal in operation now?

Mr. Adcock: No.

Mr. Justice McReynolds: When was it abandoned?

Mr. Adcock: The canal is in operation from Joliet, this point (indicating on map) south to Utica. It is not in operation from Joliet north, because it has been supplanted by the Sanitary and Ship Canal that is here in controversy; and it has been entirely abandoned, and that has taken its place; and instead of maintaining the old canal, they build a new one right alongside it, which took the place of it, and was under the provisions of the 1827 act.

In fact, our organic act provided that we might occupy the site of that canal, if it were necessary; that is, if we desired to do it. But we did not do it, because it was cheaper to dig the canal alongside of the old canal than to build one on the site of the old canal.

Mr. Justice Sutherland: Well, did the act of 1827 fix the width of 45 feet, or did it make this additional grant of 90 feet on each side for the canal?

Mr. Adcock: No, it did not.

Mr. Justice Sutherland: What did it provide?

Mr. Adcock: It merely provided that a certain amount of land was granted to the State of Illinois, to construct a canal to unite Lake Michigan with the Illinois River. But the act of March 30, 1822, did provide that there should be reserved 90 feet on each side of the canal; and this act of 1827 was a reenactment of the old act of 1822.

Mr. Justice Sutherland: Did either act say anything about the diversion of water or the size of the canal?

Mr. Adcock: No. That was left, as we conceive, to the discretion of the State, to build a canal that it considered suitable for commerce, to be operated in such a way as it considered reasonable.

Mr. Justice Sutherland: Well, do you mean to say that that canal was 45 feet wide at that time?

Mr. Adcock: The act under which the canal was built, that is, the act of Illinois, provided that it should be not less than 45 feet wide, and that there should be reserved on each side 90 feet for enlargement of the canal.

Mr. Justice Sutherland: Was there anything provided about the depth?

Mr. Adcock: Yes, the Illinois act contained a provision as to the depth. I think it provided that it should be not less than six feet deep.

Mr. Justice Sutherland: Six feet deep?

Mr. Adcock: Yes, sir.

Mr. Justice Sutherland: And the present canal is of what depth?

Mr. Adcock: It is 26 feet deep. The idea there, I assume, is this: That if the canal is widened, it necessarily would carry a depth corresponding to the width, as commerce might require—

The Chief Justice (Interposing): Well, Mr. Adcock, in order to help us understand this as you go along, is it your contention that the United States is in a situation now where it may not deny nor prevent the taking of water from Lake Michigan for the purpose of building a canal?

Mr. Adcock: Our position is this: That the United States directly authorized us to build a canal; that there was no limitation as to how it should be built, the amount of water that should be taken—or, to put it another way, they invited Illinois to exercise its authority.

The Chief Justice: Well, you did build a canal?

Mr. Adcock: Yes, sir.

The Chief Jusice: Under that authority?

Mr. Adcock: Under that authority.

The Chief Justice: And now you are seeking to enlarge that authority by the fact of the original grant?

Mr. Adcock: No; we are simply acting under the authority, which we consider as a continuing authority, not only to build a canal which suited the demands of navigation at that time, but to maintain a canal across there which would suit the demands of navigation as they might afterwards appear. That is our proposition.

Mr. Justice Holmes: Which act are you referring to? Who do you say gave you that authority?

Mr. Adcock: Congress.

Mr. Justice Holmes: Did you say which act of Congress it was?

Mr. Adcock: The act of March 2, 1827.

And also, putting it another way, that under the act of 1827, Congress invited Illinois to exercise the authority which was reserved to it under the Constitution—that is, the police power to develop these waterways and use the canal for a waterway or for any other legitimate purpose.

Mr. Justice Brandeis: And your contention is that this grant is a preferential grant over the rights, whatever they may be, of other States, for navigation and other uses of water on the Great Lakes?

Mr. Adcock: Yes. That is, that it was granted in the interests of navigation.

Mr. Justice Brandeis: Well, I mean it was a preferential grant for navigation, so that it took precedence over any other uses that Congress might want to make of that water—or the States bordering on the Great Lakes?

Mr. Adcock: I do not think that we are in the position here, your Honor, where we take the position—or that it is necessary to determine the proposition as to what would happen if Congress should now occupy the field or exercise its power in regulating the amount of diversion for navigation purposes.

Mr. Justice Brandeis: That is, you could gradually, with the increasing demands of navigation and the size and draft of vessels—you could continue, at least until Congress otherwise provided, to increase your draft from time to time, regardless of its effect on the Great Lakes?

Mr. Adcock: So long as the acts of Illinois were reasonable and reasonably necessary for the purpose.

Mr. Justice Brandeis: Well, I mean for navigation through the canal down to the Mississippi?

Mr. Adcock: Yes, sir, so long as Congress permitted that.

Mr. Justice Sanford: Is it your contention that this increased taking of water is necessary for navigation purposes?

Mr. Adcock: It is our position, your Honor, that when the canal was provided for, that is, under the act of May 29, 1889, they had two propositions in mind—providing a canal for navigation purposes, as well as to take care of the sewage and protect the water supply. That at that time there was a demand for a deep waterway to the Gulf of Mexico, of 14 feet, and that the waterway could not be created without the diversion of water.

And I would like to refer, as I have just about come to that point, to what the United States Government did with reference to the size of a canal, with reference to a deep waterway and the idea of a diversion of water from Lake Michigan for the deep waterway; because it was necessary not only to build a canal of certain size for the increased demands of navigation, as they conceived it then, but also to provide water for the Illinois River. That is a never-failing water supply because at time of low water the flow of the Illinois River was practically nothing—from one to five hundred cubic feet per second—and this increase would give very great depth in the Illinois River, for the purposes of navigation; and this is what Illinois did in 1861—

Mr. Justice Sanford (Interposing): Was anything said in those later acts of Congress in reference to drainage, or was it merely a matter of allocation?

Mr. Adcock: No; this Court, speaking through Mr. Justice Holmes, in *Missouri* v. *Illinois*—and I think I might just as well read that here—said:

> "Some stress was laid on the proposition that Chicago is not on the natural watershed of the Mississippi because of the rise of a few feet between the DesPlaines and the Chicago River. We perceive no reason for a distinction on this ground. The natural features relied upon are of the smallest, and if under any circumstances they could effect the case, it is enough to say that Illinois brought Chicago into the Mississippi watershed, in pursuance not only of its own statutes, but also of the acts of Congress of March 30, 1822, and March 2, 1827."

And on that proposition our Supreme Court said, in the 272 Illinois, speaking through Mr. Justice Carter of that court—and that was a suit brought by a taxpayer to enjoin the construction of the Sag Channel, which is an adjunct of the main channel, and is located down here (indicating on map); and the court said:

> "Said act of 1903"—

That was an act that specially related to the Calumet Sag channel, and is not the act of May 29, 1889, which related to the main Sanitary and Ship Canal:

> "Said act of 1903 permits the crossing of the Illinois and Michigan canal near Sag bridge and provides for the abandoning of certain portions of said canal. Counsel for appellant argue that this is in violation of the Federal grant of 1822, under which the Illinois and Michigan canal was constructed, which provides, among other things: 'If said ground shall ever cease to be occupied by and used for a canal suitable for navigation, the reservation and grant hereby made shall be void and of none effect.' The canal was built under the authority of Congress of March 2, 1827, the act of 1822 having been mutually abandoned by the State and Federal governments. This Federal act did not provide

just where the canal should enter Lake Michigan, simply stating that the land was granted for the purpose of opening 'a canal to unite the waters of the Illinois River with those of Lake Michigan.'"

That is the one we call the "Sanitary and Ship Canal."

"The Sanitary District's main channel as now constructed practically complies with this act and furnishes a canal more suitable for navigation than the Illinois and Michigan canal. Furthermore, the Sag channel or cut-off is required to be navigable by said act of 1903, and the proof shows that the Calumet River is navigable to the point where it is intersected by the Sag channel. This cut-off would therefore also practically comply with both of said Federal acts as to furnishing part of the canal for connection of the Illinois River with Lake Michigan."

In 1861—referring to the resolution of the Illinois General Assembly with reference to the enlargement of this canal and enlargement of the waterway—it provided for a survey—

"of the different methods proposed or desirable for improving the navigation of the Illinois River, by dredging or excavation of the channel and wing dams, or by supplying water from Lake Michigan, through the enlargement and deepening of the Illinois and Michigan Canal, or otherwise, or by opening a channel from Lake Michigan by way of the South Branch of the Chicago River and Mud Lake to the DesPlaines River and down said Canal to a point that would secure a free, flowing, ample and never-failing supply of water, sufficient for navigation of the Illinois River at all seasons and times, * * * and to include also an estimate for the channel hereinbefore mentioned, of sufficient size to admit of full and free steamboat navigation from the Illinois River to Chicago and Lake Michigan, as well as a size sufficient for supplying water for all the deficiencies of navigation in the Illinois River, at all seasons."

The Chief Justice: What was the enacting body?

Mr. Adcock: Illinois.

The Chief Justice: The Illinois Legislature?

Mr. Adcock: Yes, the Illinois Legislature.

And President Lincoln, in his second message to Congress, in 1862—I think it was on December 1, 1862—recommended that this matter be considered, the matter of the enlargement of this waterway. So that they had in mind, not only the size of the canal, but a diversion of a quantity of water from Lake Michigan.

Now, following those—and we must have in mind also President Lincoln's message—in 1866, Congress provided for a survey of this waterway, with the idea of improving it. And General Wilson, who made the report in 1867, stated:

> "The Illinois River seems to have been especially designed by nature as the link by which the waters of Lake Michigan are to be connected with those of the Mississippi. * * * the data herein contained, together with the existence of a canal of limited capacity already in operation, demonstrate beyond a doubt that the waters of the Lake may be carried into the Illinois River through a navigable channel of any required dimensions, and at a cost which cannot be regarded as excessive when the objects to be obtained are duly considered. * * * The summit will be inexhaustible, and this cannot be said of any other practicable line of water communication between Lake Michigan and the Mississippi River."

In 1871, the Illinois and Michigan Canal was completed on the deep cut plan, by which water was taken from Lake Michigan by gravity—a greater amount than had been theretofore withdrawn.

And following that, a report was made by another engineer officer, in which he stated:

> "The improvement of the eastern portion of the Illinois and Michigan Canal involves the further cutting down of the summit level and enlarging the waterway so as to afford an unfailing supply of water from Lake Michigan for the improved Illinois River."

Mr. Justice Sutherland: What are you reading from now?

Mr. Adcock: That is in one of the reports. I am reading a quotation from my brief.

Now, there were a number of reports made by engineers pursuant to acts of Congress up until the very time that this act of May 29, 1889, was passed—all recommending that a large canal should be built across this divide to take water from Lake Michigan for the operation of the canal, and to supply water for the Illinois River.

On May 28, 1889, which is just one day before appellant's organic act was passed, the General Assembly of Illinois stated its waterway policy; that is, it was to provide a waterway of the greatest dimensions and to take water from Lake Michigan for its operation, in order to provide these needs.

Now, while all of this was going on and the canal was being enlarged for waterway purposes, the City of Chicago, which had a very rapidly growing population, used that canal in order to dispose of its sewage; that is, to partially dispose of it.

Of course, it did not divert from Lake Michigan all the drainage and sewage; but part of it was diverted. And Chicago cut down the summit level, so as to complete the canal on the deep cut plan, in order to cleanse the Chicago River.

And further, in 1883, the General Assembly of Illinois directed that Chicago should put in pumps at the northern end of this canal, in order to take more water in order to cleanse the river. The population was increasing, reaching almost a million people—with the sewage partially going into Lake Michigan. Typhoid fever was raging. In other words, we had 40 years ago, by reason of our population, the problem which Cleveland and Milwaukee only have today. Because of this aggregation of population, our water supply was polluted by virtue of the Chicago River flowing into Lake Michigan.

Consequently, the city council of Chicago appointed—or, under the authority of the city council of Chicago there was

appointed, a drainage and water supply commission, in 1886, to study the whole question of sewage disposal; and the protection of the water supply and the navigation features also.

That commission was to report not later than the next General Assembly, which was in 1887. They made their report on January 30, 1887, in which they recommended the construction of the diversion works which I have described to you here; that is, the very works which the Sanitary District has built in order to divert at all times the drainage and sewage from Lake Michigan.

The act was passed after very deliberate study; that is, our Sanitary District act. It was passed pursuant to this report of the commission. And it was pursuant to a study by the committee of the legislature which was to sit *ad interim*. The legal adviser of that committee was the late John P. Wilson, of Chicago; and Chicago went about to provide for this waterway—that is, the State of Illinois did in its legislation—and to provide at the same time for the disposition of the sewage and the protection of the water supply.

The day before this act was passed, Major Marshall, who was the engineer at Chicago, made a report, which is contained in the reports of the Chief of Engineers—and this will give you some idea as to how the United States considered this proposition, and the agitation that was then in existence as to a deep waterway from Chicago to the Gulf of Mexico. He stated:

> "Whenever the large channel contemplated by the City of Chicago for drainage is actually determined upon, in view of the fact that the channel for navigation and the channel for drainage across the Chicago divide must necessarily occupy the same field, it is evident that, to avoid duplication of expense, the channel, at least, in the expensive rock section, should be constructed based on the immediate requirements of navigation, while at the same time giving a sufficient flowage capacity to carry off the drainage of the Sanitary District."

And the act under which these works were constructed provided for these navigation features. It provided that when the canal was constructed it should be a navigable waterway of the United States, and that it should be of certain depth and velocity, etc., and not over three miles per hour, all of which was necessary for navigation.

Now, following immediately upon the passage of this act, the Sanitary District of Chicago was organized; and it was a special act; although general in scope, it was really in substance a special act. They immediately commenced the survey of this canal.

The reports of the Chief of Engineers for 1890 contained verbatim copies of our act. And each year thereafter those reports contain reports of General Marshall as to the progress of the work, the purposes of the canal, what we proposed to do, not only as to its size but the diversion of water and the amount which was fixed by the act specifically; that is, that in the rock section it should be not less than 600,000 cubic feet per minute.

On April 21, 1891, very shortly after the appellant's board was organized, it passed an ordinance which stated that they would enter upon, use, widen, deepen and improve the Chicago River and the South Branch and the West Fork, in order to make that river large enough to serve as a supply channel by which the waters of Lake Michigan should be taken through the rivers to the Sanitary and Ship Canal.

That resolution or ordinance was sent to the Secretary of War, and very shortly after that, in 1892, Congress passed the first act relating to the improvement of the Chicago River; and it is our contention in this respect that, as soon as Chicago started upon its plan of deepening and widening the South Branch and West Fork of the Chicago River, Congress then proceeded to make appropriations for the improvement of the Chicago River itself.

And in this connection, there was no work done by the United States in the improvement in the channels of those rivers, except in the Chicago River itself; the work in the South Branch and West Fork was done by the Sanitary District; the work went along together; and the work done by the Sanitary District connected with that done by the United States in the Chicago River.

I want to refer just a minute to the act of March 3, 1899, which contains a provision with reference to the improvement of the Chicago River and the cooperation going on between the United States and the Sanitary District, the appellant, in that improvement.

Mr. Kirby: Do you mean the act of Congress?

Mr. Adcock: That is the act of Congress, yes, of March 3, 1899. And this act, under which the *Tunnel cases* the *West Chicago Street Ry. Co.* v. *Chicago,* in the 201 U. S. reports, opinion by Mr. Justice Harlan, if I remember correctly. There is a provision in that act reading as follows:

> "Improving Chicago River, Ill.: For continuing improvement from its mouth to the stockyards on the South Branch and to Belmont Ave. on the North Branch, $113,000, in pursuance of the provisions of an act"—

No; this was the act of February 26, 1897, which I wanted to read first, which adopted the project reported by Major Marshall in his letter of August 9, 1893, which described the Sanitary District works, the diversion, and suggested the 21-foot improvement. Then the act of March 3, 1899, came right along following that, as follows:

> "Improving Chicago River, in Illionis: Survey and estimate of cost for a channel 21 feet deep from its mouth to the stockyards"—

that is, the Chicago River—

> "To the stockyards on the South Branch, and to Belmont Ave., on the North Branch, so far as may be permitted by existing docks and wharves, exclusive of cost

of removing or constructing bridges or piers or lowering tunnels; and the aforesaid depth of twenty-one feet is hereby adopted as the project depth for the improvement in lieu of that fixed by the Act of June third, eighteen hundred and ninety-six: Provided That all the work of removing and reconstructing bridges and piers and lowering tunnels necessary to permit a practicable channel with said depth to be obtained shall be done, or caused to be done, by the City of Chicago without expense to the United States."

Mr. Justice Holmes: What page is that?

Mr. Adcock: This is page 107 of our reply brief.

Now, it was held in the *West Chicago Street Ry.* case that I have just mentioned, where the suit was brought by the people to remove the tunnels, that the consent of the Secretary of War to the removal of the tunnels was unnecessary, because Congress had meant to give its assent by this act.

Now, the proviso refers to tunnels, or one of the things referred to is tunnels. It was also necessary, as stated in the proviso, to reconstruct bridges; necessary to excavate about 21 feet, and to widen the rivers, in order to make the channel correspond to the greater depth.

And when the work was done, that is our work, in the South Branch (indicating on map) and in the West Fork (indicating), where we deepened the river to twenty-six feet and widened it and changed the bridges—it was all under the authority—or, at least, not necessarily express authority, but certainly with the cooperation of the Federal Government; because they had laid out the project for that depth; we did the work and spent the money, over $10,000,000, and connected that work with their improvement in the Chicago River. They made no expenditures, or made no improvements in the South Branch or the West Fork. The only improvement made by the Government, which was done as we excavated in the South Branch of the West Fork, was in the main river itself, and in the North branch. So that the im-

provements by the Sanitary District of Chicago connected up; and they connected up with the Government work, forming a through connection through the South Branch, the West Fork, and the main channel down to Joliet, and on the old Illinois and Michigan Canal, through the Illinois River, to the Gulf of Mexico.

So that our channels and the work that we did was certainly under those circumstances invited by the Federal Government.

And that was the very act—this item that I have read was contained in the Rivers and Harbors Appropriation Bill which contains this section 10 that we speak of.

Now, is it not reasonable to assume that this great work having been completed at that time, and that act passed, that if it had been intended that the amount of water that Chicago should divert for these purposes should be curbed, then some express words would have been used?

Now, going on, there have been some acts which provide for surveys of this water route. And in one of them, that of June 6, 1900, we find this language, which I think is very important, that a board of engineers should be appointed to make a survey of a waterway and report the estimate of cost for a channel ten feet deep, and for a channel twelve feet deep, and for a channel fourteen feet deep, "through said proposed route, and that the said estimates cover and include a proper connection at Lockport with the Sanitary and Ship Canal which has been constructed by the Sanitary District of Chicago."

In other words, with the idea of connecting right up with that.

Now, there are many other acts, which are set forth in our briefs, passed almost every year, providing for these surveys, providing for reports as to the construction of compensating works in the various river outlets of the Great Lakes, in order to offset for any claimed damage to commerce, or offset for

the lowering of the levels of the Lakes. All of those were provided for.

And we come further to the act of June 29, 1906, for the preservation of Niagara Falls; and I would like just for a few moments to draw your attention to that, because I think it is important. That act provided—it is found at page 51 of my brief:

> "That the diversion of water from Niagara River or its tributaries, in the State of New York, is hereby prohibited, except with the consent of the Secretary of War as hereinafter authorized in section two of this Act: Provided, that this prohibition shall not be interpreted as forbidding the diversion of the waters of the Great Lakes or of Niagara River for sanitary or domestic purposes, or for navigation, the amount of which may be fixed from time to time by the Congress of the United States or by the Secretary of War of the United States under its direction."

In other words, we have there an act of Congress which expressly, it seems to me, states that Congress had not then authorized the Secretary of War to regulate diversions. If it had, there would have been no occasion for the passage of that act, because the Secretary of War could have stopped the diversions, as Congress intended that he should under that act at Niagara Falls. And up to that time the diversions at Niagara Falls for water power purposes, for the making of electricity, existed solely and only under the authority of the State of New York. They were in no different position than the diversion here for sanitary and waterway purposes at Chicago. They existed under the police power of the State, and under that alone.

And in the conference report, when there was an amendment that had been introduced, the late Senator Lodge, in discussing an amendment that Senator Hopkins of Illinois had offered, said:

> "The first section of the bill protects the rights of Chicago. No treaty would be made by our commissions which would impair or infringe those rights."

In other words, even in an act which only related to the Niagara River in New York, Congress was so careful that that should not by any possibility be construed to cover diversions for sanitary and domestic purposes, that it put in the provision that the act did not give the Secretary of War any authority, but those things might be taken care of by Congress later.

I wonder just how much time I have left, if your Honor please?

The Chief Justice: You have, I should say, about ten minutes left of your two hours.

Mr. Adcock: Yes. The importance of these acts that I have just mentioned, running over this period of years, shows that there was an intention on the part of Congress to provide means by which this diversion would exist.

Under the act of June 25, 1910, a board of engineers was appointed to report upon a waterway from the Great Lakes to the Gulf—

The Chief Justice (Interposing): Yes; that is just what you have consumed now, an hour and fifty minutes.

Mr. Adcock: Yes, thank you. (Continuing): To report upon compensating works to offset for the diversions for water power purposes and for other purposes.

That is, they were to make a report on the waterway from Lockport to Utica; and they were also to report upon the means by which the levels of the Lake, or the lowering of the lake levels, could be offset by the construction of compensating works in these outlets, not only for waterway purposes, but for other purposes. And they made their report. And they found in that report that, by building contracting works in the St. Clair River and the Niagara River, the channels of these rivers could be so contracted that the lake levels could be restored to the conditions in which they would be if the diversions did not exist.

On June 30, 1917, Congress by joint resolution again provided for a survey as to means of taking care of all diversions. This is not the only diversion from the Great Lakes. There are some 112,000 cubic feet per second of diversion for water power purposes. There are only 2,300 cubic feet for navigation purposes. The Niagara diversions are for power purposes. There are diversions through the Welland Canal of 3,500 seconds feet, 2,400 seconds feet for power and only 1,100 feet for navigation. Through the Barge Canal there are diversions for power and navigation purposes. And at St. Mary's River, practically the entire flow of that river is used for water power.

Mr. Justice Sutherland: The water is all returned to the stream, is it not?

Mr. Adcock: Yes; but at Niagara Falls there is an effect upon Lake Erie; and also by virtue of the Welland Canal diversion, and as I understand it, the diversion by means of the Barge Canal—

Mr. Justice McReynolds (Interposing): What is the Barge Canal?

Mr. Adcock: It extends from Buffalo across to Albany; it is the New York Barge Canal, as I understand it.

Mr. Justice McReynolds: Oh.

Mr. Adcock: Does that place it in your mind?

Mr. Justice McReynolds: You mean the Erie Canal?

Mr. Adcock: Well, it is the old Erie Canal, yes, sir. It has just been constructed.

Mention has been made of the navigation features of the Sanitary District. These works that have been constructed will provide a waterway to the Gulf of Mexico with a depth of nine feet. They will provide water in the Illinois River, so that there will be a greater depth. We have a water communication twenty-six feet deep—the United States has, from Lake Michigan, clear to Joliet, across the most expensive cut.

And from a sanitary standpoint, the diversion of this water has accomplished a great deal. The death rate from typhoid fever prior to the opening of the canal has sometimes been as high as 170 per 100,000 of population. That has been entirely cut down. There are no epidemics now; and for the ten years since the building of the canal the mean average per year has been in the neighborhood of 7.6 per 100,000 of population. That has been reduced so that in 1923 it was about one per 100,000 of population—a decrease greater than for any other city similar situated. Of course, it is not assumed that the entire result was due to this drainage canal.

Mr. Justice McReynolds: Suppose all of that is true, what good does that do us?

Mr. Adcock: It just shows the necessity for this diversion.

Mr. Justice McReynolds: Well, you might show the same thing about inoculation; and I was just wondering how that would help us in deciding this case.

Mr. Adcock: Now, the propositions which I sought to show here, but which I am not even able to cover in the oral argument, but which I think are covered in our briefs, are these:

This diversion of water has been authorized by the act of March 2, 1827, so that it is affirmatively authorized by law; Congress. And it has been affirmatively authorized by law; because section 10 of the 1890 act, instead of containing the words "affirmatively authorized by Congress," contains the words "affirmatively authorized by law"; and in the case of *Bellingham Bay Boom Co.*, it was held that that meant a State act.

Mr. Justice Holmes: What was that last act that you cited?

Mr. Adcock: That was the act of September 19, 1890.

Now, assuming that section 10 authorizes the Secretary of War to act with reference to this diversion—we will concede it does, so far as the diversion affects the Chicago River:

We contend that we have fulfilled every condition of the permits that have been given by the Secretary of War. That is, we have so reconstructed river so that there is no injury to navigation. There is no current. The Government has never complained in that respect.

That under the July 11, 1900, permits, for the excavation of those rivers, which permits were given for that purpose, the only purpose of excavating was to provide this larger diversion, so that we could take the amount of water required by our act through the rivers; and we contend that necessarily, when the Secretary of War, upon the recommendation of the Chief of Engineers, authorized the doing of that work, he gave authority for the altering or modifying of the navigable waters of the United States, not only in the Chicago River, but wherever located, and strictly in accordance with the provisions of section 10 of that act; that is, laying aside all questions as to the provisions of the act of March 2, 1827, as to the limitations of our law, and as to the authority under the reserved power of the States, the Congress of the United States has invited the construction of these works.

And there is no evidence in the record,—as stated by Mr. Justice Holmes in the case of *Missouri* v. *Illinois*, all the evidence of the Government in this case for an injunction is based upon an inference of the unseen; there is no evidence that the levels of the lakes have been affected or lowered, or that there has been an injury or damage to commerce.

Now, it does not make any difference what legal right the Government has here, there cannot be an injunction which will take effect immediately and without condition. Because it would create an intolerable situation at Chicago. The people, the appellant, the municipalities within appellant's district, that is, the City of Chicago and all the other municipalities taking water from Lake Michigan depending upon these

diversion works for their pure water supply, must have time in which to readjust themselves.

The Chief Justice: What is the exact order?

Mr. Adcock: That the appellant be enjoined from diverting or abstracting from Lake Michigan any water in excess of 4,167 cubic seconds feet.

The Chief Justice: And how much are you taking now?

Mr. Adcock: Ten thousand seconds feet. It is perfectly obvious that if it was cut down to 4,167 second feet there would be no water for the oxidation of sewage. The drainage run-off the Chicago River is 10,000 cubic seconds feet. That is the maximum run-off of the Chicago drainage area, being that amount, would cause the Chicago River to go into Lake Michigan a number of times a year, and carry with it the drainage and sewage, if this diversion were kept within that amount.

The Chief Justice: Well, you concede, then, that you have no express authority from the Secretary of War beyond the 4,167 feet?

Mr. Adcock: No. We claim that we had express authority. If you want to look, the authority exists under the July 11, 1900 permits—well, I want to say that perhaps I did not quite understand the Chief Justice's question. That is, we have not any express authority stating 10,000 seconds feet, or any amount over 4,167 seconds feet. The only authority we have is the authority under the original permit—that is, so far as permits go—from the Secretary of War. And we have fulfilled all the conditions of those permits. That is, the only condition that he placed in the permit was the current in the Chicago River. And we have done the things in the channel of the Chicago River that were necessary to remove any current that would exist by virtue of taking 10,000 cubic seconds feet through those channels. So that, so far as that permit is concerned, we have complied with it.

We have done the work in the deepening and widening of the rivers under the permits of July 11, 1900. And that was the only work that was necessary in order to take our water through there. We had to do it; and unless we did that work we could not get the water through. And it was the purpose of the work; and having given us authority to do the work, he necessarily gave us the authority to do those things which would result from the work.

Mr. Justice Butler: How many intakes are there?

Mr. Adcock: There is a channel here (indicating on map) at the northern end, north of Chicago, at Wilmette, which connects with the North Branch of the Chicago River. Then there is the Chicago River itself. And there is a conduit at 39th Street, which picks up, by intercepting the sewage along the shore 2,000 feet; and then there is this Calumet Sag Channel (indicating).

Mr. Justice Butler: That is four, is it?

Mr. Adcock: No, that is 6,500 coming through the main river—

Mr. Justice Butler (Interposing): No; I mean four intakes?

Mr. Adcock: There are five.

Mr. Justice Butler: And one under construction further north?

Mr. Adcock: No; there are none under construction now.

Mr. Justice Butler: You have completed all of them?

Mr. Adcock: We have completed our diversion works.

Now, we have a plan or provision made for taking care of the sewage that will not be oxidized by this 10,000 seconds feet. But the basis of the whole thing, of the whole proposition, is the diversion from Lake Michigan of 10,000 seconds feet, in order to keep the Chicago River and all its branches supplied with sufficient water for those purposes.

Mr. Justice Brandeis: What other means have you adopted to take care of the sewage?

Mr. Adcock: We have put in sewage purification works to supplement that diversion; but they are only supplemental.

Mr. Justice Brandeis: Where are they?

Mr. Adcock: Those are the various projects that are laid out (indicating on map); and it is shown in the testimony—

Mr. Justice Brandeis (Interposing): What proportion of the present sewage of the city will be taken care of by those works?

Mr. Adcock: Those works will be installed by 1945, under an ordinance adopted August 7, 1919; and that ordinance was passed in cooperation with the United States Engineer at Chicago, and it is to take care of the increase of the population in that period.

Mr. Justice Brandeis: In the next twenty-one years?

Mr. Adcock: In the next twenty-one years; and also the waste, etc., that now overloads the channel.

Mr. Justice Brandeis: Is there at present an overload?

Mr. Adcock: Yes, sir.

Mr. Justice Brandeis: How much is the overload, in comparison with the capacity of the channel?

Mr. Adcock: Well, it creates a condition in the Illinois River that is bad. It is due principally to trade wastes that have to be taken care of.

Mr. Justice Brandeis: How large is that overload, estimated in percentage?

Mr. Adcock: About fifty per cent. It represents all the sewage of about a million and a half people.

Mr. Justice Brandeis: And is it the impossibility of producing these supplemental works before the end of twenty-one years that leads to their being deferred until 1945?

Mr. Adcock: No. In order to work out this project—the art of sewage disposal, if you can call it an art, has been in a state of flux or change for a great many years; and one method would be adopted, only to be thrown away for some other method; and it has required—

The Chief Justice (Interposing): In the meantime, you have opened the exit from Lake Michigan?

Mr. Adcock: Yes; but the studies of these methods have been going on all the time, and it has been assumed—

The Chief Justice (Interposing): It has been done on the theory that you needed the water?

Mr. Adcock: On the theory that we had to have the water, and that it is absolutely necessary for the disposal of the sewage.

(Thereupon, at 4:30 o'clock p. m., the Court adjourned until Tuesday, December 9, 1924, at 12:00 o'clock noon.)

SECOND DAY.

Washington, D. C.,
Tuesday, Dec. 9, 1924.

The above-entitled cause came on, for further oral argument, before the full Court, at 12:00 o'clock noon.

Appearances as heretofore noted.

Oral argument of Daniel N. Kirby, Esq., amicus curia, in favor of appellant.

Mr. Kirby: May it please the Court: On behalf of my associate, Mr. Lynde of Chicago and myself, I desire to express our appreciation of the courtesy of the Court in permitting us to participate, and of the courtesy of the parties to the record in consenting.

We are here representing the States of Illinois, Missouri, Tennessee and Louisiana; also various chambers of commerce and boards of trade in the cities of Chicago, St. Louis, Memphis and New Orleans. We also represent the Mississippi Valley Association, an organization whose membership includes shippers, persons interested in navigation, extending from St. Paul to New Orleans, and who therefore, in their interests, represent the whole of the Mississippi Valley. So it may fairly be said that we represent the people and commerce of the Mississippi Valley.

The Mississippi Valley is interested in this decree and in its effect, from two points of view, and for two reasons: *First*, in respect of navigation in the Mississippi Valley; and *second*, the question of sanitation as affecting the State of Missouri, particularly, and the State of Illinois directly.

As to navigation, the primary interest of all of the Mississippi Valley is, of course, for the improvement and the direct use of the Mississippi River and of this historic highway from the Lakes to the Gulf, for the purposes of navigation and commerce.

This decree, we submit, will prejudice the navigability of the Mississippi River itself, if it should be put into effect. The extent to which the navigability of the Mississippi River is prejudiced will appear from the fact that the low water flow of the Mississippi River at St. Louis—and low water time is the critical period of navigation of the Mississippi River—the total flow is only 33,000 cubic feet per second, including this 10,000 cubic feet which is obtained from Lake Michigan.

Now, if this decree goes into effect and more than half of that added water taken from Lake Michigan should be taken out of the Mississippi River, the effect upon navigation between St. Louis and Cairo, Illinois, which is the critical part of the river, will be seriously impaired.

The navigability of the Mississippi River and the supply of water for navigation in that stream has become lessened through the effect of the drainage of swamps in the sources of the tributaries of the river in the far north; so that the critical time in the navigation of the river is becoming more and more a problem of difficulty to the engineering department of the United States.

The secondary interest that these Mississippi Valley States have in this question of navigation is due to the fact that, because of the revived interest in navigability of the Mississippi River due to the Government's cooperation since the war in creating and operating a barge line from St. Louis to New Orleans, which carries vast quantities of freight now between those two points; a single barge load of grain carrying as much grain from St. Paul to the Gulf as a whole trainload of freight cars. It has revived interest of the whole Mississippi Valley in the navigability of the inland waters and in the promotion and further carrying out of the project, which has been under contemplation and consideration by the Government for many decades, and that is the project for a deep waterway from the lakes to the Gulf.

Now, the existence of an available, an actual, route by water, not only from the cities and towns immediately upon the Mississippi River and its tributaries that are navigable, but available for part rail and part water routes, extends the influence of this decision not only to the immediate Mississippi Valley and to its navigable tributaries, but all over the West, so far as the rail lines reach, over which, in conjunction with this water route, there are available combination rail and water rates, and the existence of this available water route from St. Louis, or from a point higher on the Mississippi, to the Gulf at this time has the effect of a leveling and lowering influence upon the rail rates to the Coast from all of these shipping points in this vast territory that may be called the "Mississippi Valley freight territory,"

and the trade territory tributary to the Mississippi Valley itself.

So that, in respect of navigation, these States and people are vitally interested in the question whether the navigability of the Mississippi River and of this proposed waterway and of this historic waterway between the Lakes and the Gulf, is going to be seriously impaired by the effect of this decree.

Next, the State of Illinois, in respect of sanitation, is directly interested, because this record shows that, if the flow, taking into consideration the increased population of Chicago and the increase in its surface waters and sewage—because of the increase in population and industrial consumption and use of water, which tends to poison it—if that flow of 10,000 cubic feet per second be cut down more than one-half, as this decree would do, why, then, the record shows that a condition of very grave menace to the health of the people of Chicago, and all the communities along the canal, the DesPlaines and Illinois Rivers, will be seriously threatened.

Of course, we in Missouri, and in St. Louis particularly, under the decision of this Court in *Missouri* v. *Illinois*—if we must fall heir to the sewage of Chicago in our drinking water, we are vitally interested in the question of sanitation, to the extent that the water that comes from Lake Michigan shall be adequate to safely dilute that sewage so that it will not be a menace to the health of the people of St. Louis.

The States lower on the Mississippi River are not immediately interested in that question of sanitation, because, by processes of nature, the water probably becomes purified.

With these interests and these peoples, and this vast extent of territory to be prejudiced by this decree if enforced, we have examined this record, and we respectfully submit that it presents a very narrow issue, as a matter of law. This

is not a suit by the Government to abate a public nuisance. It is not a suit by the Lake States, or any of them, complaining that the State of Illinois, as part owner of the waters of Lake Michigan, is making an unfair, unjust or inequitable use of those waters, to the prejudice of the Lake States.

Nor is it a suit by the Government of the United States, based on the general ground that the State of Illinois is making an undue or unreasonable use of navigable waters within its own borders.

The sole basis of these bills, your Honor, is that they rest upon the charge and the legal theory that any diversion of waters from Lake Michigan by the State of Illinois is unlawful, unless it be authorized by the Federal consents prescribed by section 10 of the Rivers and Harbors Act of 1899.

Now, that obviously brings before this Court, as the first question for legal consideration, the very important question of the sovereign power of the United States, and of Illinois, in respect of what Illinois has done in relation to navigable waters within her borders. Because it should be remembered that even Lake Michigan is wholly within the United States. No part of Canada borders on Lake Michigan; that all of the work that Illinois did, either directly through its own State expenditures of money, or through this subordinate agent of Illinois, has been done upon the navigable waters of the United States, wholly within the borders of the State of Illinois. That is, the work directly affecting waters of the United States within the borders of the State of Illinois.

Now, if the Court please, Mr. Adcock did not have time yesterday to state *seriatim* to the Court the legal propositions on which the Sanitary District and the State of Illinois, and this side of this great controversy, rest in this case. And they have asked me if I would read to the Court, or state to the Court, *seriatim*, what those propositions are, so that before the Government counsel make their arguments, the Court will have before it, in a connected and complete form

what these legal questions are, and what the contentions are; and to the extent that my time permits, I shall endeavor to deal with one or two of what I regard as the more important of these questions.

> "Proposition 1: The action of Illinois in providing for the diversion of water for navigation and sanitary purposes was valid, in the absence of any Congressional action."

In other words, our contention is that this case falls within the class of cases designated by this Court in many of its decisions as of the concurrent jurisdiction class, rather than within the class of cases wherein the legislative jurisdiction is exclusively vested in Congress.

In other words, until Congress acts, under the decisions of this Court in the concurrent jurisdiction class of cases, we understand the law to be firmly established that the State is free to exercise its sovereign power to use navigable waters within its borders, by bridging them; by building dams in them; by appropriating and diverting those waters for the public benefit of the people of the State; unless and until Congress shall step in with its superior power and interfere or regulate what the State has thus attempted to do, in the absence of Congressional action.

> "Proposition 2: Upon the entrance of Illinois into the Union, Congress recognized Illinois' authority to divert the waters and invited it to divert the waters."

Mr. Justice Sutherland: Will you not read that again, Mr. Kirby?

Mr. Kirby: Yes, your Honor:

> "Upon the entrance of Illinois into the Union, Congress recognized the authority of Illinois—"

Meaning its State sovereign authority—

> "to divert the waters of Lake Michigan into the Mississippi watershed, and it invited Illinois to do so."

This contention is based, *first,* upon what Mr. Adcock read to your Honors yesterday as to what happened in Congress when Illinois was admitted.

The resolution in its original form for the admission of Illinois into the Union did not contemplate including within the borders of Illinois any of Lake Michigan. But upon the floor of Congress an amendment was offered on the same day that the act of admission was passed; the effect of that amendment being, so far as this case is concerned, that in order to invite the attention of this new State just being admitted into the Union to the desirability of opening a waterway to connect the water of Lake Michigan with those of the Illinois River, it would be well to give Illinois as a part of her territory some of Lake Michigan; and that was done; the amendment became a part of the act of admission.

So that when Congress took the State into the Union, there was that invitation to look into this matter of the waterway; an invitation to the State to exercise its sovereign power in that regard.

Again, in 1822—Mr. Adcock read to your Honors the act by which at that time Congress more definitely expressed the same desire; because then it made a grant of land to the State of Illinois for the purpose of assisting the State in opening this very canal, the stated purpose of which was to unite the water of Lake Michigan with those of the Illinois River.

And again, the act of 1822 having become void because Illinois could not carry it out, the act of 1827 was passed, expressly in terms for the purpose of aiding the State of Illinois to unite the waters of Lake Michigan with those of the Illinois River.

And what did that mean, your Honors? What was necessarily implied in that? It was the recognition by Congress, we submit, of the fact that Illinois had sovereign authority as a sovereign State to act in respect of navigable waters

within its own borders, unless and until Congress should interfere. And in aid of that State power, Congress said in this act of 1827:

> "We will give you land that you can sell for the purpose of enabling you to carry out this State work and this State plan, which we invite you to engage upon involving these waters."

What would a Union of those two bodies be? Necessarily, it meant a diversion of water from Lake Michigan into the Gulf of Mexico, because the Gulf was lower in level than Lake Michigan.

The Chief Justice: Do you think Congress would have the power to delegate or give away its control of navigation, by legislation which should bind Congress not to restrict the taking of water which might interfere with navigation?

Mr. Kirby: No, your Honor, I do not think Congress could give away the power granted it by the Constitution under the Commerce Clause.

The Chief Justice: And if not, then the arguments here are only arguments with reference to its purpose, and therefore, there is nothing to prevent Congress from restricting it. Now, Congress has restricted it, has it not, in section 10 and section 12 of the act?

Mr. Kirby: We think not your Honor. We do not think that section 10 or section 12 of this act intended at all to delegate from Congress to the Secretary of War, especially when the Secretary of War could act only on the recommendation of the Chief of Engineers, the broad power to say that a diversion of Lake Michigan might be made into some other watershed. Congress never intended to delegate any such power. We think there are powers delegated there, and that they are powers appropriate to be delegated, and that they have delegated them in a constitutional manner. But we think that if the act is sought to be interpreted as making a wide delegation of power on questions of public policy, as

the question of your Honor intimates, such a delegation would have been unconstitutional, because Congress did not attempt to prescribe any general principles, or any rules subject to which the Secretary of War should determine the questions—the very questions affecting the public policy and the international controversies that might follow from the delegation and the exercise by a delegated administrative officer of such broad legislative powers as those involved. We think that section 10 has a very useful and a very wide scope. And I shall not have time to discuss it more, because I would like, if the Court will permit me, to cover these points in this statement.

The Chief Justice: Go right ahead.

Mr. Kirby: But that is our attitude about section 10 of the act.

The next proposition is—

> "That Congress has continually cooperated with Illinois over the long period of years since the 1827 act was passed; and it has never yet indicated its disapproval of this diversion, and has never yet attempted to either stop this diversion or to regulate it."

The next proposition is—

> "The Congress, by its attitude and action, has approved what Illinois has done in opening this canal and conducting this diversion of water from Lake Michigan, by repeatedly appropriating and expending money to help complete the work in the Chicago River and connect with appellant's channels."

In the decision of this Court in *Chicago Street Ry. Co.* v. *People*, in 201 U. S., it was held that the work thus provided for could have been completed and carried out without the permit. And that was the ruling of this Court.

In other words, there exists in this case a direct assent or consent of Congress itself, this Court held in that *Street Railway* case in Chicago, the subject of which was the lower-

ing of some tunnels that ran under the Chicago River and were used for street railway purposes; and in that case the permit of the Secretary of War had not been obtained for the doing of the work—this Court held that it was not necessary, because the consent of the Congress had been directly given for the doing of that work, and all that was reasonably to be implied from that consent went with the consent.

Mr. Justice Holmes: I remember a case of that kind, but I do not know the citation.

Mr. Kirby: That is in 201 U. S.

Mr. Justice McKenna: You did not give the page?

Mr. Kirby: No, I did not. I have not the page here.

My next contention is:

> "That section 10 of the Rivers and Harbors act of 1899, which is the act on which these bills are founded, cannot be construed to delegate to the Chief of Engineers and the Secretary of War authority to fix the quantity of water that may be diverted."

In other words, if the Sanitary District now went to the Secretary of War and the Chief of Engineers with a new proposal to divert from Lake Michigan through a small river into the Mississippi Valley, the contention is that the Secretary of War was not intended by Congress to have the power to determine whether a diversion could or could not be made, his power being limited to certain administrative features relating to the method in which the work could be done; and that that construction of the act appears more strongly from the fact that the approval of the thing through the Secretary of War must originate with the Chief of Engineers; that what Congress had in mind was that any work proposed to be done which would affect the navigable capacity of the waters of the United States should be so done, as to its manner of construction and the laying out of the work, and all of the engineering features affecting the method of doing that work,

as would be in harmony with the policy and plans of the engineering department in respect of the navigable waters of the United States and their improvement and whether the proposed work would prejudice their navigability. In other words, that the proper construction, and the only lawful construction, the only constitutional construction that may be given to section 10 of the act is that it is administrative in nature and narrow in scope, for the purpose of protecting the engineering features of work which is to be done.

Mr. Justice Sanford: Would you say that they could not provide for the limiting of the amount of water taken, in so far as it affected the navigability of the river by the Secretary of War?

Mr. Kirby: Certainly; but not to determine the broad question.

Mr. Justice Sanford: And that these permits were strictly in exercising that power?

Mr. Kirby: Certainly, that is it; that is a matter affecting the engineering features.

Mr. Justice Brandeis: Why is not the navigability of the lake and of the harbors at the lake ports also an administrative question?

Mr. Kirby: I think it would be, your Honor, so far as the channels into the lake are concerned.

Mr. Justice Brandeis: Well, according to the testimony, the depth of the harbors was affected by this diversion?

Mr. Kirby: But the United States itself did the work of the deepening of those harbors, so as to cooperate with this diversion of waters.

Mr. Justice Brandeis: Well, then, why should not the amount of the deepening necessary to preserve navigation be a matter which the Secretary of War could determine?

Mr. Kirby: I think the matter of the deepening of the channel itself would be a matter that would properly fall under the jurisdiction of the Secretary of War and the Chief of Engineers. But the fundamental question whether Illinois is to be allowed to divert or not is a different question—

Mr. Justice Brandeis (Interposing): No,—how much; not whether it can take, but how much is proposed to be taken?

Mr. Kirby: Yes. But in the act of 1827, in which there was no limit of the amount of water that was to be diverted in order to accomplish this union of the waters of Lake Michigan with those of the Illinois River—what is the reasonable construction that the parties themselves have put upon the depths and the effect of the development of navigability of those waterways? The diversion by the State of Illinois actually began in 1848. There was diversion then, but it was under gravity flow, and gravity flow could not accomplish the purpose, because there was no cut through the divide; the cut was not deep enough.

In 1871, they cut the channel deeper, from 1871 on, with never a protest from Congress, with never an objection from Congress to the continuation of such diversion, Illinois has continued, either directly or through this Sanitary District, to divert water—what quantity? Such quantity as Illinois, under its own statutes, declared to be reasonable and necessary. For what purposes? For two purposes: *First*, for sanitation, which was an entirely proper subject for Illinois to use these waters for—for protecting the health of its own people.

And *second*, for navigation. And navigation was not a mere incidental, because what money that Illinois spent and the work it did was in harmony with the very plans and projects of the engineering department for the development of this deep waterway proposed to be built between Chicago and the Mississippi River.

Mr. Justice Brandeis: What was the largest diversion up to the time when this 4,000 feet was authorized?

Mr. Kirby: 60,000 cubic feet per minute. That is all that the old Illinois and Michigan canal would take, as I understand it. The cut through the divide would only permit that much. That quantity—while that began in 1871, when the deep cut was first made, it diminished, through the gradual decrease of the water supply and the lowering of the level of the Lakes that occurred about that time; there is no charge that it was due to this diversion.

But this whole present diversion we claim is a lawful diversion, and a continuation of the diversion of the old Illinois and Michigan canal, and not, as the Government claims, a new diversion beginning with the present ship canal. This entire diversion began in a small way. Chicago was small. The needs of navigation were small. As the States grew and as the needs grew, they had to increase it for both purposes; there is no doubt about that. It might be conceded that sanitation was the primary purpose, but it was a lawful purpose.

The Chief Justice: Do you mean it was the primary purpose of the act of 1827?

Mr. Kirby: Oh, no, your Honor.

The Chief Justice: Well, is there anything in that act that indicates that sanitation was any purpose?

Mr. Kirby: No, your Honor; we suppose that Congress would have no power to grant for sanitation purposes to the State.

The Chief Justice: Well, but it has power to give permission for changing the level of the Lake?

Mr. Kirby: Yes, sir.

The Chief Justice: And if that was for sanitation, then I should say that the power to restrict would follow, in the interest of navigation?

Mr. Kirby: Obviously, the act of 1827 could deal only with such power as Congress had under the Commerce Clause, and that related to navigation.

The Chief Justice: Well, it has control over navigation; and the right to control navigation can be exercised by restricting the use for sanitation, or granting the use for sanitation?

Mr. Kirby: If the use for sanitation prejudices navigability, yes, your Honor. There is no charge of that kind in this case. This case rests entirely on the proposition that in lowering the Lake levels—that any diversion of water from Lake Michigan will necessarily lower the lake levels.

The Chief Justice: Well, it may.

Mr. Kirby: Yes; it will, appreciably.

The Chief Justice: Well, even though it affects sanitation, it affects navigation, and brings it within the power of Congress, does it not?

Mr. Kirby: Yes; but our contention is that Congress has expressly assented to that use of the waters of Lake Michigan.

The Chief Justice: In what way?

Mr. Kirby: By this act of 1827, for the purposes of navigation it has permitted the diversion. It wanted to unite those two bodies of water—to divert enough water from Lake Michigan to create a waterway available to meet the needs of the growing communities that might call upon it for use as the country develops. And Congress has never interfered with that, unless this Court shall construe this section 10 of the act of 1899 as intended to be an interference.

Mr. Justice Sanford: Do you mean to say that you are only removing so much as is necessary for navigation, and not for other purposes?

Mr. Kirby: Well, I will not say that, your Honor.

Mr. Justice Sanford: Then that consent will only extend to that which you are authorized to do, and for the purpose for which you are authorized to do it?

Mr. Kirby: Very true.

Mr. Justice Sanford: Now, if there is more than that done, how does it come under the consent?

Mr. Kirby: It does not come under the consent, except to this extent: That Congress knew perfectly well, and it is indisputable from the evidence in this case that it knew perfectly well, that Illinois, in its own sovereign power, was proposing to use it for the other purpose as well; and it has never interfered; but that on the contrary Congress was, in the act of 1827, and by a consistent course of conduct ever since, cooperating with the State of Illinois, by making repeated appropriations, the effect of which contemplated the continuance of this diversion of water by Illinois.

The Chief Justice: Although the consent had been refused, so far as the Executive was concerned?

Mr. Kirby: Yes, sir; but we had authority direct from Congress to make a diversion adequate to meet the needs of commerce, for the purposes of that canal.

When the act of 1899 was passed by Congress, may it please your Honors, Congress knew full well the full details of this project. They had before them the report of the Chief of Engineers showing exactly the quantity of water proposed to be diverted through this channel, 10,000 cubic feet of water per second. They knew the provisions of the Illinois act regulating the amount that Illinois was directing its subordinate to take out of Lake Michigan for the purposes of sanitation and navigation. And Congress has never acted since then to say that Illinois was prejudicing navigation—unless such action can be found in section 10 of this act.

Now, we think it important to keep in mind this distinction: That until Congress acted, Illinois had a right as a sovereign

to use those waters for sanitation; and all that it needed for sanitation, subject always to the superior power of Congress to interfere if it prejudiced the navigability.

In other words, while we are in a perfect position to say that the act of 1827 gave this consent of Congress, we are also in a position to say, under the doctrines of this Court in the concurrent jurisdiction class of cases, that, without the consent of Congress, or until Congress interfered to prevent, the State of Illinois, under its sovereign power could take as much water as it reasonably needed for such purposes as the State deems necessary. And the fact that these waters were partly within the borders of other States, and that to some extent this diversion might affect a foreign government, did not affect the right of the State—Congress' power being dormant—to deal with these waters as it pleased —subject always to the right of Congress to step in and say, "No."

The Chief Justice: You are now using extra time. You have consumed about thirty-seven minutes.

Mr. Kirby: My time was thirty minutes. I beg the Court's pardon.

The Chief Justice: Before you go, have you stated all of the legal propositions that you were reading?

Mr. Kirby: No, your Honor, I have not. But that is our misfortune.

Mr. Adcock: Go ahead and read them.

Mr. Justice Holmes: Will you tell me before you finish this: Is there somewhere in the briefs where those propositions are summed up that you can refer us to?

Mr. Kirby: I am afraid they are not summed up in this way in any of the briefs. It is a work that was done last night, for the purpose of condensing them.

The Chief Justice: Your associate says you can go ahead. Your side has the time.

Mr. Kirby: Thank your Honor. I will then read them without attempting to expound them.

Mr. Justice Holmes: I believe you had got through the fifth proposition.

Mr. Kirby: I think so, your Honor.

I am asked to say, in connection with what I have stated to the Court, that as late as 1904, after the act of 1899 had gone into effect, and after this present Sanitary and Ship Canal had been operating for four years, Congress, in one of the Rivers and Harbors Acts, granted consent to the State of Illinois to remove some of the obstructions in the Illinois River, the purpose of that grant being to stimulate and enlarge the flow of the Illinois River so as to exclude this diversion from Lake Michigan which was then being made.

And Mr. Adcock's brief in this case contains numerous instances in which Congress took action—not action indicating a hostile attitude towards the continuance of this diversion, but on the contrary, spending money and doing things which indicated a cooperative attitude by Congress with this continued diversion that Illinois was making, and with full knowledge on the part of Congress that Illinois was doing it for the purpose of sanitation, as well as for the purpose of navigation.

And now, I shall read the rest of the propositions:

"Proposition 5. Congress, by numerous acts providing for surveys and reports as to compensating works and means to offset for theoretical lowering of the level of the lake, has recognized the authority to divert; and if anything was to be done to offset for the effects upon navigation, Congress proposed to provide the works, instead of stopping the diversion.

If Congress had not recognized the authority and the right to diversion, it could easily, by special act, have stopped the diversion, instead of appropriating money to find means to make good what it was permitting us to continue to do.

Proposition 6: Congress has, in the improvements provided for in the Rivers and Harbors acts since appellant's channel has been opened, expressly taken care of any theoretical effect upon navigation.

The actual depths of harbors, are not less than the project depths fixed by Congress; so that actual navigability with respect to the harbors has not been prejudiced.

Proposition 7: The appellee must allege and prove substantial, unreasonable damage to navigation and to commerce. It has not sustained this proposition by proof, either with respect to the lakes, or with respect to the Chicago River.

Proposition 8: By virtue of the preceding acts of Congress, the Secretary of War, under section 10, had nothing to do with the quantity of diversion; and he so construed the situation in his original permit, and did not alter that position until 1913, after the district had made large expenditures carrying out the work contemplated by the original permit.

The jurisdiction of the Secretary was confined to issuing permits upon the recommendation of the Chief of Engineers, with reference to the manner of the construction of works in the Chicago River.

All the conditions of these permits have been complied with.

Either the Secretary of War has no jurisdiction over the quantity of the diversion, as we contend, or he has some jurisdiction. If he has jurisdiction, then in authorizing the construction of work at an expense of over $10,000,000, he exercised that authority and authorized the result of the work.

Proposition 9: The question before the Court is not whether there is a permit to flow 10,000 cubic seconds feet, but whether an existing work, through which flows that quantity, unreasonably interferes with the navigation of the river.

The proof is conclusive that there is no current in the Chicago River unreasonably obstructive to navigation; and as an instrumentality of commerce, it is one thousand fold superior to the river before appellant's expenditures began.

Proposition 10: For the sake of argument, forget all about permits and acts of Congress authorizing the diversion: The question, boiled down, is, Does the existing work protecting the health of Chicago substantially interfere with interstate commerce? If it does not, the works of Illinois being reasonable, any action on the part of the United States or even by Congress, destroying the same would be unreasonable.

Proposition 11: The equitable conscience of this Court cannot destroy $100,000,000 worth of property, and endanger the lives of 3,000,000 people, unless the law of the United States clearly and unmistakably so requires."

To which should be added that the act of 1910 did not intend to stop, regulate or interfere with diversions existing at that ime. It was prospective in its effect and intent, and not retrospective.

Mr. Adcock: You mean the act of 1899.

Mr. Kirby: I mean the act of 1899, under which the suits were brought.

The reference to the *Chicago Street Railway* case, Mr. Justice Holmes, is 201 U. S., 505, at 507.

Mr. Justice Sanford: I would like to ask you one question: In view of these arguments and propositions of law, would you allow that the suit could be maintained if the proofs showed that the diversion created a substantial impairment of commerce in the lakes?

Mr. Kirby: I would not, if a proper suit was brought for that purpose. But that is not this case.

Mr. Justice Sanford: Then you come back to the form of the suit?

Mr. Kirby: Yes, your Honor.

The Chief Justice: If you have not those points shown in your brief, you might make copies of those and hand them to the clerk.

Mr. Kirby: I thank your Honor.

Oral Argument of Hon. James M. Beck, Solicitor General of the United States, on behalf of the appellee, the United States of America.

The Chief Justice: Mr. Beck.

Mr. Beck: If the Court please: I have followed with great interest the first part of my learned brother Kirby's argument, and with great attention also; because in my judgment, its tendency is to sustain the contention of the Government, for the reason that it shows that, while the right of the Government to avail itself of an injunction to vindicate its paramount authority over the navigability of the Great Lakes is a justiciable question; yet the comparative benefits to the Mississippi Valley, or to the Great Lakes region, from the unlawful diversion of water from Lake Michigan is not a justiciable question, but is a political question, and that the forum to determine what shall be done, under a very trying situation, is for Congress and not for this Court.

For it is quite obvious, that this Court not only lacks the power, but lacks the means, to balance what have been called in the appellant's brief the equities of the case between Illinois and the Mississippi Valley and between the Great Lakes regions who, through their spokesmen, will shortly be heard.

Now, this case, notwithstanding a ponderous record and many briefs and the magnitude of the interests involved, seems to me a very simple one. It is like a watermelon, large in bulk but very slight in substance.

The contention upon which my friend based his last remark to the Court was that the form of this action was not to prevent an unlawful impairment of navigation of the Great Lakes, but simply to remove an obstruction in the matter of the Calumet River, and later, of the Chicago River. I shall presently show that that is a gross misconception of the language of the Government's bill.

Mr. Justice Sutherland: Mr. Solicitor General, before you get fairly under way, I would like to ask you this question: Does this narrative statement that has been furnished us by counsel on the other side from your point of view state the case correctly?

Mr. Beck: I think it is substantially correct. In our reply brief we have called attention to some inaccuracies; but we have no objection to the Court assuming its substantial accuracy, except where we have ventured to show that it was in error; and that has not occurred in many places. I have no doubt the narrative statement was prepared in good faith, and is a fair review of the 5,000 pages of testimony.

Now, before I come to the form of the action, I want to explain to the Court a little more in detail the history of these permits. I want to show, by chronological statement of the facts in the case, how far, as intimated by Mr. Kirby, the Government engineers and the officials in Washington have cooperated with the Sanitary District in changing the currents of two rivers and in diverting the waters of Lake Michigan to an amount which, if you estimated it, not in seconds, but in hours, staggers the imagination. I think that, if the Court will patiently follow me in this chronological statement of the official acts done between the United States and the Sanitary District, it will be in very little doubt, if any, with respect to the merits of the contention.

It begins before the Republic began, on July 13, 1787, when the Confederation passed the Northwest Ordinance, in which it was provided that:

> "The navigable waters leading into the Mississippi and the St. Lawrence, and the carrying places between the same, shall be common highways and forever free, as well to the inhabitants of this territory as to the citizens of the United States and those of any other States that may be admitted into the Confederacy, without any tax, impost or duty therefor."

When the Constitution took from the various States the power over interstate commerce, through conflicting regulations and imposed it in the Government they created, and when the first Congress of the United States came to meet, they reenacted this part of the Northwest Ordinance. So that, when the Territory of Illinois was constituted a State, it had, as this Court decided as recently as in the *Economy Light & Power Co. case,* reported in 256 U. S.—it decided that, while the Ordinance of 1787 making these Great Lakes and also the Mississippi River open highways for the benefit of the entire people of the United States—that while those provisions of the Ordinance did not act as limitations upon State authority, as contrasted with the powers which the Original Thirteen States had, yet, they did survive in full force as regulations of interstate commerce and as declarations of the National will with respect thereto.

Now, the next point to be remembered—and I shall refer to it hereafter; and I only refer to it now as indicating what should have been in the minds of the Sanitary District of Chicago when they embarked upon this hazardous experiment—is that, just a century ago, in this Court, in the case of *Gibbons* v. *Ogden,* the plenary power of the United States in respect to interstate commerce was vindicated; and thereafter it became perfectly clear, in a succession of decisions, that while, as to navigable rivers wholly within a State there were still reserved some rights with respect to local facilities and purely police regulations, whose validity would be assumed until Congress declared to the contrary, yet, with respect to interstate navigable rivers or highways, the State had no reserved power with respect to those, and that even if Congress had not acted with respect to interstate highways, yet its very silence and inaction was a declaration that those water highways should flow unvexed to the destination Nature had ordained for them.

Of course, the whole point in *Gibbons* v. *Ogden* was that, although the Hudson River was wholly within the State of New York, nevertheless it was not competent for the State of New York to determine the conditions of its navigability.

Now, that being so, we come to the point—and I shall dismiss it very briefly—we come to the two acts of Congress, of 1822 and 1827. Of the first it is unnecessary to say more than that, Congress having made a donation of land for the construction of a canal upon certain conditions, the conditions were never complied with and the canal was never built under that act.

When, however, Congress in 1827, acting upon a memorial of the people of Illinois, granted certain lands for the purpose of constructing a canal, the dimensions of the canal can be measured by the fact that the memorial which was addressed to Congress and upon which it acted contemplated an expense of $700,000. At all events, that canal is not this canal. And I venture to say that at the time that act was passed by Congress, Chicago was not even in existence, unless it was a trading post, with, possibly, a few houses; but at all events, as a municipality it was not in existence.

And I venture to say that no more untenable proposition has been advanced to this Court—and that is saying a great deal—than the suggestion that an act of Congress granting land in aid of the construction of a canal in 1827, for navigation purposes, before Chicago had any political existence—that that should be regarded, for all future time, as an authority to a city that thereafter came into existence to construct a canal the cost of which they say, with its attendant works, now amounts to $100,000,000—not for the purpose of navigation, but primarily as a common sewer. To say that the construction of a little canal nearly a century ago, for one purpose, is an implied authority for the construction of another canal for an entirely different purpose, is a proposi-

tion that I shall not take the time of the Court to further discuss.

In 1889, the State of Illinois embarked upon this hazardous, and as I fear it may prove, fateful experiment. They created, having had through various commissions examinations made into the subject of what should be done with the sewage of Chicago, which at that time was a city of about a million and a half people—they passed the act which created the Sanitary District, and which made it mandatory for all time for the Sanitary District to take from the waters of Lake Michigan an amount of water proportionate to each 100,000 people of that city. And that in face of the fact that, of course, Chicago was already growing by leaps and bounds.

Now, at that time, it is well to remember, three other great cities had, in the same decade, considered the same problem. London, which has twice the population of Chicago, and Berlin and Paris, which have approximately the same population as Chicago. And every one of them, without in any way diverting the waters of the waterways upon which those cities are located, found a way to dispose of sewage by eliminating the solids from the liquids, then treating the solids chemically, and in that way disposing of it in a way that still maintained the purity of the drinking water and at the same time the health of the people. And to this day the great city of London and the great cities of Paris and Berlin have solved this problem without any such unlawful appropriation of other people's waters as marked the action of the Sanitary District in this case.

However, there was this temptation to the State of Illinois to adopt the method that they were going to adopt, namely: That it was not only a great deal cheaper—because, as Secretary Stimson, I think it was, so well said when he came to dispose of the questions in one of the applications made to him, it was not merely a question of comparative methods of sanitation; it was a question of cost; and it was a great

deal more economical for Chicago to utilize the waters of Lake Michigan to flush a canal that was thenceforth, primarily, at least, a great sewer, than to dispose of its sewage in the approved, modern chemical methods such as were adopted by London, Paris and Berlin.

Moreover, Chicago determined to further reduce the expense of the improvement by constructing great hydroelectric works at Joliet, was it not?

Mr. Fleming: Lockport.

(Mr. Beck (Continuing): Great hydroelectric works at Lockport, to utilize the current thus created by the diversion of waters of Lake Michigan through the canal. And thereby it has maintained a very large electrical producing company, which has furnished the parks and the public buildings of Chicago with light, and has given a great advantage to Chicago by utilizing such power.

It is quite obvious that such power could never have been created had they not forced into this drainage canal this current of 10,000 cubic feet per second. Because, so far as the navigation is concerned, the reports of the engineers are that the diversion of 1,000 cubic feet per second is all that the canal needs for navigation; but that for the purpose of creating a current that would run three miles an hour, it was necessary to divert a much larger volume of water, and thereby create the hydroelectric works which would enable the cheap generation of electricity.

Thereupon the State by legislative act created, as I said, this Sanitary District of Chicago, which is the appellant in the case.

Now, before they had asked for a bid; before a spade had been driven into the ground; before there had been any expense incurred whatever by the City of Chicago, Congress, which up to that time had remained silent on the subject, passed a law which was a plain assumption of full authority

by Congress over the navigable waters and lakes of the country, and likewise included a specific prohibition of the very thing that the Sanitary District was planning. For under the act of September 19, 1890, passed shortly after the Illinois act which created the appellant, it was provided—

> "That the creation of any obstruction, not affirmatively authorized by law, to the navigable capacity of any waters, in respect to which the United States has jurisdiction, is hereby prohibited."

And it is further made unlawful for any one—listen to these words—

> "in any manner to alter or modify the course, location, condition or capacity of the channel of said navigable waters of the United States, unless approved and authorized by the Secretary of War."

Therefore, in 1890, before they had expended one penny upon this great improvement, they had fair notice that, if they thereby desired to impair or alter the course, location, condition or capacity of the channel of any navigable waters of the United States, they must first get the consent of the Secretary of War.

Now, let us see how they tried to get that consent, and what happened:

In 1892, the United States became aware of the fact that Chicago was planning a very extensive water scheme, which might threaten the navigability of the Lakes. A board of engineers was then appointed to consider and report upon "the probable effect of the operation of the Chicago Drainage Canal upon the lake and harbor levels and upon the navigation of the Great Lakes and their connecting waterways."

Now, please remember, therefore, that the War Department appointed a board of engineers before even the bids had been invited for the construction of any part of this work.

On March 22, 1895, the United States Engineer at Chicago wrote to the Sanitary District to ask for information to aid

the board of engineers, as to what conclusions the Sanitary District had arrived at as to the effect of its plans—I am now quoting—

> "upon the levels of the Great Lakes by the operation of your canal."

On August 16, 1895, the board of engineers reported—now listen to this:

> "The abstraction of 10,000 cubic feet of water per second from Lake Michigan will lower the levels of all the lakes of the system, except Lake Superior, and reduce the navigable capacities of all the harbors."

That would not seem to require any extensive engineering genius, to know that; because I would simply like to indicate to the Court what 10,000 cubic feet per second means in one single calendar day: It is 864 millions of cubic feet of water every day of the year that Chicago is now diverting, and has steadily diverted during the sixteen years that the United States, in its own courts, has sought by peaceful methods to stop it.

So I say that on August 16, 1895, the board of engineers of the War Department had already found the fact that the abstraction of 10,000 cubic feet of water per second would have that effect.

On June 16, 1896, the Sanitary District wrote to the Secretary of War, and after referring to the fact that the canal was under construction, asked his permission to proceed with the work upon the lines indicated, and so far as is consistent with propriety, the cooperation of the United States engineering department.

On July 3, 1896, the Secretary of War, having under consideration the question whether the abstraction of even 5,000 cubic feet of water per second would affect the navigability of the Chicago River and of the Great Lakes, permitted the change of the current of the Chicago River, with this proviso:

> "That this authority shall not be interpreted as approval of the plans of the Sanitary District of Chicago

to introduce a current into Chicago River. This latter proposition must be hereafter submitted for consideration.

That it will not cover obstructions to navigation by reason of this work while in progress, or when completed."

So they had expressly said that, while the permit was given to extract 5,000 cubic feet per second from Lake Michigan, it was not to be interpreted as approval of the plans of the Sanitary District.

Now, on October 28, 1897, the Secretary of War, having under consideration an application of appellant to widen the Chicago River, gave the same authority, but with the same condition above quoted.

On November 30, 1898, the Secretary of War, having again under consideration an application—and when I say "an application," I mean always by the appellant—to build a coffer dam on the Chicago River, called the attention of the Sanitary District to the act of 1890—that is the act which I just read, which made it unlawful to alter in any way the channel of navigable waters.

On December 16, 1898, the Secretary of War, having under consideration appellant's application to remove certain bridges on the Chicago River, again granted leave; and again with a like recital of the paramount authority of the Federal Government.

On March 3, 1899, Congress strengthened the act of 1890.

And let me say how that came to be strengthened; because it has not yet been suggested to the Court: The act of 1890 made the creation of any obstruction not affirmatively authorized by law to the navigable capacity of any water in respect to which the United States had jurisdiction unlawful.

Now, this Court in the *Bellingham Bay Boom* case, held that the words "authorized by law" included the law of a State, as well as a law of Congress.

And thereupon, in 1899—and by that time the Sanitary District works were nearing completion but had not yet been completed—in 1899 Congress, presumably in view of the decision of this Court, that an obstruction might be authorized under a State law without offending the provision of that act, strengthened it in the following way; it provided:

> "That the creation of any obstruction not affirmatively authorized by Congress to the navigable capacity of the waters of the United States is hereby prohibited."

And then it again added:

> "That it shall not be lawful in any manner to alter or modify the course, location, or condition or capacity of any port, canal, lake, or the channel of any navigable water of the United States, unless the work has been recommended by the Chief of Engineers and authorized by the Secretary of War prior to the beginning of the same."

Now, on March 10, 1899, another permit was granted to erect another bridge over the Chicago River, with a like condition.

On April 22, 1899, appellant again applied for permission to open the channel constructed by it as soon as it was completed. That is interesting, as showing that when Congress strengthened the act of 1890 by the act of 1899, as a matter of fact their works were still under construction and had not been completed. The application recited the necessity under the act of 1890 of obtaining the authority of the War Department; that is, the appellant's own application recited the necessity of getting the consent.

Thereupon, it was referred by the War Department to the local engineer of the United States in Chicago. And I want to read a part of his report to his superior. He says:

> "It is a strange fact that this city has expended, or will expend, over $30,000,000 with the intention of diverting an apparently unlimited amount of water from the Great Lakes to the Mississippi drainage area for

sanitary purposes, without finding out whether such diversion would be allowed by the great interests of the United States and the Colonies of Great Britain along the chain of Great Lakes in the navigation of the rivers and harbors of the Great Lakes. Now they ask the authority of an executive officer of the United States to open a channel that will, to some unknown extent, lower the levels of all the Great Lakes below Lake Superior and of their outlets, introduce a current, also unknown, and not to be ascertained otherwise than by actual experiment, in Chicago River, the most important navigable river of its length on the glode, but which is already obstructed by bridges, masses of masonry and bends, and of difficult navigation at best."

On May 8, 1899, the Secretary of War authorized the opening of the channel upon the following conditions:

"The Secretary of War hereby gives permission to the said Sanitary District of Chicago to open the channel constructed and cause the water of Chicago River to flow into the same, subject to the following conditions:

"(1) That it be distinctly understood that it is the intention of the Secretary of War to submit the questions connected with the work of the Sanitary District of Chicago to Congress for consideration and final action, and that this permit shall be subject to such action as may be taken by Congress.

"(2) That if at any time it becomes apparent that the current created by such drainage works to the South and main branches of the Chicago River be unreasonably obstructive to navigation"—

Note that:

"Be unreasonably obstructive to navigation or injurious to property, the Secretary of War reserves the right to close the discharge to said channel, or to modify it to such extent as may be demanded by navigation and property interests along said Chicago River and its South branch."

Then appears a third provision, that the Sanitary District must assume responsibility for all damage done to navigation by the change of the current of the river.

On July 11, 1900, the War Department, responsive again to applications of the Sanitary District, gave permission to make certain changes in the Chicago River, with the proviso that they were to be subject to the conditions that I have already read.

On April 9, 1901, the Secretary of War restricted the flow of the Chicago River to 200,000 cubic feet per minute.

On July 23, 1901, the Secretary of War again, on application of the appellant, modified the order, so as to permit 300,000 cubic feet per minute between certain hours.

Mr. Justice Holmes: What date was that?

Mr. Beck: July 23, 1901.

On December 5, 1901, upon a further application of appellant, a permit was granted it to divert 4,167 cubic feet of water per second, upon the following conditions—

Now, while our case does not rest upon this permit, yet it is well to remind the Court that the question before the Court is, not whether Chicago Sanitary District was planning these vast works; it is not whether the Sanitary District shall stop the appropriation of the waters of Lake Michigan. It is purely a question whether the Sanitary District shall be entitled to take more than 4,167 cubic feet per second from Lake Michigan, for its municipal purposes. And again, translating that into a day, it means, each day, 432 million cubic feet.

Now, in 1901, the Secretary of War granted permission to take 4,167 cubic feet of water per second; and these were the conditions upon which he gave the permit:

> "That this permission shall be in lieu of the present authorized rates of flow as stated above."

That referred to the 300,000 cubic feet per minute between certain hours of the day, for a certain time.

> "(2) That the permission herein given shall be subject to such modification as in the opinion of the Secretary of War the public interests may from time to time require."

So it was not merely a question of the navigability of the Chicago River, as to which there was a contention that this vast forced current was affecting its navigability. The Secretary of War said that, whatever the public interests might hereafter require, the permission must be regarded as subject to that.

Then follows the third provision, as to the responsibility of appellant for damages to navigation.

On December 29, 1902, the Secretary of War issued a permit authorizing the Sanitary District to divert for a certain 350,000 cubic feet per minute. That is, of course, a great deal more in a day; and in issuing the permit it was stated:

> "We recognize your responsibility as guardian of the interests of navigation."

On January 17, 1903, a permit was granted of the additional flow of 350,000 cubic feet per minute until March 31, 1903, when it expired.

On March 14, 1903, the Illinois Legislature increased the corporate limits of the City of Chicago, which, of course, very much changed the nature of the problem; and although it is not necessary for my case to say that what was done when Chicago was a small city is not necessarily binding upon the Government in reference to the larger city, yet it is well to remember, when you consider the acts of the Washington Government in this matter, that the situation was changed with the growth of Chicago, and with this special act, which very much increased it.

On March 14, 1907, the Secretary again having under consideration an application to reverse the flow of the Calumet River—and now we come to where the fight begins. They thereupon, having obtained the permission of the Secretary of War to change the current of the Chicago River so that, instead of flowing into Lake Michigan, it would thence flow through various rivers into the Mississippi, and thence to the Gulf—

Mr. Justice Holmes: (Interposing) Was that in 1907, did you say?

Mr. Beck: 1907, yes, this last date; March 14, 1907. They thereupon asked for a like provision to reverse the flow of the Calumet River, so that it would flow southward, instead of eastward.

Mr. Justice Sutherland: That is further north, is it?

Mr. Beck: It is further south.

Mr. Justice Sutherland: Yes, I see—it is southwest.

Mr. Beck: The Secretary of War, after reciting the report made by the Chief of Engineers on this application, which stated that:

> "In my opinion, this abstraction will undoubtedly lower the levels of all the waters of the Great Lakes, except those of Lake Superior, and thus diminish the nagivable capacity and depth of the various channels and harbors which have been deepened and improved under authority of Congress."

After reciting that, the Secretary of War declined the permit, stating that it was one that required submission of this great question of capital and National importance to the Congress of the United States.

On September 11, 1907, the Secretary of War again, upon an application to connect Lake Michigan with the North

Branch of the Chicago River, gave the permission, with the express proviso:

> "That the total diversion of water from Lake Michigan through the Chicago River into the Illinois River shall be no greater than already authorized by past War Department permits."

Now comes the act as to which Mr. Adcock was prudently very silent.

Up to that time the Sanitary District had recognized the paramount authority of the Federal Government over these extra territorial waters—I mean Lake Michigan. It had at all times recognized that all it could obtain of waters that were beyond its territorial boundaries was that which the Federal Government would permit. It also recognized that it could not reverse the course of two rivers that, for centuries had flowed into Lake Michigan, without the consent of the Federal Government.

But the moment that the Secretary of War declined to reverse the course of the Calumet River, as he had authorized the reversal of the course of the Chicago River, the Sanitary District thereupon passed this resolution:

> "Whereas, This board is advised that it has the right and that it is its duty under the laws of the State of Illinois to construct its said channel and reverse the flow of said Calumet River, notwithstanding the refusal of the Secretary of War to issue a permit authorizing the same, for the purpose of furnishing the proper sanitary methods of disposing of the sewage of the territory and inhabitants contiguous to the said proposed channel and within the corporate limits of the Sanitary District of Chicago, and unless restrained by a court having jurisdiction of the subject matter at the instance of the United States Government."

In other words, it simply flouted the Federal authority over the question and insisted that it was going to take what Chicago needed for its sanitary purposes, the War

Department to the contrary notwithsanding, unless a court should declare otherwise.

Mr. Justice Butler. What was the date of the resolution?

Mr. Beck: The resolution, sir, is September 18, 1907.

On March 23, 1908, on what was an implied invitation to us to begin an action if we wanted to vindicate Federal authority, we brought this action.

It has been intimated to this Court—or, at least, perhaps I misunderstood my learned brother—that all that this action contemplated was an action to restrain obstructions in the Calumet River. Now, let me read, so that you may know the nature of this suit that we brought after the challenge to our authority.

Without taking too much time to read it, the third and fourth paragraphs at great length—I am reading from volume 8 of the transcript of record—paragraphs three and four at great length describe the impairment to the levels of the Great Lakes by the proposed construction; and then coming down to the final averments of the bill, which will show its true nature, it says:

> "*Eleventh.* Your orator further represents, upon information and belief, that the defendant desires, proposes and intends to divert the waters of Lake Michigan as aforesaid, through the said Calumet rivers and the Calumet-Sag Channel as aforesaid, for sanitary purposes and for the development of valuable water power which it proposes to sell; that the Congress of the United States has not fixed any amount of such waters for such proposed diversion, and has not provided for the diversion of any of such waters through the said Calumet rivers and the said Calumet-Sag Channel, and that the Secretary of War of the United States, under the direction of Congress, or in any other way, has not fixed any amount of such waters for such proposed diversion, but, on the contrary, has refused so to do, and has refused to authorize the diversion of any of such waters through said rivers and said channel.

"*Twelfth.* Your orator further represents that the defendant cannot lawfully construct or maintain the said proposed Calumet-Sag Channel as above described, cannot lawfully reverse the flow of the said Calumet rivers as it plans and proposes to do as aforesaid, and cannot lawfully divert and abstract the waters of Lake Michigan as it plans and proposes to do as aforesaid.

"*Thirteenth.* That the defendant on the sixteenth day of October, 1907, actually began the excavation of the said proposed Calumet-Sag Channel, at the westerly end of the same, with a force of men under the supervision of one William M. McCartney, its assistant engineer, and your orator is informed and believes, and so charges the facts to be, that the defendant intends to, and will, continue and complete the construction of said channel," etc.

Well, perhaps I ought to read it:

"And will, continue and complete the construction of said channel, reverse the flow of the said Little Calumet and the said Calumet rivers as aforesaid, and divert and abstract the waters of Lake Michigan as aforesaid, and maintain said channel as aforesaid, to the manifest and irreparable injury of your orator and its interstate navigation and commerce, unless restrained by the injunction of this honorable court."

It is an amazing fact that we are now in the concluding chapter of that litigation, that has been pending for 16 years. And if this Court will read the bill and answer, you will see that, notwithstanding a great deal of disingenous pleading—I mean averments in the answer—there was no reason whatever why the case should not have been disposed of upon bill and answer. And yet 5,000 pages of testimony were taken upon issues that, while appropriate before a committee of Congress, were wholly inappropriate in a judicial proceeding. And six years were consumed in that way.

On June 27, 1910, notwithstanding the pendency of this suit, they again applied to the Government for permission to open this channel, with the understanding, as they con-

cede, that the total quantity of water to be withdrawn from Lake Michigan was not to exceed that already authorized by the Secretary of War.

The Secretary, on June 30, 1910, granted the permit, upon the following conditions, among others:

> "(*a*) That it be distinctly understood that it is the intention of the Secretary of War to submit the questions connected with the work of the Sanitary District of Chicago to Congress for consideration and final action, and that this permit shall be subject to such action as may be taken by Congress.
>
> "(*d*) That the amount of water withdrawn from Lake Michigan, through the Chicago and Calumet rivers together, shall not exceed the total amount of 250,000 cubic feet per minute (4,167 cubic feet per second) already authorized to be withdrawn through the Chicago River alone."

And, therefore, our Government, acting with the very greatest consideration for the interests of the City of Chicago, having first refused permission to reverse the flow of the Calumet River, now granted it; and it was accepted, and the current was reversed by the Sanitary District of Chicago, upon the faith of what the Secretary of War had provided, that it would not take from the waters of Lake Michigan more than 4,167 feet.

February 5, 1912, appellant asked the Secretary of War for permission to withdraw from Lake Michigan not to exceed 10,000 cubic feet per second, such permission to be revocable. By this time it was quite clear that it was not merely a national question; it was international. The British Empire had intervened and protested against what, to them was a great wrong. The Dominion of Canada had its representatives make representation that they were being affected, as far as the St. Lawrence River, by this diversion, because at that time they were using far in excess of the amount that they were permitted to take—on this diversion of 864 million cubic feet of water per day.

On January 8, 1913, the Secretary of War rendered his opinion. Now, I will not take time to read that, although it would be the most effective thing I could do in argument. But that was by Mr. Stimson, as Secretary of War. On this application of theirs to divert 10,000 cubic feet of water per second, the Secretary held it under consideration for 11 months; and in those 11 months the most patient and exhaustive hearings were held. At those hearings were not only all the great interests involved in this controversy represented by counsel, but the Dominion of Canada likewise.

In those hearings, it was shown that the levels of the Great Lakes had been reduced, anywhere from four to six inches; and that it had an effect upon navigation which, in its most moderate estimate, was not less than $1,000,000 per year to private owners; that its effect was felt as far as Niagara Falls, and as far as the water power projects on the St. Lawrence River.

And let me add that the chief engineer for the Sanitary District disclaimed any intention to question the calculations of the engineers. There were various boards of engineers who, upon a patient and exhaustive examination, had found that the Great Lakes were slowly falling and that, in many of the important harbors, there were already very practical and serious consequences due to the act of the City of Chicago.

Secretary Stimson thereupon refused to grant the permission. He rendered an opinion, which the Court will find in the record, and he made certain findings of fact. And the ultimate findings are these:

> "*First.* That the diversion of 10,000 cubic feet per second from Lake Michigan, as applied for in this petition, would substantially interefere with the navigable capacity of the navigable waters in the Great Lakes and their connecting rivers.
>
> "*Second.* That that being so, it would not be appropriate for me, without express congressional sanction, to permit such a diversion however clearly demanded by the local interests of the sanitation of Chicago.

"*Third.* That on the facts here presented no such case of local permanent necessity is made evident.

"*Fourth.* That the provisions of the Canadian treaty for settlement by joint commission of 'questions or matters of difference' between the United States and Canada offer a further reason why no administrative officer should authorize a further diversion of water manifestly so injurious to Canada against Canadian protest."

And thereupon he declined to grant the petition.

On February 24, 1913, following that, the United States Engineer at Chicago, becoming aware that Chicago was using a great deal more water than the permit had given authority to use, wrote to the appellant and asked what it intended to do to keep future operations within the limits of existing War Department permits.

To that letter there never was a reply.

On March 15, 1913, the United States Engineer at Chicago again wrote to the Sanitary District of Chicago, for a reply.

On March 22, 1913, the attorney for the Sanitary District wrote a letter to the engineer, in which he suggested that it would be well for the Government to bring another suit, in which he said that if we brought another suit that would cover all phases of the litigation, that he would speedily—I quote his words:

> "The Sanitary District will cooperate to speedily make up and try the issues"

of the case.

Now, there never was a disputable issue of fact that a court could consider, and very few disputable questions of law that need any real discussion; because all pertinent questions of law were decided by this Court just a century ago in *Gibbons* v. *Ogden*.

And yet this cooperation that is "to speedily make up an issue" and get a decision upon the merits of the second suit

(which we thereupon brought) has been so manifest that today, eleven years later, we find ourselves in the Supreme Court, still vainly asking for an injunction that we had asked sixteen years ago to prevent this impairment.

On October 6, 1913, the Government commenced its second suit.

And again I say to the Court, before you read any of the testimony in this case, only read the pleadings. They are voluminous; they are prolix; they contain a great deal of irrelevant matter; but if you read the pleadings, you will marvel that the case was not passed upon by the court on bill and answer.

Now, we come to what happened to the legal proceedings. And here is a chapter that it is difficult to dwell upon with self-restraint:

For six long years the Government of the United States was held back by testimony, nearly all of which had no legal relevancy whatever. It was on the ground of Chicago's sanitation needs; and whether we had acquiesced by estoppel, and various other issues that you will see in the record; but none of them of sufficient merit to have had any serious discussion by opposing counsel.

At the end of six years, it was at length submitted to Judge Landis. Judge Landis held the case for six years more; and at the end of six years, the Government protesting against the delay, he sent for counsel and thereupon told them that he had found the facts in favor of the Government; that he had reached the conclusion upon the testimony that the navigability of the Great Lakes was affected. He sustained the legal contentions of the Government. He sustained our contention, made from the beginning, that these affirmative defenses which had taken all this time were irrelevant in law. We had filed exceptions from the beginning, protesting against the prolongation of legal proceedings, by all manner

of irrelevant defenses; and our exceptions had been overruled. And now, at length, after the horse was stolen, the barn door was closed, by saying that we were entirely right, that these affirmative defenses were valueless.

Mr. Justice Brandeis: What was the date of that?

Mr. Beck: The decisions of Judge Landis?

Mr. Justice Brandeis: Yes.

Mr. Beck: It was on June 19, 1920. Now, Judge Landis felt that he owed some explanation to the Government of which he was an administrator of justice, and to the parties; and he said that his delay was in part due to the fact that the Great War was in progress—although it would occur to some of us that the very existence of the Great War made the navigability of the Great Lakes of even greater concern.

Secondly, he said that he had the understanding that there was a possibility of a composition of differences here, that would enable the questions to be permanently adjusted; and then at the end of his oral opinion, which directed a decree in favor of the Government, he gave what was evidently, and what he himself says was, his real reason: He said that he did not want the injunction that he directed to issue to us for 30 days; and he added:

> "Make that 60 days, and you may put in it, if it does not destroy the appealability of the order, you may put in a provision retaining me in control. The thing that the Government wants, at least the court wants, being a citizen of Chicago, the thing I want is water without microbes. That is why I have held your lawsuit."

Thereupon the counsel, still "speedily cooperating" with us for a speedy decision of the case, sought leave to open the case *de novo*, in order that the decree could be modified —with this extraordinary suggestion: That if we, having for six years litigated this question, and having now established that we were entitled to the injunction to restrain them from using more than 4,167 cubic feet of water per second—

they now came in and said, "If you will allow us to take 10,000 cubic feet a second, and will give us 25 years, at the end of 25 years we hope to take care of the sewage of Chicago in excess of that, for which the 10,000 cubic feet is now adequate."

In other words, they wanted us, at the end of the litigation, to surrender every contention we had made, accept their diversion of 10,000 cubic feet a second, and trust to them that, as Chicago went forth with the stride of a giant, at the end of 25 years they might do something to stop the further diversion of water from Lake Michigan.

Now, Judge Landis having given this oral opinion and directed the decree, thereupon, for two years more, he refused to enter that decree. The Government protested; it protested again and again. Judge Landis would not enter the decree. They could not appeal.

I became Solicitor General. The archives of our Department were full of letters from the Secretary of War asking whether something could not be done. He, in turn, was subjected to pressure from the great States that were being seriously affected. And finally I determined—and I say it without hesitation—to address a communication to the Judiciary Committee of the House of Representatives calling attention to the fact that, although we had obtained a recognition of our rights to an injunction, the formal order and decree we could not get the court to enter.

Mr. Justice McReynolds: Mr. Beck, is there anything to hinder the United States from asking for a mandamus to overcome a situation like that?

Mr. Beck: I think there is no reason—

Mr. Justice McReynolds (Interposing): I have considered it myself in the past; and I wish you would try it the next time this thing happens.

Mr. Beck: I am greatly obliged for your Honor's suggestion; and I certainly will take the liberty of submitting it to the Attorney General.

But if every city in this country were to adopt what I say, with reluctance, was the selfish policy of the Sanitary District of Chicago, the only way that the Federal Government could vindicate its authority would be, not to go into its courts at all, but to do exactly what was done at the time of the Pullman strike—to stop by force such forcible appropriation of something that does not belong to the City of Chicago.

Well, Judge Landis, I say, for two long years refused to enter that order; and just as I was about to make it the subject of a communication to the Judiciary Committee of the House of Representatives, he was translated into the higher realms of baseball jurisprudence; and thenceforth the Government started with a new deal.

Nevertheless, it was another year before we finally got the decree—I do not say this with respect to Judge Carpenter as being any criticism of him; because when the case was finally assigned to him, after Judge Landis had resigned, Judge Carpenter was ill for a time; and it took time to do it; and there is not the slightest imputation on my part of any delay on the part of Judge Carpenter.

But at all events, it was June 18, 1923, before we finally got a decree, in a case that we had instituted fifteen long years before in the courts of this country, to vindicate the authority of the United States.

Now, those are the skeleton bones of this controversy.

Can this Court recall, in all the litigation of this character, anything comparable to this? There have been many controversies before this Court between the United States and either private interests or public interests, with respect to obstructions wholly within a State, and concerning nav-

igable waters that were wholly within a State. But can this Court recall a single instance where, in the case of a great interstate water highway connecting the heart of the continent with the Atlantic ocean, dedicated by the Ordinance of 1787 forever as a public highway; authority over which, plenary in character, was assumed by the Constitution of the United States—where a suit having been brought under that Constitution, namely, to stop just such unlawful and conflicting action of the States with respect to interstate commerce, there has been anything comparable to this. Can you imagine a waterway so vast in extent and so purely national and international in character that could be impaired and the interests of every one having rights upon that great highway be sacrificed for sixteen years by a city, however great? And no one admires the greatness of Chicago more that I do. As the Chief Justice said yesterday to the learned counsel for the Sanitary District—he said: "Well, you needed the water; is that not the fact, that you needed the water?" And he assented. The only defense that can be suggested is that they needed it, and they took it. And they are taking it to this day; and they are going to take it just as long as the strong arm of the Government fails to stop them.

And the great problem that is going to confront this Court, I venture to say, is not going to be so much the problem of the legal merits of the case, but what to do with the conditon which has been created by the unwillingness of the Sanitary District of Chicago to respect Federal authority, and which, unfortunately, may affect millions of men and women.

Of course, it will be understood that the Government does not concede for one moment that the utilization of 4,167 cubic feet per second will not answer the sanitary needs of Chicago. It may not answer the hydroelectric needs at the works at Lockport. That is a different proposition. But if it had ever been necessary for the Government to take up the question as to how far the health of Chicago could be preserved

by the utilization of this vast quantity of water which we permit, why we would have had some testimony to offer on that subject.

The attitude of the Sanitary District of Chicago in this matter recalls to my mind language used by this Court in a case which, if any other opinion than that of *Gibbons* v. *Ogden* was necessary, would be very pertinent authority. I mean the *Wheeling Bridge* case. In the *Wheeling Bridge* case, the State of Virgina authorized, as the Court will remember, a bridge across the Ohio River. The bridge was wholly within the State of Virginia. Pennsylvania brought a bill to restrain the maintenance of that bridge.

Now, let us see what this Court said with respect to what was fairly due to a court of equity—and if that is due to a court of equity in litigation between one State and another, how much more is it due to a court of equity where the United States in its soverign capacity is the litigant? This Court said in the *Wheeling Bridge* case:

> "The Bridge Company had legal notice of the institution of the suit, and of the application for an injunction to stay their proceedings, before their cables were thrown across the river. This should have induced them to suspend, for a time, their great work, alike creditable to the enterprise of their citizens, and the genius and science of the engineer who planned the bridge and superintended its construction. It is a matter of regret that, by the prosecution and completion of the bridge, they have incurred a high responsibility.
>
> For the reasons and facts stated, we think that the bridge obstructs the navigation of the Ohio, and that the State of Pennsylvania has been, and will be, injured in her public works in such manner as not only to authorize the bringing of this suit but to entitle her to the relief prayed."

Now, if only the administration of the Sanitary District had read those words in 1890, before they had ever incurred so much as a dollar of expense; before the work of construc-

tion had begun; if they had then said, "In view of the position of the United States Government and this act of Congress which forbids us to in any way alter, modify or affect the navigable capacity of any river or lake"—if they had said, "We will not proceed in the thing until we first see whether we can get the approval of Congress", the very serious and difficult situation that confronts this Court—and that will confront, I venture to predict, the Congress—would all have been spared.

Because at that time it might well have been that Congress would have said to the State of Illinois, "If you can purify your sewage by the methods adopted by London, Berlin and Paris, and without impairment of the waters of Lake Michigan, we cannot give you the consent and you must use other methods known to science"; or the Government might have said, "We will cooperate with you to the extent of allowing a certain amount of water—always provided that the amount of water that you divert does not substantially affect the navigation of the Lakes.

And they might then, long since, instead of now; instead of now, at this late day asking for 25 years in which to prepare to respect the rights of others—they might well have said, "Give us the 4,167 cubic feet per second and we will start now, in 1900, the construction of a sewage disposal plant according to enlightened and scientific methods. We have no desire to injure other interests on the Great Lakes; the Great Lakes are the pride of Chicago, as well as of Duluth, Cleveland or any other city they are on. It is our highway as well as theirs; and therefore we will not in any way impair the navigable capacity."

But instead of doing that, with the full knowledge of the position of the Federal Government, they proceeded to spend hundreds of millions of dollars, upon a plan that is destructive of all—I will not say "comity", because it is not a question of comity; it is a question of power. It is violative of

the power of the Federal Government as the great trustee of the interstate navigable waters, and is certainly destructive of the great interests of millions and millions of other people who live along the Great Lakes.

And if it were permitted, of course it would simply mean that, if Chicago could utilize at pleasure the waters of Lake Michigan, Cleveland can do it; Duluth can do it; Buffalo can do it; and we would be back exactly where we were before the Constitution of the United States was adopted, namely, a mass of conflicting regulations of commerce, with States and Cities grabbing everything in sight, without reference to the common weal; and with a state of affairs which, had the Constitution of the United States not been adopted, might conceivably have ended in war.

Because, as a matter of fact, nothing is more significant in the proceedings of the Constitutional Convention, than the very grave apprehension that Washington felt, and Franklin felt and others felt, that if that convention failed method of adjustment between the constituent States would be one of the sword and the gun, and not the peaceful methods of the political charter.

Now, I think I can complete before the Court takes a recess all that I care to say. I had intended—but it seems so useless—to make an argument upon the legal propositions; I cannot think that they can be in any doubt.

The Chief Justice: Mr. Beck, there was an issue made as to the proof, or the weight of the proof—as to whether this diversion reduced in any way substantially the depth of water in the ports and the harbors along the Great Lakes?

Mr. Beck: Well, yes; but our answer to that would be that the finding of the Secretary of War at the time that first suit was started was conclusive of the question as to the effect; and that therefore it was not any longer open to judicial controversy.

But if you eliminate the effect to be given to his findings—and he was the person to whom Congress had delegated the authority; because he was not speaking as Secretary of War; he was speaking as the authorized arbiter of Congress; and when Congress said, "If the Secretary of War finds that an obstruction exists," I take it that that, as any political act of Congress, would be binding upon the judiciary, unless there was, of course, a gross abuse of discretion in the matter.

Well, I was about to say that I will not pretend to discuss the authorities; because our friends attempted two gigantic tasks: The first task was the phenomenal one of diverting some of the waters of the Great Lakes from their natural destination in the Atlantic Ocean to the Gulf of Mexico—and that was an undertaking grandiose enough to be worthy of Chicago.

The second was equally remarkable—to divert the decisions of this Court for a hundred years, from their course and where their destination now is—and from their immediate origin a century ago, when Mr. Webster in the case of *Gibbons* v. *Ogden*, established the exclusive power of Congress with respect to the interstate waterways of the country. And I think that, as the engineers found in difficult to reverse the current of the rivers and of the lakes, their very great legal talent will find it very difficult—in fact, if we may judge by my friend Mr. Adcock's opening remarks he has found it very difficult—to change the current that has flowed for 100 years of legal authority.

If more than the case of *Gibbons* v. *Ogden*, were needed, I need only remind the Court of the year 1851, when three cases were decided that were conclusive. One case was the *Wheeling Bridge* case, to which I have already referred, in which it was held that, although a bridge was wholly within a State and authorized by that State, yet if it were over a navigable river of an interstate character, the State was without any authority to grant the permission.

The second, of course, was the case of *Cooley* v. *Board of Wardens,* where, although the particular local regulation was recognized, yet it was expressly on the ground that, while, with respect to waters wholly within a State and regulations of a purely local character, they would be recognized in the absence of Congressional action, yet, where it was not of that nature, and where the effect was to regulate or obstruct interstate commerce with respect to matters as to which a uniform rule was required, there the power of the Federal Government was exclusive, without regard to Congressional action.

The third case was that of the *Genesse Chief,* decided in that great term of the Court, where this Court held that the Federal Government had an admiralty jurisdiction over these Great Lakes, which it denominated as "great inland seas."

Now, the law as thus defined at that time has never been expressly questioned. And it, possibly, has had a very recent and a very careful defintion in the *Minnesota Rate* case, where Mr. Justice Hughes, in speaking for this Court, said:

> "The grant in the Constitution of its own force, that is, without action by Congress established the essential immunity of interstate commercial intercourse from the direct control of the states with respect to those subjects embraced within the grant which are of such a nature as to demand that, if regulated at all, their regulation should be prescribed by a single authority. It has repeatedly been declared by this Court that as to those subjects which require a general system or uniformity of regulation, the power of Congress is exclusive. In other matters, admitting of diversity of treatment according to the special requirements of local conditions, the states may act within their respective jurisdictions, until Congress sees fit to act; and, when Congress does act, the exercise of its authority overrides all conflicting state legislation."

This Court will remember that in the *Newport and Cincinnati Bridge Co.* case, decided some years after the *Wheel-*

ing Bridge case, not only Kentucky and Ohio had legalized the bridge, but the United States legalized it, and thereafter it became apparent that the obstruction, either by the growth of population or the changes in commerce, or otherwise, while originally not a nuisance, had become a nuisance. And Congress withdrew its consent. Thereupon it was said—and it is so apt to the argument which has been made here today, that Congress, by some species of estoppel, or acquiescence, or waiver, has permitted Chicago to construct this great canal and is therefore estopped from any action with respect to it.

It is fair to remember that, in the *Covington Bridge* case, Congress having withdrawn its assent, this Court said that Congress had full power to withdraw what it had once given; for the very reason that, of course, as the trustee of interstate commerce, it cannot bargain away its mighty trust; it cannot sell or barter away forever its police power. It certainly has the right at any time when, in the changing conditions of commerce it becomes necessary for a new rule or regulation with respect to that commerce to be adopted, to prescribe a new plan, even though it conflicts with some regulation that it has previously made.

(Thereupon, at 2:00 o'clock p. m., the Court took a recess until 2:30 o'clock p. m.).

AFTER RECESS.

Oral Argument of Hon. James M. Beck, Solicitor General of the United States—Resumed.

The Chief Justice: You may proceed, Mr. Beck.

Mr. Beck: If the Court please: I had almost completed my argument at the time the Court adjourned.

But there is one practical consideration that I want to bring to the attention of the Court before I conclude:

Throughout this litigation—and I think the Court will agree with this when it comes to examine the matter—the Government has not been unmindful of the welfare of the people of Chicago. Now, the United States represents, in all matters within its reserved powers, the people of the City of Chicago, not the Sanitary District. And the Government is still very mindful of the welfare of the people of Chicago. It would not have allowed this litigation to drift for sixteen years, if it had not been sensible to what is a hard situation, due to the fact that Chicago is committed to an experiment from which it cannot in a day extract itself.

And therefore, at the end of my brief—somewhat over italicized—I venture to make a suggestion to the Court, if it should reach the conclusion that the Government's contention is right. I will briefly read the substantial part of it; and with that I will close my argument:

> "It is a condition and not a legal theory that confronts the Government. The question is not judicial, and this Court will presume that the Legislative and Executive branches of the Government will not be unmindful of all the equities of the situation.
>
> "As this serious problem will require time for its careful consideration, the Government cannot object, if the Secretary of War, acting on the recommendation of the Chief of Engineers, sees fit, pending the action of Con-

gress, and as a *modus vivendi* to modify the existing permit and temporarily permit a greater diversion of waters."—If he sees fit.

"If there be any doubt as to his power under the authority already delegated to him, the Government has no objection to a proviso in any decree that this Court may enter which will provide that the decree and the injunction, while immediately effective, shall be without prejudice to any temporary permit that the Secretary of War, acting upon the recommendation of the Chief of Engineers, may see fit to grant in the nature of a *modus vivendi*, pending the action of Congress in the premises.

"This would set at rest the authority to make some temporary arrangement in the event the present Congress could not dispose of the question before it adjourns *sine die* on March 4, and especially in the event that Congress might not be again in session until the first Monday of December next.

"It should, however, be made clear that the recognition and enforcement of the just rights of the United States Government are not to depend on or to await the conclusion of any argument between the Sanitary District and the Government. It should not be a question of what the Sanitary District should now concede, but what the Government of the United States should now allow.

"If Congress, (or the Executive, to the extent of its delegated power), voluntarily and in consideration of the inherent difficulty of the situation and the welfare of the people of Chicago gives some temporary permit until the whole problem can be finally solved by Congress, there should be no further opportunity for the Sanitary District to begin the litigation afresh and prolong it for another sixteen years under the plea that the decree of this Court was entered upon the faith that the Sanitary District and the United States Government should make some contract in the matter.

"The question is not one of contract, but of governmental power. The United States has the right to stop the unlawful diversion of the Sanitary District of the waters of Lake Michigan for the uses of the City of Chicago.

"In exercising this power, it need not bargain or contract with the Sanitary District.

"Its power is not that of a coequal, as the learned counsel for the Sanitary District seem to intimate, but the power of a sovereign."

Mr. Justice McReynolds: What relief have the United States asked in this matter?

Mr. Beck: We have asked that they be enjoined from diverting any waters of Lake Michigan in excess of 4,167 cubic feet per second.

Mr. Justice McReynolds: Well, what authority have we to go into that?

Mr. Beck: What authority? I do not think this Court has any authority to go into that. But I think this Court, in entering a decree, could eliminate any doubt on the subject, by making it clear that the Secretary of War, acting on the recommendation of the Chief of Engineers, that being the authority to which the Congress has delegated it, can, if he sees fit, grant a temporary permit, in the nature of a *modus vivendi*, for the excess—

Mr. Justice McKenna (Interposing): And go over this whole investigation again? Do you mean to go over the whole investigation again?

Mr. Beck: No, sir. That is why I was so insistent that, if this Court should follow that suggestion, it be made perfectly clear that it is not a question of any negotiations or contracts with the Sanitary District; but it is wholly a question of what the Government now, proceeding in its own way, will allow, if anything, beyond what it has already granted.

Mr. Justice Holmes. You mean merely to make it plain that the injunction will not prohibit allowing the use of the water to such extent as the Secretary of War for the time being, working under the act of Congress, may permit?

Mr. Beck: Yes, sir, that is the thought of the Government.

Argument of Hon. Andrew B. Dougherty, Attorney General of Michigan, amicus curiae, in favor of appellee.

Mr. Dougherty: May it please the Court: I am here as the representative of the Attorneys General of seven great States bordering on the Lakes—all of those States except the State of Illinois.

We have a vital interest in this suit. We all believe that we have property rights in the waters of the Great Lakes. We have on those lakes and connecting rivers 2,900 and some-odd miles of coast line. The State of Michigan, where I live, has 1,624 miles of coast line. All of it, except that part bordering on Lake Superior, is affected disastrously by any diversion of water. Lake Superior, being above the falls of the St. Mary's River, of course, is not affected. But every drop of water taken by the State of Illinois, or its agents, must necessarily substract a drop from the waters of Lake Michigan, from the waters of Lake Ontario, from the waters of Lake Huron, and a smaller proportion from the waters of Lake Erie.

Mr. Justice McReynolds: Are you asserting any right of your own here under this bill?

Mr. Dougherty. I am not a party to the bill.

Mr. Justice McReynolds. I am trying to see what your claim is: Are you representing the Government, or what?

Mr. Dougherty: I am with the Government.

The Chief Justice: He is the Attorney General of Michigan.

Mr. Dougherty: I am the Attorney General of Michigan.

Mr. Justice McReynolds: Well, do you stand on the rights of the United States, or on your own, or what?

Mr. Dougherty: We stand on the rights of the United States.

Mr. Justice Holmes. While asserting that, I presume your position is that, if you see fit to bring a bill, you would have a *locus standi* to bring suit?

Mr. Dougherty: Yes, we would have. Wisconsin brought an original bill in 1922. That bill has been answered, and the case is now in abeyance and will be brought to trial and orders for proofs taken, I presume.

The Chief Justice: And we permitted you to argue here because you were directly interested in the question whether the United States had power to bring this bill and enforce it?

Mr. Dougherty: Yes, your Honor. We are interested, in Michigan, Wisconsin and Minnestota, and in other States in a lesser degree, in these lakes, because they are the great natural highway of the interior of the country.

We produce in those three States a large proportion of the iron ores. They must all go to market. They have to go to market in the East. They have to go over the Lake course—at a cost of one-tenth of the railroad freight. Those things have to be brought down from day to day and from year to year, to keep pace with the economic advance.

Now, Mr. Goulder will follow me for a few minutes; and I have but a few minutes to speak. But let me say that the commerce of the Great Lakes has increased some 4,000 times since the St. Mary's canal was built. All the ores goes through that way, except a few that go out of Escanaba and go to Chicago.

And the gentlemen said that it was only the large interests that were complaining. If your Honors please, every man who owns a fishing boat and keeps it in the mouth of a creek or cove; every man who owns a pleasure boat, has suffered from this.

Now, I am not going to take any time to go into the argument of whether these lakes have been lowered or not; but I want to state one fact:

The three largest tributaries of Lake Michigan, the St. Joseph and Grand Rivers of Michigan and the Fox River in Wisconsin, bring to Lake Michigan 11,500 cubic feet of water per second. The Chicago Sanitary District has created a channel that takes away almost the equal of the flow of those rivers, 10,000 feet a second. It is not necessary to demonstrate, by figures or in any other way, that there is a lowering of the lakes. That fact is patent from that statement. I use the Government engineers' reports.

The State of Illinois owns to the boundary line in the center of Lake Michigan; along a shore line of some 60-odd miles, about 30 miles out, is the boundary line as prescribed by the enabling acts of Congress. There is an area of about 2,000 miles. The State of Michigan has an area, according to the figures furnished by the International Waterways Commission, of some 22,000 miles of those waters. Illinois, with an ownership of ten per cent, practically, of those waters, presumes to own all of them.

I do not believe that is the law. I believe, as this Court enunciated in the *Port of Seattle* case against the Oregon-Washington Railroad Co., that Michigan owns every foot of water within her boundaries, subject only to the right of the Federal Government to use those waters for navigation.

And I do believe that, when the Federal Government takes the waters, or uses the waters, for navigation, it should, in its wisdom, use those waters to improve the navigable system in which they are found, rather than to transport them to another navigation system, which is watered by the great Father of Waters.

We do not envy Chicago her growth and prosperity. We claim, however, that Chicago should respect our rights. We do claim that there is an ample way to take care of this sewage without a diversion of our property, if the Court please.

I do not think, in view of the shortness of the time, that I will take the time allotted to me, but will leave it to the Government counsel. But I do want this Court to understand that all the people of Michigan, and the people of the other States, have been for years vastly interested in this subject; and that they deem this an invasion of their rights.

Thank you.

Argument of Harvey D. Goulder, Esq., counsel for The Lake Carriers' Association, amicus curiae, in favor of appellee.

The Chief Justice: Mr. Goulder.

Mr. Goulder: May it please your Honors: My time is limited, and I will not take more than ten minutes in stating some of the points that the Solicitor General has asked me to make.

I filed as *amicus curiae* a short brief, which I trusted, from its very brevity, might take the interest of the Court sufficiently for them to read it. And in that brief are citations, I think, of testimony and the principal legal authorities that are of moment in this case.

Of course, with the Solicitor General, I share the feeling of doubt as to what is the position of the other side. But I take it from their answer, which denies that they ever recognized the authority or the right of the United States Government to interfere in any manner, either with the construction, or with the quantity of water to be taken from Lake Michigan; and the fact that their statute of Illinois creating the district said that, if a channel were erected which connected the DesPlaines River, it should be a navigable channel, and that the United States in that case would be authorized to have control over it for navigation purposes, but not to interfere with its use for sanitation and drainage purposes—I take it that that is their position.

Now, counsel on page 94 of the reply brief says that they have a right to use the navigable waters of the United States for the local interests as determinined by the local authorities.

The President of the Sanitary District stated—and he is quoted in Secretary Stimson's report and decision—that it was pernicious to suppose that 10,000 cubic feet should be the limit, and that they were entitled to all the water that they might want or take, as their interests and their necessities for sanitation purposes required. On which the Secretary commented, as stated in my brief.

> "It is therefore quite conceivable that compliance with their sanitary needs according to this method of sanitation may eventually materially change this great national water course now existing through the Lakes."

I shall content myself with trying to picture very briefly what this commerce is that we are talking about.

Here (indicating on map) are the Great Lakes. Here is Duluth (indicating); here is Chicago (indicating); here are the Straits of Mackinac (indicating); here is the "Soo" canal (indicating), where there is a fall of 19 feet from Lake Superior.

There we have created that enormous commerce, so that through that canal there passes, during the eight months of the season of navigation, more than double the tonnage passing through the Panama and the Suez Canal.

Down here (indicating) we reach the foot of Lake Erie: and here (indicating) is Niagara Falls. Now, for our big ships, which are the great bulk of the trade, or nearly all of the trade, we are stopped at the foot of Lake Erie (indicating).

The records show (and the testimony in this case bears it out) that the large ship of the Great Lakes is 600 feet

or a little more in length, about 55 feet beam, and about 32 feet of molded depth—

The Chief Justic. 32 feet of what?

Mr. Goulder: Molded depth; that is the depth from the top to the bottom of the ship. These ships would draw 22 or 24 feet of water with perfect safety.

And in the evolution of the Great Lakes, and in this enormous business, the ship that does not carry more than 10,000 tons is either obsolete or rapidly becoming obsolete. It is also the subject of testimony in the case, and in the official reports transmitted by the Secretary of War—and I made references to those in my brief—that these ships, all of them, load to 20 feet, or can load to 22 feet or more. They say—just let me read it; it will be quicker than paraphrasing it:

> "The Great Lakes system forms one of the world's greatest highways for water-borne transportation. The Great Lakes fleet moves more than 100 million tons of freight each season. These vessels are from 280 to 265 feet in length"—

Nearly all of them in this trade now are 500 feet or more in length—

> "and have a carrying capacity of from 3,000 to 15,000 short tons. Most of them can be loaded to a draft of about 22 feet. They are the most economical carriers in the world, their rates usually being less than one-tenth of a cent per ton-mile, and sometimes only a third of that amount. Rail rates are several times as much, often being at least ten times the water rates. The annual saving over the cost of moving this same freight by rail exceeds a quarter of a billion dollars."

A quarter of a billion dollars saved to the public each year. I would estimate that at nearer half a billion.

Now, some more facts about this: We have some maps here showing the movement of iron ore. Our industrial supremacy is largely based on iron and steel. Eighty-six

per cent of all the iron and steel made in the United States is from the ore that comes down this waterway;—and an English committee reported years ago that we never could rival England in that respect, because, while we had the raw material, the cost of transportation would always be prohibitive. The cost of transportation is now about one-fifth what it was at that time; and that has built up this entire industry, which with all of these millions of men employed and billions of dollars invested, is dependent upon this waterway.

I may illustrate further: In the statistical book of the War Department—which they started issuing since your Honor the Chief Justice was there—they get their statistics from the different districts and put them all together, combining them—showing all the foreign, domestic and internal commerce; and they show that, of all of the water-borne commerce of the United States on all of the coasts and all the internal waterways, 27 per cent is carried over the Great Lakes. It is more than the total of the foreign commerce in and out of the United States, on both coasts. It is about 45 per cent of all the foreign and coastwise trade of the Pacific, the Gulf and the Atlantic coast.

That is the story,—I wish I had time to dwell on it—of what this great water route is which they threaten, and which the Government is trying to conserve.

The Chief Justice: Can you tell us, Mr. Goulder, or have you figured upon it, how much loss would be entailed to this navigation in any way by the lowering of the level of the Lakes six inches?

Mr. Goulder: Yes, your Honor, my two points succeeding this, which are the only ones I want to bring out—and I will do so as briefly as I can—will indicate what the injury is and what the loss is due to that lowering of the level.

Now, the effect of taking a large body of water out from Lake Michigan in reducing levels it is not necessary to prove.

I should say that the proof is ample and all one way, and I cited it on page 25 of my brief. It is uncontradicted and indisputable evidence. It is shown by the records of the War Department, and by the testimony of various witnesses who were called in the case.

In particular, there was a witness named Shenahan, who had a great deal to do with the Coast Service; and he said that the taking of 10,000 cubic feet of water per second from the lake would reduce the level of the lake 5½ inches. Now, up in the Lake Region, we all call it a half a foot—six inches—that is, in Lake Michigan and Lake Huron, which really, as you will see from the map (indicating) are one body of water. There is just the Straits of Mackinac separating them; and the effect would be the same on Lake Erie; below that, it has a greater effect; and on the Lower St. Lawrence River—where they are talking about a "Lakes to the Atlantic waterway"—the diminution is probably a foot.

Now, the appellants recognize this. They deny that there is any diminution. But they recognize it in the proposal for works of some time to compensate for the lowering.

I cannot conceive that question of compensation to be involved in this case. But they recognize the diminution. And the court below held as to this, that the carrying capacity of these 22-foot ships is affected in the result, seriously affected, even by the excess over 4,167 feet that the Sanitary District is using.

I cannot take further time in the discussion of that, but must come to this point: That everything shows this: The testimony is clear and it is unequivocal in this regard, and is confirmed by every report of the Government that can be cited: That one inch of water means from 75 to 100 tons of cargo capacity loss.

So that six inches diminution of water would represent from 450 to 600 tons of freight on every loaded trip on every

one of the ships that have been engaged in this enormous business. I am speaking now about the bulk business—I mean ore flux, stone, grain, of which we carry 500 million bushels in a season, and coal, which is about 30 millions.

And the ship that is not so affected by every inch of reduction of water is either, as I have said, obselete or nearly so.

And may I illustrate: The effect of that reduction of level is just as if the Sanitary District were to go out and spread a floor over the bottom of all that system, five or six inches deep. There is absolutely no difference between raising that in all these critical places—all these channels where the Government has spent $100,000,000 in improvements; it has spent $20,000,000 at the "Soo," which has this enormous tonnage going through it—and lowering the level of the Lakes.

And the lake system is shown by all these reports, and is world-known, as furnishing free, open, unrestricted, competitive transportation—the deepest and most efficient in the history of the world. The Detroit River, according to the reports and the testimony, is the most used water course in all the world. Now, that is what the testimony shows. And aside from my statement here, it is shown by Government reports which are cited in the Government brief and in my brief; it is shown beyond peradventure; and there is not anything in the evidence to the contrary. It is indisputable that that is the effect.

Now, what is the result?

We lose 100 tons—no, I am wrong: On sixty out of some 400 ships engaged, we lose 100 tons an inch, or 600 tons for six inches of lowering of level. On the ships coming next to those, we lose between 500 and 600 tons with six inches lowering.

Now, as to what that loss consists of. I say there are two losses: The direct loss to the ship in freights; and the loss to the general public.

On the question of loss, the Solicitor General said that the lowest estimate ever heard, or ever appearing in any report that was ever mentioned—not appearing in any report, but ever suggested by anybody, was $1,000,000 a year from this diminution. And the Government report says it is at least a million and a half.

Now, aside from the other testimony, which is collated and cited under that head in my brief, there is this—and it is uncontradicted by any syllable of testimony in this case:

Mr. Livingston, the president of the Lake Carrier's Association, was asked to go into it thoroughly and compute the annual loss; and he gives the figures and the reference to volume 1 where his testimony is contained, is in the brief—he gives the figures, and the result at a low estimate he gives as $500,000 per inch. That would be $3,000,000 a year in direct loss of freights through this reduction of the lake levels.

Now, I assert that that testimony of Mr. Livingston, was gotten up with care, and that low figures were taken; he was very careful; he gave his figures, and they show a difference of $500,000 per inch. Now, there is a typographical error in the brief which makes my statement a little garbled; but it was all progressive, with the increasing traffic and size of the ship; and I make the estimate in my brief that, by now, that loss cannot fairly be considered to be less than $4,000,000 a year.

Now, the loss to the general public has been spoken of. There are all the mines, the docks, the elevators, the shipbuilding plants, etc.; then, down below us are all the furnaces; and there is everything involving any ramification of the iron business, or anything made of iron or steel.

There are millions of people spread all over this country; and they are all interested in—what? That we may be able to continue to give the answer to the British committee that we

have heretofore given by our performance—that we can and we do carry this iron ore down at the phenomenally low rates which I have stated, and of which the reports are full, and that that does enable this country to take its preeminent position where we make more steel and iron than Great Britain, France and Germany combined; and 80 per cent of it is made out of this ore, because of this cheap transportation route, without which that could not be accomplished.

And so it is as to all the grain of the Northwest: I spoke about 500 million bushels of grain coming down at these low prices. And there is the coal going up at these low prices, always away below the rail rates; the rail rates for carrying such freight always being more than five times as much, and as the Government report shows, often being ten times as much as the rate by this water route.

May I in closing say this further? That, taking the commerce of the Great Lakes, the Government computations are all based on an average haul of these bulky freights, or bulk cargoes of a little over 100 miles. The total length of the haul from the head of Lake Superior to Lake Erie is approximately a thousand miles. The ton-mile performance of this transportation route equals 25 per cent of the ton-mile service of all the railroads in the United States and it is nearly one-half as great as that of all of the railroads east of the Mississippi and north of the Ohio River.

Now, I submit that when counsel come in on the question of the action of the Government—and I am frank to say that I question the right of Congress to shake off the trust which it has. I question the right of Congress—I do not know that this is involved in this case—or of any authority in the world, with that trust fastened upon those waters, and fastened upon the other hand upon the general government of the United States for navigation and commerce—I question whether there exists anywhere authority to permit the diversion of those waters for sewage purposes or sanitary purposes, or

anything else than navigation purposes. And in that connection there are in the record reports showing that 1,000 cubic feet per second of water is ample for any channel that they could have that would comport with the general Mississippi transportation. They recommended a depth of eight feet for the channel, which might be increased to nine feet; and it is shown conclusively that 1,000 cubic feet per second is enough water for that.

And we have a right, our ships and our people—and I speak not only for ships, but for the cognate interests connected with the transportation part of it—the carriage of all this ore, grain, coal, and everything of that kind—we have a right to come in and say that Chicago may not say, with regard to these interstate and international navigable waters, put in charge of the United States: "We do not recognize the authority of the United States at all in the matter, in any shape or manner. They have no right to say anything, and no authority to say anything about how we do it or how much water we take. If we make a navigable channel, why, we will let the United States come in and regulate the navigation end of it; but they must not interfere with its use for these non-navigation purposes."

And to further say, in the face of the fact, as acknowledged by their own action as stated here by counsel, and as shown in volume 8 of this record, that they are making purification plants. They can do it; and the testimony shows that they took care of 800,000 population; and the highest authority in this country says that urban sanitation, or urban sewage, may be cared for to any desired limit by these shore scientific modern methods. Because we had sanitary engineers, and members of the American Society of Civil Engineers testify, and their testimony dissipated any old idea that this is in any experimental stage and cannot be done.

I refer to Harrison B. Eddy, of Boston, one of the leading sanitation authorities in this country.

And I went further to say as to the local interests that they talk about,—that is that the State or local interests may regulate the water to the exclusion of the United States or anybody else, that there are two things to be thought of: In the first place, they are manufacturing power as the result of this diversion. Their engineer testifies—and I have cited the page in my brief, that they can manufacture power with that flow of water to the value of $2,750,000; and they do manufacture power; and that that power is used in the reduction of expenses, or sold in the reduction of expenses.

Now, a local interest, then, is using this antiquated, discarded, open sewer plan, because it is cheaper than other methods, and they can still further cheapen it by the manufacture of power if they can get plenty of water.

And there is one other consideration: That during all the time of this controversy, the Chicago packers, and a certain foreign products plant, have been pouring the filth of a most unsanitary character (because it has so much of solids) into this sewer, to the extent which they themselves admit—and you have heard the counsel say it—would represent the ordinary sewage of a million and a half inhabitants.

Argument of Joseph B. Fleming, Esq., on behalf of appellee.

Mr. Fleming: Just a few words, if your Honors please, in conclusion of our side of the case; and I shall supplement very briefly the admirable presentation of Mr. Beck on behalf of the Government.

The bill in this case charges, briefly, that this diversion at Chicago did create an obstruction not affirmatively authorized by Congress to the navigable capacity of certain waters of the United States.

The bill charges also, after a recital of the facts, that they sought to alter and modify the course, the condition and

capacity of the two rivers, without work having been recommended by the Chief of Engineers and authorized by the Secretary of War.

Your Honors asked yesterday as to the findings of the trial court. Very briefly, they are these—and the findings are in the record: That this diversion at Chicago did result in a lowering of the levels of the Great Lakes and their connecting waters. That this diversion would constitute and did constitute an obstruction to the navigable capacity of the Great Lakes. That the defense of sanitation was untenable, and those portions of the answer setting forth the defense of sanitation should be stricken out and an injunction should issue.

Judge Carpenter rendered an opinion, which is also incorporated in this record, in which he says, "I have read this entire and I am in complete accord with what Judge Landis found."

Now, we get back in this case to Section 10; and counsel for the Sanitary District has sought to find an affirmative authorization by Congress.

They have told your Honors that there is no statute covering the Chicago diversion; that is stated by both counsel who have addressed the Court thus far.

And they have called the attention of your Honors to the Niagara Falls Act of 1906, a piece of legislation directed primarily to the necessity of the preservation of scenic grandeur, and to protect against further depletion of the Falls. They call attention to that act and tell your Honors that Congress indicated by that enactment of that law an intention to legislate specifically, and that the general legislation of March 3, 1899, is not effective.

Now, in that connection, I want to call attention very briefly to the *Rio Grande* case, for this reason: It sets forth the definition of what constitutes an obstruction within the purview of this act.

The court, after calling attention to section 10 of the act of 1890—and by the way, that is identical with this act, so far as the particular section is concerned, except that it says, "authorization by Congress" in the act of 1899; and an "authorization of law" is required by the act of 1890.

Referring to section 10 the court said:

> "As this is a later declaration of Congress, so far as it modifies any privileges or rights conferred by prior statutes, it must be held controlling, at least as to any rights attempted to be created since its passage; and all the proceedings of the appellees in this case were subsequent to this act. This act declares that 'the creation of any obstruction, not affirmatively authorized by law, to the navigable capacity of any waters in respect to which the United States has jurisdiction, is hereby prohibited.'
>
> "The language is general, and must be given full scope. It is not a prohibition of any obstruction to the navigation, but any obstruction to the navigable capacity; and anything, wherever done or however done, within the limits of the jurisdiction of the United States, which tends to destroy the navigable capacity of one of the navigable waters of the United States, is within the terms of the prohibition."

I will read just one sentence from the *Economy Light & Power Co.* case.

Mr. Justice Holmes: Do you mean that case in 256 U. S.?

Mr. Fleming: Yes, sir.

> "But as recognized in the *Gilman* case, 3 Wall. 713, Congress may exercise its authority through general as well as through special laws, the power in either case being supreme. The act of 1899—"

The act under consideration—

> "Is a due assertion of the authority of Congress over all of the navigable waters within its jurisdiction, and it must be accorded full weight."

We cited other cases in our brief upon the same subject.

They seek to tie themselves to the two old acts of Congress, the act of 1822 and the act of 1827, and invoke those statutes as a justification for their proceedings here—for the construction of the canal and the diversion at Chicago. Just a word or two, if your Honors please, with respect to that:

The act of 1827 provided that the canal should be commenced within five years and completed within twenty years. Three years later, if your Honors please, as showing the purpose of Congress, the Congress passed an act authorizing the State of Illinois to construct a railroad between the points in question, showing conclusively the purpose Congress had in mind.

This matter was before Secretary Stimson and he covered the situation in his opinion of January 8, 1913, finding that the only purpose was the purpose of navigation and that sanitation was not considered.

One thing more: That act, if your Honors please, provides for the creation of a particular canal the location of which was to be determined by law, and was subsequently determined. It is not claimed here by appellants that the canal they constructed is within the ninty-foot zone reserved on either side of the old forty-five-foot canal. This canal is a distinct, separate proposition. An authorization from Congress to construct a bridge across the Ohio River at a certain point is not an authorization to construct two bridges a mile apart.

They told your Honors yesterday and they told your Honors again this morning, that the old Illinois and Michigan Canal has been abandoned and replaced by the new one. They say "We have built another canal alonside the old one."

Now, what are the facts? If your Honors please, on July 1, 1919, the State of Illinois passed this act, which I am going to quote briefly. This act became effective on July 1, 1919; and section 3 of the act—and by the way, the Sanitary

District of Chicago has its own board of trustees elected by the people. They have jurisdiction over their canal—the Sanitary and Ship Canal; the other canal is under the control and direction of a State board.

Section 3 of this act of 1919 reads as follows:

> "The Department of Public Works and Buildings of this State is authorized and directed to protect against and prevent encroachments upon said Illinois and Michigan Canal, throughout its entire course as originally constructed, and to preserve its navigable capacity throughout the entire course. And it may, when the permission of the Federal Government is obtained, change and improve said canal and provide terminal facilities. No permission heretofore or hereafter granted which results in the obstruction to navigable capacity of any portion of said canal, or interferes with its use for any of the purposes herein named, shall operate in any way to deprive the State of Illinois of its rights."

The only right, if your Honors please, that the Sanitary District has in that canal is to cross it at certain portions, the portions specified. Their contention in this respect was disposed of likewise in the *Rio Grande* case. They raised a similar contention there, if your Honors please; and the Court answered that contention there.

One thing more: That canal was for the purpose of navigation, and not sanitation. And the record shows, if your Honors please, that 1,000 cubic feet per second is adequate for all transportation or navigation purposes. That is the finding, too, of Secretary Stimson.

There is nothing, if your Honors please, in this record, showing that the Sanitary District has any right under the act of 1827. The State of Illinois has not conferred any right upon them. The Illinois Legislature, in the enactment of the law to which I called attention, effective July 1, 1919, negatives any such delegation.

Mr. Kirby told your Honors this morning that the works constructed by the State of Illinois affected only waters within the State of Illinois, if I understood him rightly.

The fact is that the Chicago diversion is equal to the contribution of all the tributaries of Lake Erie; it is five per cent of the volume of water which passes over Niagara. It is five per cent of the total contribution of Lakes Michigan, Superior, Huron and Erie. Is not that fact, in and of itself, sufficient to show a "modification of the condition, course, and capacity of the navigable waters of the United States?" Now, if your Honors please, the evidence in this case is replete as to the effect upon the Lake levels; the reports of governmental committees and official bureaus have been presented in evidence; there are the reports of the International Waterways Commission; there are two reports—

Mr. Justice McReynolds (Interposing): Mr. Counsel, how far have we got to look into that question of fact? What is your case really bottomed upon here? Is it not bottomed upon the right of the Secretary of War to control this situation?

Mr. Fleming: Yes, your Honor.

Mr. Justice McReynolds: Now, could the Sanitary District go behind his decision?

Mr. Fleming: No. That is our contention. We contend that in our brief as well.

Mr. Justice McReynolds: I am trying to see, then, what we have got to do with the question of fact as to whether the water in the Lake is lowered or whether it is not; that is the thing I would like to have you enlighten me upon.

Mr. Fleming: Well, I do not know; but in the light of the inquiries propounded by your Honors this morning, I thought I had better discuss that question.

Mr. Justice McReynolds: Well, I want to know what we have to do with that question? Well, is it not your conten-

tion that the Secretary of War prohibited this thing, and had a right to prohibit this thing?

Mr. Fleming: Yes.

Mr. Justice McReynolds: And suppose the Secretary of War had taken no action at all: Would that make any difference?

Mr. Fleming: Yes. Independently of that statute, your Honor, the Government had a right to protect the navigable waters of the United States.

Mr. Justice McReynolds: Without any statute?

Mr. Fleming: Independently of any statute.

Mr. Justice McReynolds: But does the United States set up that right here in this suit?

Mr. Fleming: Oh, no; this proceeding here is predicated upon section 10 of the act of 1899.

Mr. Justice McReynolds: Well, is not that your whole case?

Mr. Fleming: We have a bill here which covers the situation independently of the statute, in my judgment.

Mr. Justice McReynolds: What do you mean by "a bill here"?

Mr. Fleming: We set forth the impairment of the navigability of the Great Lakes, by withdrawal of the water at Chicago—a situation which would warrant relief to the Government, independently of the statute—no, answering your inquiry further—

Mr. Justice McReynolds (Interposing): Is that the ground upon which the United States is proceeding here?

Mr. Fleming: No; we are proceeding, if your Honor please, on the theory that there is an obstruction to the navigable capacity of the Great Lakes, "without affirmative authorization of Congress"; that the "course, and condition" of cer-

tain navigable waters of the United States have been altered and modified—

Mr. Justice McReynolds (Interposing): Yes; but we have to decide this case upon the issues that you have raised.

Mr. Fleming: Those are the issues.

Mr. Justice McReynolds: And I was trying to see whether you have asserted the broad power of the United States irrespective of any statute?

Mr. Fleming: No, we do not. We argue that in our brief, but we have not put that in the pleadings. Our bill is predicated upon section 10 of the act of March 3, 1899.

The Chief Justice: As I understand your argument, it goes to the point that, even if the objection of the act of 1899 does not apply in giving a remedy by injunction, you still have that remedy growing out of the relations between the parties?

Mr. Fleming: Yes; and this Court has so held in the *Wheeling Bridge* case, to which the Solicitor General has referred; and we cite numerous other cases in support of that proposition. Independently of that statute, we have that right.

Well, I will not present any further reports or proofs or excerpts from the records in connection with the elevation of the lake levels, nor in connection with the injury to navigation, unless your Honors will so indicate. I have here excerpts from reports showing injuries to navigation, as testified by witnesses and found by commissions; but unless your Honors so indicate, I will not refer to them further.

Mr. Justice Holmes: You have cited them in your brief, have you not?

Mr. Fleming: We have cited them in our brief.

One word, then, with reference to the current, the excess current in the Chicago River: Counsel have told your Honors that no evidence was presented in regard to the current

in the Chicago River until after the evidence was in; that it was plainly an afterthought. Mr. Kirby told your Honors this morning that the proof was conclusive that there was no current in the Chicago River injurious to navigation.

Now, what are the facts? The bill involving the Chicago River was filed on October 6, 1913; and the bill in the Calumet River suit was filed on March 23, 1908. And this testimony showing the excess current in the Chicago River was presented on April 8, 1914. And that testimony, if your Honors please, is unanswered in this record. The testimony with respect to the excess current in the Chicago River was that of ship captains and navigators, men who traversed the Lakes and the Chicago River for years. Their testimony was that the current was from two to six or seven miles per hour—something away beyond what has ever received the semblance of permission of the Secretary of War.

They all testified to the prejudcial effect upon navigation; that it was exceedingly difficult and dangerous, in view of that excess current, to navigate the Chicago River. We set forth the details of that testimony on page 115 of our brief —commencing there.

They call your Honors attention to governmental reports and surveys. They call attention to the fact that fifteen different acts of Congress have recognized this canal; that appropriations have been made for investigation. And each and every one of those contentions have been answered in the *Wheeling* case—and by the way, the *Wheeling* case is a complete answer to each and every contention raised in this case. We do not need to go further than the citation of that case.

The testimony shows, if your Honors please, in the first branch of the case, namely, the obstruction, that there has been a lowering of the levels of the Great Lakes; that that reduction amounts to five or six inches. Secretary Stimson found six and nine-tenths inches, if I am not mistaken. But

there has been a lowering of the levels of the Great Lakes, due to the increase of current in the Chicago River.

Those two propositions constitute an obstruction to the navigable capacity of the waters involved. We do not need to show an obstruction under this statute. The language is comprehensive. All we need to show is a modification. And we have shown, as the record shows, the creation of a large navigable stream flowing away from Lake Michigan and discharging its waters into another watershed.

The record shows a change in the condition of the Illinois River and the DesPlaines River—plainly a change in the condition of these navigable waters of the United States. The case is determinable, as Mr. Beck said, on the pleadings, without reference to the proof.

Congress enacted in 1890, and again in 1899, these acts; and the ultimate question is, have the acts of appellant been permitted, or have they been done pursuant to Federal laws? The record establishes conclusively, if your Honors please, that they have not.

In *Missouri* v. *Illinois,* to which counsel alluded yesterday, this Court said:

> "It is a question of the first magnitude whether the destination of the great rivers of the United States is to be the sewers of the cities along their banks. Obviously, of far greater magnitude, is the question whether the waters of the Great Lakes are to be subject to the unrestricted depletion by the States and cities, without regard to navigation purposes, and whether the once paramount right of Congress over navigation is to be made subordinate to the claims of the States."

Now, in view of the record in this case, if your Honors please,—and there is not any controversy about the lowering of the level, but the only controversy is about the extent of the lowering; the only thing as to which there is any dispute in the evidence, is as to the extent—we submit that we are entitled to an affirmance of the decree.

Closing argument of Edmund D. Adcock, Esq., on behalf of appellant.

Mr. Adcock: If the Court please: In the time left at my disposal, it will be impossible for me to take up every point that has been argued here in opposition.

The Chief Justice: You only have about ten minutes left.

Mr. Adcock: Yes. I submit that our reply brief takes up, I think, in consecutive order, the arguments made in the brief of the Government.

There are one or two things to which I would like to call the Court's attention.

It seems to me that the fundamental proposition here is the question of the State's power, in the absence of any act of Congress occupying the same field. That is the whole question. And that until Congress acts, then this power, which is in the interest of public health and under the police power, remains. And we are not denying the right of Congress specifically to legislate upon that subject.

Mr. Justice McReynolds: Well, before you finish, I wish you would tell me, if you do not mind, what kind of decree you would like to go down to the court below, if this judgment is affirmed?

Mr. Adcock: If I may have the opportunity to do so.

Mr. Justice McReynolds: Yes, I just suggest that to you.

Mr. Adcock: We stand upon our fundamental rights that the action of the State of Illinois here providing for the protection of the Health of its citizens, is absolutely valid until Congress has acted. And when it does act, it must act in those plain and unmistakable terms—

The Chief Justice (Interposing): Then your contention is that the enlargement of the diversion to 10,000 cubic feet a second was lawful?

Mr. Adcock: Absolutely lawful.

The Chief Justice: And is still lawful?

Mr. Adcock: And is still lawful. And that section 10 of the act of 1899 does not in those terms forbid it—in the terms that are required in order to forbid the action of the State—

Mr. Justice Holmes (Interposing): Your contention might involve this: Do you not think that if the State of Illinois has the power to enlarge it, some other State would have the power to take water in the same way?

Mr. Adcock: If the Court please. That is not the issue in this case.

Mr. Justice Holmes: I am quite aware that that is not the issue; but I was speaking of the breadth of your statement.

Mr. Adcock: Our contention is that, so far as the United States is concerned, so long as the State of Illinois is acting reasonably in the interest of its public health, then that action remains lawful, unless Congress has clearly and unmistakably stated its intention otherwise.

Mr. Justice Sutherland: No matter how much it interfers with navigation?

Mr. Adcock: So long as it is reasonable. In the case of *Hennington* v. *Georgia,* the court sustained the action of the State against the operation of trains on Sunday, both interstate as well as others. The *Covington Bridge* case, to which counsel refers, involved the fixing of tolls over a bridge directly operating upon interstate commerce.

We are not acting in defiance of the United States so far as commerce is concerned. We are acting within the sphere of our powers; and until Congress under the commerce clause forbids us, our action is lawful.

And not only has it not forbidden us, if your Honors please; but it has taken action which clearly recognizes this diversion; it has taken such action from the very time that this act was passed; and when the Sanitary District expressed its purpose to occupy the Chicago River for this supply channel,

Congress immediately provided for the improvement of the Chicago River in connection with appellant's improvement of the South Branch and the West Fork. On April 1st—

Mr. Justice VanDevanter: Well, there would not have been any objection to your doing that anyway?

Mr. Adcock: It was what we were working for.

Mr. Justice VanDevanter: But there would not have been any objection to your doing that?

Mr. Adcock: The only corporate purpose that we had in doing that was in order to make that channel—in order to take that water through there; we had no other corporate power. And it was done right along.

And the very act, if your Honors please, which contains this section 10 contains in another section an item with reference to the Chicago River under which *Tunnel Cases* were decided, making a project depth of twenty-one feet, on condition that the local authorities should reconstruct the bridges and lower the tunnels at their own expense; and this court said that they meant in that case to give the congressional assent. The tunnels were removed, and it was held that the consent of the Secretary of War was unnecessary. We reconstructed the bridges that were expressly provided for in that act. We did also the excavation to deepen the channels, and to widen the channels.

And this court said, in *Missouri* v. *Illinois*, where this very diversion was involved, and where the question was the effect upon the Mississippi River:

> "In the case at bar, whether Congress could act or not, there is no suggestion that it has forbidden the action of Illinois."

And I refer you also to a case involving this very proposition, which I have mentioned before—this very permit—an opinion by Mr. Justice Baker, in our Circuit Court in the case of *Corrigan Transit Company* v. *Sanitary District*, 137

Federal Reporter; and I respectfully call the Court's attention to the Niagara Falls act, to the Burton act; and I do not believe that there is a possibility of reading that act without coming to the conclusion that what they intended to say there was that they had not given the Secretary of War authority to fix the quantity of diversions from the Great Lakes, and that they were not going to do so, but that that was something that might be taken up in the future. And there was no occasion to pass that act with reference to Niagara Falls, if the Secretary of War had the authority.

Counsel has referred to water power. There is not a syllable upon this record upon which it can be stated that this great work was done for the purpose of obtaining water power. It was not until 1903 that an act was passed specially containing the provisions with reference to the development of this power which would be incidentally created; and it would have been perfectly criminal for us to have gone ahead and used the water for sanitation purposes that was absolutely necessary, without using the power that had been going to waste and would go to waste unless we harnessed it up.

Now, Counsel has had much to say about the suit that was filed March, 1908, and I want to submit to your Honors, in that connection, that the contention in that respect is exactly the opposite of what counsel for the Government claims; and the necessary result or construction of what happened is exactly the opposite of what counsel claims. For in that case the Attorney General when he brought the suit only asked for an injunction against doing or attempting anything in any way "to reverse the flow of the said Calumet Rivers, and from doing or attempting anything in any way to divert or abstract any waters from Lake Michigan in any channel other than the Chicago River as already authorized by the Secretary of War, unless prior to beginning any of said work".

Now, what was the situation with reference to permits at that time? The Secretary of War and the Chief of Engineers, in construing this whole proposition, assumed that the only thing they had to do with was the question of the current in the Chicago River and how we would get this water from Lake Michigan to our channel. That was the engineering proposition.

So that the only condition that they ever placed upon us was with reference to the current in the Chicago River.

Now, what did we do? We have complied with the conditions of the May 8, 1899 permit—

The Chief Justice (Interposing): I do not understand you.

Mr. Adcock (Continuing): By improving the river so that there is no current in the Chicago River obstructive to navigation—

The Chief Justice (Interposing): Well, did the permit refuse you permission to use the Calumet River?

Mr. Adcock: The Calumet River is not involved, your Honor.

The Chief Justice: I know; but it is there, is not in the suit of 1908? Is it not referred to there?

Mr. Adcock: Yes. If I may, I will just continue and carry that point through:

At that time, we had a War Department permit of July 11, 1900, to improve and enlarge the Chicago River so as to get a greater quantity through. That is, the work of deepening the river from seventeen to twenty-six feet and widening it, etc., was then authorized by the Secretary of War. The work was under way. The *Tunnel Case* was not decided until 1906. The work of deepening and widening the river was not completed until 1912.

Now, on September 11, 1907, when we got a permit for the North shore channel, there was a condition that the taking

of water should not exceed what was given by other War Department permits. It was necessarily assumed that when we had completed that improvement of the Chicago River, the permit or the right—the thing that would follow from that, namely, taking the water through, would be completely authorized.

So that, when the June 30, 1910, permit was issued, there was a condition that it should not exceed 4,167 cubic feet a second; and the purpose of that limitation was that, if they gave us that permit, we would not have any more than we had right to take through the Chicago River, because that proposition was in litigation.

And there was also in the permit a condition that it should not be used in litigation. In other words, it was a case of having a *modus vivendi*—due to a feeling that the channel had to be constructed. And there was a suggestion in General Bixby's report that that additional amount should be taken through there in order to relieve the Chicago River, so as not to get too much through that river. So that that was one of the reasons.

So that after that permit was given under those conditions, the only question was as to the legality of the taking of the 10,000 cubic feet a second through the Chicago River. And it was not, I submit, until Secretary of War Stimson's opinion of 1913 that we had any idea or information—and the record shows that—that that amount would not be allowed through the Chicago River.

So that there was no delay. Judge Landis stated that the testimony on that proposition had occupied some time; and after 1910, the only thing involved was the right under the suit instituted in 1913; and the testimony, after we found that question was raised, was taken in 1913 and 1914; and the record does not disclose a single action taken by the Sanitary District to delay any of the litigation.

Now, as to the treaty proposition—have I over-stepped my time, your Honor?

The Chief Justice: Yes, you have.

Mr. Adcock: I beg the Court's pardon. Unless you will give me just a little more time—

The Chief Justice (Interposing): I cannot give you any more.

Mr. Adcock: Well, I am sorry to have done that. But I just submit that our reply brief does cover these different points consecutively.

(Thereupon, at 3:50 o'clock p. m., the Court proceeded to the consideration of other business.)

PAGES

UAL ISSUES BEFORE THE COURT.....15, 16

UMENT.....23-72

I. Principles governing conflict of sovereignty....23-29
Illinois sovereignty.....24-97
The power of the United States.....27-29

II. In the exercise of its sovereignty, before Congress had acted at all, Illinois has continuously since 1848, lawfully diverted water from Lake Michigan.....29-31

II. This exercise of power by Illinois had the sanction and approval of Congress long before the canal was built.....31-36
The Acts of 1822 and 1827 evidence the aid and approval of Congress to this exercise of state sovereignty.....32-35

V. The bills are not based on any claim that Illinois has substantially or unreasonably interfered with interstate commerce, but exclusively on the contention that without the Federal consents prescribed in Section 10 of the Act of 1899, any diversion is unlawful.....36-39
Analysis of theory of the bills.....38, 39

V. Section 10 of the Act of 1899 was not intended to be retroactive.....39-41

VI. By Section 10, of the Act of 1899, Congress did not attempt to declare this particular diversion unlawful, or to take such exclusive jurisdiction as to render unlawful all obstructions not specifically authorized by the Federal consents prescribed in the act.....41, 42

VII. The fact that Congress by the Niagara Falls Act of 1906, prohibited diversions from the Niagara River, indicated that such diversions were not prohibited by the Act of 1899.....43-45

VIII. To sustain the decree, Section 10, of the Act of 1899, must be construed to grant to the Secretary of War unlimited power to permit or refuse the creation of constructions to navigation. The act cannot be so construed.....45-51

(1) The power conferred by the act upon the Secretary of War was administrative and not the power to decide broad questions of public policy either legislative or judicial in nature.....46, 47

(2) In attempting to limit appellant's diversion the Secretary of War necessarily assumed power 47-51

(a) To make inoperative a valid exercise of the police power of Illinois 47-49

(b) To deny to the Illinois and Mississippi Rivers water needed for effective navigation, and thus to decide as between the interests of the Great Lakes and the Mississippi Valley 49

(c) By substantially reducing the flow of the two rivers, to greatly increase the cost of maintaining channels from the Lakes to the Gulf 50

(d) By permitting the diversion actually authorized, to that extent, to lower Lake Levels and affect rights claimed by citizens of Canada 50, 51

IX. (1) Such a delegation of power would have been unconstitutional because Congress failed to furnish any principal pursuant to which the Secretary of War should exercise such power.....51-53
(2) If such power had been properly delegated the manner provided for its exercise is not "due process," as the rights of these *amici curiae* were given no consideration.....53-57
X. Assuming the construction claimed for Section 10, of the Act of 1899, nevertheless, Illinois obtained the prior affirmative authority of Congress and the particular works were authorized by the Secretary of War and recommended by the Chief of Engineers.....57-62
(1) Appellant's Sanitary and Ship Canal had the prior affirmative authority of Congress.....57-61
(2) The particular works were duly authorized as required by the Act.....61, 62
XI. Contentions in the brief on behalf of the Lake States (*amici curiae*) either do not apply to the issues of this case, or are without merit..63-70
The theory of riparian ownership advanced by the Lake States is not the law.....63-67
Discussion of *Kansas* v. *Colorado*, 206 U. S. 46..66, 67
Discussion of *Missouri* v. *Illinois*, 200 U. S. 496. 68
The Lake States brief shows their real interest is the desire for additional profits from the development of power at Niagara.....68-70
XII. Without regard to questions of law the relative equities in the instant case require a reversal of the decree.....70-72

BRIEF OF POINTS AND AUTHORITIES.....17-2
HISTORY OF WATER ROUTE..... 4,5
RECENT DEVELOPMENTS IN WATERWAY TRANSPORTATION.... 5,1

IN THE

Supreme Court of the United States

OCTOBER TERM, 1924.

No. 161.

THE SANITARY DISTRICT OF CHICAGO,
Appellant,

vs.

UNITED STATES OF AMERICA,
Appellee.

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES, FOR THE NORTHERN DISTRICT OF ILLINOIS.

BRIEF ON BEHALF OF THE STATES OF ILLINOIS, MISSOURI, LOUISIANA AND TENNESSEE, AND OF THE CHAMBER OF COMMERCE OF ST. LOUIS, THE MEMPHIS CHAMBER OF COMMERCE, THE NEW ORLEANS BOARD OF TRADE, THE NEW ORLEANS ASSOCIATION OF COMMERCE, THE MISSISSIPPI VALLEY ASSOCIATION AND THE CHICAGO ASSOCIATION OF COMMERCE, AS AMICI CURIAE, TO OPPOSE THE AFFIRMANCE BY THIS COURT OF THE DECREE BELOW; FILED BY LEAVE OF COURT.

INTRODUCTION.

This case involves a conflict between the sovereign power of Illinois and that of the United States, the decision of which is vital to the inhabitants of Chicago, and of vast importance to the people and commerce of the Mississippi Valley. It does not involve any issue between states, nor between any state and appellant.

The above named amici curiae are interested in the issues in the above-entitled cause, and are prejudiced by the decree below, in respect of navigation and of sanitation.

Navigation: All of these states and commercial bodies are interested in the preservation and development of the navigable channel that has long constituted a public highway or water route between Lake Michigan and the Gulf of Mexico,—consisting of the Chicago River that opens into Lake Michigan, the Sanitary and Ship Canal of Appellant linking the Chicago River with the Des Plaines and Illinois Rivers, and the Mississippi River.

For the adequate maintenance and operation of this water route, a diversion from Lake Michigan of at least ten thousand cubic feet of water per second is necessary, particularly in aid of that part of the route lying within the State of Illinois, and of that part of the route in the Mississippi Valley extending from the mouth of the Illinois River (about twenty-two miles above the City of St. Louis), to Cairo, Illinois.

The effect of the decree limiting the diversion to 4,167 cubic feet per second, would seriously impair and lessen the navigability of this existing water route.

The Mississippi Valley needs this water route first, for direct use at the low freight rates offered by all water or part water routes, and second, to furnish an available all water or part water route in competition with all rail routes, so as to reduce the competitive freight rates of the latter.

Sanitation: The effect of the decree, if enforced, would be to create a dangerous and intolerable public nuisance along this water route within the State of Illinois, because of the consequent inadequate dilution of Chicago sewage passing through this water way (Appts. Narr. St. pp. 190, 199, 200, 209, 377).

While the State of Illinois and its commercial interests,

are immediately and vitally interested in this feature of the case, the State of Missouri, particularly the inhabitants of St. Louis and of other Missouri communities along the Mississippi River, are also deeply concerned, and would be seriously prejudiced by the decree.

The danger that St. Louis and the State of Missouri expected from the Chicago sewage when Missouri sued Illinois in January, 1900 (about the time the present Sanitary and Ship Canal was being opened), 180 U. S. 208, 200 U. S. 496;—was prevented only because the quantity of water that has been diverted from Lake Michigan through the canal to dilute this sewage, proved to be adequate in quantity to dilute and purify the sewage. An insufficient dilution of this sewage, which would result from an enforcement of this degree, would inevitably create a public nuisance and spread disease, not only along this waterway within the State of Illinois, but also to the City of St. Louis and other Missouri cities and towns along the Mississippi River.

The States of Tennessee and Louisiana, while not materially interested in the question of sanitation as such, are interested in having this waterway throughout its entire length, maintained in sanitary condition for safe use, free from risk of disease, to those who use it in transporting freight and passengers.

STATEMENT OF FACTS.

To avoid unnecessary repetition, we adopt the statement of facts contained in the brief filed on behalf of appellant, and shall endeavor to state in this brief only such facts as seem essential to disclose the interests of these states and commercial bodies, and to support the contentions herein submitted on their behalf.

The "Continental Divide," or elevation of land separating the watershed of the St. Lawrence River from that of the Mississippi River, lies in the northeastern portion of Illinois, within the limits of appellant, a few miles from Lake Michigan. At its lowest part the Divide is only a few feet above the normal level of Lake Michigan.

Since the earliest time covered by local history, there was a natural navigable water route from Lake Michigan, across this Divide, into the Des Plaines and Illinois Rivers, and thence by the Mississippi River to the Gulf of Mexico (Appellant's Narrative Stat. 400, 403). In early days explorers followed this ancient waterway, and fur traders used the same route. There are records that during high water, a natural water connection existed between the Des Plaines River and the Chicago River within what is now the City of Chicago (Appellant's Narrative Stat. 407).

The existence of this water route led in 1818, to the inclusion within the new State of Illinois of what is now the northern portion of Illinois, together with a part of Lake Michigan. The object of this inclusion as stated in Congress was to gain a coast on Lake Michigan and thereby to connect Illinois, through the Lakes, with the States of Indiana, Ohio, Pennsylvania and New York; and it was also stated that:

> "The facility of opening a canal between Lake Michigan and the Illinois River, is acknowledged by every one who has visited the place. Giving to the proposed state the port of Chicago (embraced in the proposed lim-

its) will draw its attention **to the opening of the communication between the Illinois River and that place**, and the improvement of that harbor'' (App. Narr. St. 405).

The existence of this water route led to the beginning of the settlement at the mouth of the Chicago River, which was organized later as the Village of Chicago, in 1833, with an estimated population of three hundred and fifty (App. Narr. St. 265). This village grew into the present City of Chicago, and this growth was possible because favorable transportation facilities existed from the beginning, viz: the water route by the Great Lakes furnished easy access to other lake ports and to New York state; and the Des Plaines-Illinois River route furnished access to the growing State of Illinois and to the entire Mississippi Valley.

The existence of these water routes and the growth of the port of Chicago at their junction, led still later to the construction of many important railroads into Chicago, and made Chicago an important center of transportation by both rail and water.

In the early days of Illinois, transportation flourished on this water route, as it did on the Missouri and Mississippi.

But later, the rapid development of the Middle West and the resulting marvelous increase in its natural and manufactured products, stimulated the construction of a vast network of railroads that competed with each other, and paralleled and competed with these inland water routes. This extensive and intense rail competition, maintained under highly economic operating conditions, gradually overcame and lessened the water transportation, and discouraged the adequate maintenance of inland waterways, so that transportation over this particular waterway and throughout the Mississippi Valley, became reduced to a relatively small volume.

Then the World War threw its enormous burden of traffic upon the railroad transportation systems of the country,

which broke down under it, and in the light of their proved inadequacy, and of the large increase in freight rates that resulted from war and post-war increased operating costs, shippers again turned to the waterways for relief. Through this experience, the shipping world has come to see the folly of handling by rail heavy low-grade commodities, like grain, coal, lumber, ore, iron, etc., as to which quick delivery is not essential, and for which there may be available an all-water or part-water route with its substantially lower freight rates. So the value and need of our inland waterways has again become and is, a subject of live importance to the business world and to the Government.

During the War Congress recognized this need of inland waterways to supplement our existing railroad systems.

In the "Federal Control Act" ("An Act to Provide for the Operation of Transportation Systems while under Federal Control, for the just compensation of their owners, and other purposes," 40 Stat. L. 451), the President was specifically authorized (Sec. 6) to spend such amounts as he deemed necessary for the **utilization of waterways** and **the creation of water transportation agencies.**

In the "Transportation Act" of 1920, (41 Stat. L. 499), in Section 500, Congress declared it to be its policy: **"To permit, encourage and develop water transportation service and facilities** in connection with the commerce of the United States, and to foster and preserve in full vigor, **both rail and water transportation."**

And in the same Section it was made the duty of the Secretary of War, in aid of this policy of Congress, to investigate extensively and to report to Congress concerning all matters that might assist in the development of inland waterways.

And by Section 201, of the same Act, upon the termination of Federal control, all boats, barges, etc., **on inland waters,**

acquired by the United States pursuant to the Federal Control Act, were transferred to the Secretary of War" • • • who shall operate or cause to be operated such transportation facilities, so that the lines of inland water transportation used by or through the President during Federal control shall be continued, and assume and carry out all contracts and agreements in relation thereto, entered into by or through the President in pursuance of such paragraph, prior to the time above fixed for such transfer."

It was further made the duty of the Secretary of War under one of the specific provisions of this Section, to operate or provide facilities for water carriage on the Mississippi River above St. Louis.

Under these Acts of Congress, the Government created and is successfully operating a barge line freight service on the Mississipi and Black Warrior Rivers, known as the "Mississippi-Warrier Barge Line."

To further the development of this carrier, and to place it on a more stable basis, Congress passed the Act entitled, "An Act to Create the Inland Waterways Corporation, for the purpose of carrying out the mandate and purpose of Congress as expressed in sections 201 and 500 of the Transportation Act, and for other purposes," (Approved June 3, 1924.)

A corporation was formed to take over and continue this freight service and to "as soon as there is an improved channel **sufficient to permit the same**, initiate the water carriage heretofore authorized by law upon the Mississippi River above St. Louis." This corporation is controlled by the Secretary of War, who, under Section 3 (b) of the Act, shall not discontinue present facilities nor develop new lines without Congressional authorization therefor, though he may report recommendations concerning them.

That this Government owned large barge line has been and

is being successfully operated between St. Louis and New Orleans, is a matter of common knowledge.

By the creation and operation of this line the Government has provided a through freight service between St. Louis and New Orleans, and has demonstrated that such a service is practicable as a matter of navigation, and in competition with parallel rail lines. It has also proved to the farmers and producers of other natural products, and to the manufacturers and merchants, throughout the Mississippi Valley freight territories, that this ancient route to the seas, giving access to the markets of the world at water or part water freight rates, is sill available, practicable and economic. Its value and importance to the Mississippi Valley now and in the future, are limited only by the extent to which the Government is willing to maintain and make available these inland waterways.

In addition to these developments resulting from the proved inadequacy of rail transportation during the War, a further development has emphasized the importance to shippers in the Middle West, of improving water transportation on the Mississippi River and from the River to the Lakes.

The construction and operation by the Government of the Panama Canal and of Government owned sea-going freight vessels, opened the markets of South and Central America to the products of the Mississippi Valley, and also had a marked effect on the rail freight rates between the Middle West and points on the Atlantic and Pacific coasts. Until these developments, such limited water competition as existed, although important, had not had its full effect upon rail rates from coast to coast, and between coast points and the Middle West. But these developments caused a large volume of coast to coast traffic and of Middle West to coast traffic, to move wholly or partly by water routes and thus to be diverted from the rail lines. Coast to coast rail rates had always tended to

be lower than the combination rail rates to and from Middle West points, and this fact caused a constant conflict between the desire of the coasts for low transcontinental rail rates and the desire of the Middle West to obtain combination rail rates no higher than the coast to coast rail rates. This conflict resulted in much litigation regarding such rates, also in frequent amendments of the Long and Short Haul clause (Sec. 4) of the Act to Regulate Commerce; and another effect was to make the rail rates more inflexible and less capable of adjustment to meet changing commercial conditions.

Since the existence of an available water route to the Gulf constitutes today the only effective regulator of long haul rail rates, this Mississippi Valley waterway, having a connection (via Appellant's canal) with Lake Michigan, and an outlet via the Missouri River for the products of the vast territory traversed by the Missouri, and having large additional territories tributary to the upper Mississippi, the Ohio River and each of the navigable rivers that empty into the Mississippi south of Cairo, Illinois, is today a vital factor in the transportation facilities of the United States.

The shippers and receivers of freight throughout this important part of the United States, whose businesses developed on a practical equality of transportation cost with their seaboard competitors, are now suffering serious disadvantages in competing with other parts of this country and in foreign trade, because of adverse rail rates to the sea. The recent improvement by the Government of water transportation facilities in the Mississippi Valley and its declared purpose to improve inland waterways generally, alone promises relief.

It has also opened wide the door of reasonable hope and expectation, that this historic route from the Lake to the Gulf, and the Mississippi River itself, will not be made less

navigable than at present, but will be improved and enlarged in navigable capacity, so as to forever and effectively "unite the waters of Lake Michigan with those of the Illinois River," for the use of deep draft barges and other freight bearing vessels, suitable for modern navigation, and for the transportation of large volumes of freight in competition with modern freight trains.

The volume of water (10,000 cubic feet per second) that has been and is now being diverted through appellant's canal into the Mississippi River, constitutes a substantial portion of the river between St. Louis and Cairo during low water seasons.

By Act of Congress, March 2, 1907, (34 Stat. L., p. 1073) a special Board of Engineers was created, who made a survey of the Mississippi River from St. Louis to the Gulf. This Board reported to the Secretary of War, June 7, 1909, and their report is Document No. 50, Sixty-first Congress, First Session. This report shows that at low water stage, the Mississippi River from St. Louis to Cairo has a flow of only 33,000 cubic feet per second, including the water diverted from Lake Michigan, and that this addition of 10,000 cubic feet per second adds one and one-half feet to the depth of this part of the river during the low water months. At high water, the maximum flow at St. Louis was 1,146,000 cubic feet per second.

It is a matter of common knowledge that this part of the Mississippi River is difficult to navigate at low water because of numerous shifting sand bars and a shallow, shifting channel; and the above facts from the Engineers' Report show how substantial a part of the river during low water months is the water diverted from Lake Michigan, and how necessary it is to the maintenance and operation of this waterway.

Various depths (twenty-four, fourteen and nine feet) for this Lakes to the Gulf deep waterway, have been considered by the Government, by the State of Illinois and by others

interested. The public demand for a twenty-four foot channel and its desirability, were so potent that the improvement of the Chicago River and the construction of the main channel of the canal for a distance of thirty-six miles from Lake Michigan, to within a mile or two of Joliet, Illinois, were completed with a depth of twenty-four feet; (Appts. Narr. St., p. 296).

This provided a much greater navigable capacity than would have resulted had the canal been built merely for adequate sanitation purposes. For merely sanitation purposes it could have been built **"for only a fraction** of the cost that was necessitated in building a channel of the present dimensions, in order to fit it for navigation." (Appts. Narr. St., p. 391.)

Below Joliet (beyond the jurisdiction of the Sanitary District) the State of Illinois is constructing improvements and has asked the Government to co-operate to create a preliminary depth of fourteen feet to the Mississippi (230 miles), to be further deepened progressively as the need of navigation may require (Appts. Narr. St., p. 297), and the waterway now actually under construction is required by the Illinois Act to be of a depth of not less than 14 feet over mitre sills.

To maintain such a fourteen-foot channel through the State of Illinois, a diversion of 10,000 cubic feet per second is essential. (Appts. Narr. St., p. 298.) The Illinois Act of 1889, creating the Sanitary District, contemplated a depth of at least fourteen feet with a diversion of 10,000 cubic feet per second. (Appts. Narr. St., p. 298.) This plan was advocated by the Lake to the Gulf Deep Waterways Association, and Congress made a conditional appropriation to begin the work whenever an understanding should be reached with Illinois regarding a plan of co-operation. (Appts. Narr. St., 299.)

The Report of the International Waterway Commission

upon the Chicago Drainage Canal, Jan. 4, 1907, (App. Nar. pp. 505 to 529), states (p. 512):

> "It can hardly be doubted that the canal will eventually form a part of an improved waterway between the Great Lakes and the Mississippi River, though its full depth will probably not be required for that purpose. Congress has not adopted any scheme for this improvement, but by its direction a survey was made, and plans with estimates for a waterway fourteen feet deep were submitted, by a Board of Engineers in a report dated Aug. 26, 1905. The Board found that for a distance of about 100 miles from Chicago the improvement must be with locks and dams and as the quantity of water required would be merely that needed for the service of locks and other incidentals, the extent of the improvement of depth which would be obtained in that part of the route was without limit so far as it depended upon the amount of water available. For the remaining distance, about 223 miles, the improvement would be an enlargement of the open channel and the degree to which it was practicable was entirely dependent upon the quantity of water flowing. The Board assumed that the Chicago Drainage Canal would eventually be permitted to take 10,000 cubic feet per second from Lake Michigan, and it expressed the opinion that with that volume added to the natural low water discharge of the Illinois River, a depth of fourteen feet in the open channel could be maintained; also that if a much greater depth was to be secured, a much larger volume of water must be taken from Lake Michigan."

That improvement of navigation in the Illinois River depends on the volume of flow from Lake Michigan, is further shown by the following references to Appellant's Narrative and the documents there quoted: Letter of Division Engineer of Chicago (May 24, 1921; App. Narr, p. 50; Report of Col. Macond, Jan. 25, 1875; App. Nar. pp. 419-420; Report of Capt. Marshall, U. S. Division Engineer of Chicago, 1895 Appr. Narr. 463.

While the plan for a fourteen-foot channel seems to be the one generally accepted and favored as desirable to be accomplished,—the actual work being done by the Government

as shown by Rivers and Harbors Appropriation Acts, has been for the present maintenance of channel depths of: nine feet from the mouth of the Mississippi to the mouth of the Ohio; eight feet from the mouth of the Ohio to the mouth of the Missouri, and six feet from there to Minneapolis.

Since the low water flow between St. Louis and Cairo is only 33,000 cubic feet per second (as stated above), it appears that the 10,000-foot diversion from Lake Michigan constitutes at such critical times almost one-third of the Mississippi River between these points.

From the beginning, Illinois has assisted Chicago to utilize the peculiar advantages of its natural location in protecting its water supply and taking care of sewage, by diverting water from Lake Michigan.

The original plan for the construction of the Illinois-Michigan canal contemplated a flow by gravity from Lake Michigan. Owing to lack of funds this plan was not carried out but from the beginning water for the canal was obtained from Lake Michigan by pumping works. In the report made pursuant to provisions of the Rivers and Harbors Act of 1902 (App. Narr., p. 498), the history of this matter is summarized as follows:

> "Besides being a highway of commerce, the Illinois and Michigan Canal has from the beginning served to carry off the sewage of Chicago. The Chicago River has always been the main receptacle of the sewage of the City, and as the volume of the sewage has increased with the growth of the City, additional facilities for discharging it into the Canal have become necessary. When the Canal was opened in 1848, a pumping plant was established at Bridgeport, where it joins the Chicago River. In 1860, the capacity of this plant was nearly doubled, being increased to about 400 cubic feet per second. Later on the summit level of the Canal was cut down so as to provide a continuous gravity flow from the Chicago River and Lake Michigan. That work was completed in 1871 and the pumping plant abandoned. In 1883, a new pumping plant was brought into use, having a nominal

> capacity of 750 cubic feet per second, but it soon became evident that the discharging capacity of the old canal was quite inadequate to carrying the volume of water required to dilute the sewage, and that a new and greatly enlarged channel must be provided."

Cooley testified that when the Illinois and Michigan Canal was opened to gravity flow it had an estimated capacity of 40,000 cubic feet per minute, which declined due to a decline in lake levels to 20,000 feet per minute. Pursuant to a resolution of the Legislature in 1881, the City of Chicago erected pumping works with the capacity of not less than 60,000 feet per minute. (App. Narr., pp. 272-273.)

Chicago, from the beginning, properly availed itself of the advantages of its natural location. The present canal, therefore, is merely the final development of an historic plan.

In view of the Lake States' claim of damage to their navigation interests, the evidence which disproves the existence of any such damage should be noted.

The testimony on this point is uncontroverted. Joseph Ripley, one of the United States engineers, described in detail the basis upon which navigation improvements in the Great Lakes are made. (App. Narr., p. 154.) In the Acts of Congress making appropriations for navigation improvements, navigable depths are fixed in relation to what is known as a "reference plane," *i. e.*, a plane (or level) fixed by the Engineers at a certain definite number of feet and inches above sea level. Navigable depths are fixed by the Acts of Congress at so many feet below the reference plane. The testimony shows plainly that reference planes for navigation improvements in the Great Lakes were, in 1901 and 1903, reduced from six feet to a foot or more in order to allow for the lowering of the levels of the Great Lakes anticipated by the engineers to result from the Chicago and other diversions. This testimony demonstrates that the depths provided by Congress in improving navigation in the Great

Lakes were in fact produced to the full extent contemplated. For instance, in spite of the claimed lowering of the Lakes, where a 21-foot project was desired by Congress, dredging took place to such an extent that 21 feet was obtained after the lowering of lake levels had occurred.

THE ACTUAL ISSUES BEFORE THIS COURT.

In view of the extensive scope of the claims made in the brief for the Lake States, and of the numerous points presented in the briefs of the parties to this record, it is particularly important to keep in mind the **exact nature** and **very limited scope** of the issues presented in this appeal.

In this case the Appellant is enjoined by the decree "from diverting or abstracting any water from Lake Michigan * * * **in excess** of 250,000 cubic feet per minute," *i. e.*, 4,167 cubic feet per second. (Appts. Narr. St., p. 117.)

The bills rest the entire case for the Government on the theory that Section 10, of the Rivers and Harbors Act of March 3, 1899, renders unlawful the Appellant's works and the resulting diversion, because:

(a) The diversion of water from Lake Michigan creates "an obstruction to the navigable capacity" of the Great Lakes; and

(b) Under Section 10, of the Rivers and Harbors Act of March 3, 1899, no obstruction of any kind or degree can be created without the consent of Congress and the permission of the Secretary of War;

(c) Congress has not authorized this diversion, and the Secretary of War has permitted Appellant to thus divert **only** 4,167 cubic feet per second; and that therefore

(d) **All diversion in excess of said quantity is unlawful.**

It thus appears that this entire case rests upon Section 10 of the Act of 1899, and that the decree must fall unless it can be justified under this Act.

The above statements accurately summarize the averments of the bills on the points involved.

This is not a suit in equity to abate an alleged nuisance. It is not an original proceeding before this Court by the Lake States against Illinois to determine whether Illinois, as part owner of Lake Michigan, is making an inequitable or unreasonable use of lake waters, thereby causing substantial injury to the navigation interests of the other Lake States. It is not even a suit by the Government to abate this diversion at Chicago on the ground that it constitutes a substantial injury to navigability. Nor does the Government sue as a trustee for the benefit of the Lake States or the people.

The above analysis of the bills and decree shows that the single issue upon this appeal is **whether Section 10, of the Rivers and Harbors Act of March 3, 1899, renders unlawful any diversion in excess of 4,167 cubic second feet.**

This brief is filed by leave of court on behalf of these *Amici Curiae* because of the facts above set forth, to show that the decree below should be reversed.

BRIEF OF POINTS AND AUTHORITIES.

I.

INTRODUCTORY: THE QUESTION OF SOVEREIGN POWER AS BETWEEN THE UNITED STATES AND THE STATE OF ILLINOIS.

Missouri v. *Illinois*, 200 U. S. 518;
Columbus v. *Merc. Trust Co.*, 218 U. S. 645;
Covington Bridge Co. v. *Kentucky*, 154 U. S. 204, 209;
Montgomery v. *Portland*, 190 U. S. 89, 105;
Lake Shore R. R. Co. v. *Ohio*, 173 U. S. 285, 292;
U. S. v. *Rio Grande Dam Co.*, 174 U. S. 690, 702, 703;
Guttierres v. *Albuquerque L. & I. Co.*, 188 U. S. 545, 553, 554;
Boquillas L. & I. Co. v. *Curtis*, 213 U. S. 339, 344, 345;
Willamette Iron Bridge Co. v. *Hatch*, 125 U. S. 1, 8;
Escanaba Trans. Co. v. *Chicago*, 107 U. S. 678, 683;
Cummings v. *Chicago*, 188 U. S. 410, 430.

II.

BEFORE CONGRESS HAD ACTED AT ALL ON THE SUBJECT OF OBSTRUCTING NAVIGABILITY, ILLINOIS WAS FREE TO AND DID EXERCISE ITS SOVEREIGN POWER OVER THESE NAVIGABLE WATERS WITHIN ITS OWN BOUNDARIES, BY BUILDING A CANAL TO "UNITE THE WATERS OF LAKE MICHIGAN WITH THOSE OF THE ILLINOIS RIVER," AND IN THE OPERATION OF THIS CANAL, FOR THE DUAL PURPOSE OF NAVIGATION AND SANITATION, ILLINOIS SINCE 1848 HAS CONTINUOUSLY AND LAWFULLY DIVERTED WATER FROM LAKE MICHIGAN.

Covington Bridge Co. v. *Kentucky*, 154 U. S. 204, 209;
U. S. v. *Rio Grande Dam Co.*, 174 U. S. 690, 703;

Illinois Session Laws 1836, page 145;
Corrigan Trans. Co. v. *Sanitary District*, 137 Fed. 851, 857.

III.

THIS EXERCISE OF SOVEREIGN POWER BY ILLINOIS, IN CONSTRUCTING AND OPERATING A CANAL THAT UNITED THE WATERS OF LAKE MICHIGAN WITH THOSE OF THE ILLINOIS RIVER, AND THAT DIVERTED WATER FROM LAKE MICHIGAN INTO THE MISSISSIPPI VALLEY, HAD THE SANCTION AND APPROVAL OF CONGRESS LONG BEFORE THE ORIGINAL CANAL WAS BUILT.

32 Annals of Congress, 15th Congress, 1st Session, 1677;
Act of March 30, 1822, 3 Stats. at L. 659;
Act of March 2, 1827, 4 Stats. at L. 234.

IV.

NEITHER THE BILLS, NOR THE DECREE, ARE BASED ON ANY CONTENTION OR SHOWING THAT ILLINOIS HAS UNNECESSARILY OR UNREASONABLY OR SUBSTANTIALLY INTERFERED WITH INTERSTATE COMMERCE. ON THE CONTRARY, THEY REST ENTIRELY ON THE THEORY THAT ILLINOIS CANNOT DIVERT ANY WATER FROM LAKE MICHIGAN FOR USE IN THE CANAL, WITHOUT THE FEDERAL CONSENTS PRESCRIBED IN SECTION 10, OF THE RIVERS AND HARBORS ACT OF 1899. IT IS THE THEORY OF THE BILLS THAT BOTH THE AFFIRMATIVE CONSENT OF CONGRESS AND THE PERMISSION OF THE SECRETARY OF WAR, AND THE RECOMMENDATION OF THE CHIEF OF ENGINEERS, MUST BE OBTAINED AS CONDITIONS PRECEDENT TO ANY DIVERSION WHATEVER. ON THIS THEORY NEITHER THE BILLS NOR THE DECREE CAN STAND, FOR THE REASONS TO BE STATED IN THE FOLLOWING POINTS.

U. S. v. *Rio Grande Dam Co.*, 174 U. S. 690, 703;
Escanaba Transit Co. v. *Chicago*, 107 U. S. 678, 683;
Cummings v. *Chicago*, 188 U. S. 410, 430.

V.

SECTION 10, OF THE RIVERS AND HARBORS ACT OF 1899, WAS NOT INTENDED TO BE RETROACTIVE IN EFFECT. IT DOES NOT APPLY TO THIS ALREADY EXISTING DIVERSION WHICH HAD BEEN VALIDLY AUTHORIZED BY ILLINOIS. IT LOOKS TO THE FUTURE NOT TO THE PAST.

U. S. v. *Bellingham Bay Boom Co.*, 176 U. S. 211, 214;

U. S. v. *Rio Grande Dam Co.*, 174 U. S. 690, 703.

VI.

CONGRESS DID NOT INTEND BY SECTION 10, OF THE RIVERS AND HARBORS ACT OF 1899, TO DECLARE THAT THIS PARTICULAR DIVERSION IS IN FACT, EITHER AN OBSTRUCTION TO NAVIGABILITY OR AN UNREASONABLE OR UNNECESSARY OR SUBSTANTIAL OBSTRUCTION. NOR DID CONGRESS INTEND, BY SUCH ACT, TO TAKE SUCH GENERAL OR EXCLUSIVE POSSESSION OF THE SUBJECT OF OBSTRUCTIONS TO NAVIGABILITY, AS TO RENDER UNLAWFUL ALL OBSTRUCTIONS NOT SPECIFICALLY AUTHORIZED BY FEDERAL CONSENTS, AS PRESCRIBED IN THE ACT.

Cummings v. *Chicago*, 188 U. S. 410, 430.

VII.

THE FACT THAT CONGRESS BY THE "NIAGARA FALLS ACT" OF 1906, EXPRESSLY GAVE TO THE SECRETARY OF WAR AUTHORITY TO CONSENT TO DIVERSIONS OF WATER FROM THE NIAGARA RIVER, SHOWS CLEARLY THAT CONGRESS HAD NOT THERETOFORE INTENDED TO COVER THE SAME FIELD BY SECTION 10, OF THE RIVERS AND HARBORS ACT OF 1899, WHEREBY IT WAS DECLARED UNLAWFUL "TO ALTER * * * THE * * * CAPACITY OF ANY * * * CANAL, LAKE * * * OR OF THE CHANNEL OF ANY NAVIGABLE WATER OF THE UNITED STATES, UNLESS THE WORK HAS BEEN RECOMMENDED BY THE CHIEF OF ENGINEERS AND AUTHORIZED BY THE SECRETARY OF WAR PRIOR TO BEGINNING THE SAME."

Act of June 29, 1906, 34 Stats. at L. 626;
59th Congress, 1st Session, Report #4694;
Congressional Record June 2, 1906.

VIII.

TO SUSTAIN THE DECREE, IT IS NECESSARY TO CONSTRUE SECTION 10, OF THE RIVERS AND HARBORS ACT OF 1899, AS A GRANT TO THE SECRETARY OF WAR OF UNLIMITED POWER TO PERMIT OR REFUSE THE CREATION OF OBSTRUCTIONS TO NAVIGATION. THE ACT DOES NOT ADMIT OF SUCH A CONSTRUCTION.

1. The power, conferred by the Act upon the Secretary of War, was intended to be administrative in effect and narrow in scope. It could not have been intended to authorize him to act, in place of Congress, in deciding broad questions of sovereign right or public policy, such as the judicial question whether Illinois had the sovereign power to divert water from Lake Michigan, or the legislative questions whether Illinois should be allowed to divert water, and what quantity, and for what purpose.

2. In attempting by his order of December 5, 1901, to fix and limit the quantity of water that appellant might divert from Lake Michigan, the Secretary of War necessarily assumed that he had power:

(a) To supersede and make inoperative the statute of Illinois theretofore enacted, pursuant to its reserved police power, by which Illinois had authorized appellant to use navigable waters within the state for the health and welfare of its people.

(b) To deny to the Illinois and Mississippi River Valleys the diversion of the quantity of water needed for effective waterway navigation, and to decide that the interests of the Great Lakes were of higher public value than those of the Mississippi Valley.

(c) To substantially reduce the low water flow of these two rivers, and thereby greatly increase the cost to the Government of maintaining a reasonable channel from the Lakes to the Gulf.

(d) To decide the question of public policy involved, in permitting a diversion of 4,167 c. f. s., thereby, to this extent, lowering lake levels and reducing water power at Niagara, and so deciding rights claimed by the citizens of Canada, while at the same time denying the right of appellant to a larger diversion.

IX.

(1) IF CONGRESS HAD INTENDED BY ITS ACTS TO DELEGATE TO THE SECRETARY OF WAR THE POWER TO DECIDE SUCH QUESTIONS, THIS ATTEMPTED DELEGATION WOULD HAVE BEEN UNCONSTITUTIONAL AND VOID, BECAUSE CONGRESS FAILED TO FURNISH ANY GUIDE, PRINCIPLE OR RULE, PURSUANT TO WHICH THE SECRETARY SHALL EXERCISE THE POWER IN QUESTION.

Wichita R. R. Co. v. *Public Utilities Commission,* 260 U. S. 48, 58.

(2) AND EVEN IF SUCH POWER HAD BEEN VALIDLY DELEGATED, THE MANNER OF ITS EXERCISE IN THE CASE AT BAR CANNOT BE SUSTAINED UNDER THE "DUE PROCESS" CLAUSE—BECAUSE MANY INTERESTS DIRECTLY AND ADVERSELY AFFECTED BY THE DECISION OF THE SECRETARY, INCLUDING THESE AMICI CURIAE, WERE GIVEN NO NOTICE OR OPPORTUNITY TO BE HEARD, AND THE ACT REQUIRED NO SUCH NOTICE OR HEARING.

Union Bridge Co. v. *U. S.* 204 U. S. 364, 385;
Monongahela Bridge Co. v. *U. S.* 216 U. S. 177, 192.

X.

ASSUMING FOR ARGUMENT ONLY, THAT SECTION 10, OF THE RIVERS AND HARBORS ACT OF 1899, AND THE AUTHORITY OF THE SECRETARY OF WAR THEREUNDER, DID APPLY TO APPELLANT'S DIVERSION, NEVERTHELESS THE REQUIREMENTS OF SAID ACT WERE MET, IN THAT ILLINOIS HAD OBTAINED THE PRIOR "AFFIRMATIVE AUTHORITY OF CONGRESS," AND THE PARTICULAR WORKS WERE "AUTHORIZED BY THE SECRETARY OF WAR" AND "RECOMMENDATION BY THE CHIEF OF ENGINEERS."

(1) The State of Illinois built its Sanitary and Ship Canal, pursuant not only to the sovereign power of the State, but also under the "affirmative authority" of Congress.

Mortell v. *Clark,* 272 Ill. 201, 213.

(2) The particular "works" which resulted in this diversion by appellant were also "authorized by the Secretary of War," and "recommended by the Chief of Engineers."

XI.

THE CONTENTIONS MADE IN THE BRIEF FILED ON BEHALF OF THE LAKE STATES, APPEARING AS AMICI CURIÆ, ARE EITHER OUTSIDE THE ISSUES OF THIS CASE, OR WITHOUT MERIT.

Illinois Central R. R. v. *Illinois*, 146 U. S. 387, 435;
U. S. v. *Rio Grande Dam Co.*, 174 U. S. 697;
Kansas v. *Colorado*, 206 U. S. 46;
Guttierres v. *Albuquerque L. & I. Co.*, 188 U. S. 545, 553, 554;
Boquillas L. & I. Co. v. *Curtis*, 213 U. S. 339, 344, 345;
Leovy v. *U. S.*, 177 U. S. 621, 636;
Missouri v. *Illinois*, 200 U. S. 496, 526.

XII.

WITHOUT REGARD TO QUESTIONS OF LEGAL POWER, THE RELATIVE EQUITIES IN THE INSTANT CASE REQUIRE A REVERSAL OF THE DECREE.

BRIEF OF THE ARGUMENT.

I.

INTRODUCTORY: THE QUESTION OF SOVEREIGN POWER AS BETWEEN THE UNITED STATES AND THE STATE OF ILLINOIS.

We understand, and shall assume in this brief, that the courtesy extended by the Court to these *amici curiae* permits them merely to make such suggestions as they think may aid the Court in its consideration of the issues presented by the record. Therefore, in presenting the contentions herein submitted on behalf of these *amici curiae*, and also in endeavoring to answer the contentions made in the briefs for the Lake States and for the Lake Carriers Association, we shall endeavor to confine this brief to the points that we think are thus in issue.

In the case at bar, two sovereigns, Illinois and the United States, have each attempted to exercise sovereign power concerning certain navigable waters of the United States located within the State of Illinois. Each sovereign claims that its own action was valid and effective, and that the other's action was, in certain respects, illegal and ineffective. So, before a conclusion can be reached, it is necessary, first, to have clearly in mind the exact subject matter involved, and the nature and extent of the power of each sovereign over this subject matter.

The subject matter consists of the navigable waterway between Lake Michigan and the mouth of the Illinois River, **all of which** (including a part of Lake Michigan) **lies within the State of Illinois**, and part of which (the southwest part of the Lake) is the **property** of Illinois.

By work done wholly within its own borders, *i. e.*, by deepening and widening the Chicago River, and by building and

operating a canal to be used for navigation and sanitation, Illinois has reversed the flow of the Chicago River, and with water thereby extracted by gravity flow from Lake Michigan, has greatly improved the navigability of this waterway, has purified Chicago's water supply, has abated the unsanitary condition of the Chicago and Illinois Rivers, and has disposed of Chicago sewage by diluting it and causing it to flow away from the Lake and down this waterway, instead of into the Lake. Illinois claims that all of these acts were within its sovereign powers.

But the Government claims that this diversion of water has to some extent lowered the level of the Lakes, has thereby caused "an obstruction" to their "navigable capacity," and is unlawful solely because Illinois did not obtain the several Federal consents required by Section 10, of the Rivers and Harbors Act of 1899.

The State of Illinois has all the powers of a sovereign except those expressly granted to the National Government by the Constitution of the United States. There exists no superior law which controls Illinois in the exercise of its reserved sovereign powers, unless it be found in the language of the Constitution, or in a law of the United States, properly founded upon the Constitution.

Missouri v. *Illinois*, 200 U. S. 518, at .....

Even though an exercise of State sovereignty may result in remediable injury to another state or its citizens, there exists no superior law which because of such injury renders unlawful such exercise of sovereignty. The Constitution provides a remedy for such situations, but in no sense contains any prohibition against such acts. The injured state may, by original suit before the Supreme Court redress such injuries, and in a proper case the Supreme Court may assert the power of the nation to prevent such acts, and of course declare them unlawful, but in advance of such a decision by the

Supreme Court, there exists no power to declare such acts unlawful, nor is there any law applicable thereto. Up to the present, no decision of this Court in a proper case, has declared the acts of Illinois here in question, to be unlawful.

To protect the health of its people by providing proper supplies of drinking water and adequate sanitary disposals of sewage is peculiarly within the sovereign powers of Illinois; (*Columbus* v. *Mercantile Trust Co.*, 218 U. S. 645, at 648).

In respect of local subjects that concern its public policy, a state **may** (as shown by cases cited herein), **exercise its sovereign powers** over **navigable waters within its borders.**

While the power to construct **a canal** within a state, as in the case at bar, is cited by this court as an instance in the class of cases in which the power of the state is exclusive of Congressional control under the Commerce Clause, (*Covington Bridge Co.* v. *Kentucky*, 154 U. S. 204, at 209), the power **to improve navigable channels within a state**, as in the case at bar, is within the class of cases described by this court in the same case (page 211) as of "**concurrent jurisdiction,**" *i. e.*, the failure of Congress to take complete legislative control of the subject **leaves the states free to act**; (*Montgomery* v. *Portland*, 190 U. S. 89, at 105); and when the state's sovereign powers are exercised in reference to matters more or less connected with interstate commerce, such powers are not restricted to mere regulations pertaining to the health, morals or physical well being of the public, but may also include actions designed to promote the public convenience or prosperity, like bridging navigable rivers within the state, etc.; (*Lake Shore R. R. Co.* v. *Ohio*, 173 U. S. 285, at 292).

When Congress, by failing to take complete legislative control of the subject, leaves the states free to act in respect of subjects of "concurrent jurisdiction," a state may act, even though it thereby causes incidental obstruction to navigability.

In the exercise of such power **a State may permit the appropriation and diversion of water from a navigable stream,** subject, however, as in the case of other concurrent powers, to a proper exercise of the jurisdiction of Congress to preserve navigability.

In *U. S.* v. *Rio Grande Dam Co.*, 174 U. S. 690, at 702-703, there was a diversion of water from the Rio Grande River (flowing between the United States and Mexico), and a claim by the United States, that such diversion of water from the Rio Grande River should be abated as a substantial obstruction to navigability.

Concerning the power of a state to change the common law rule against the appropriation of the waters of a river, this court said, at page 702-3, (heavy face type ours):

> "* * *, it is also true that as to every stream within its dominion **a state may change this common law rule** and **permit the appropriation of the flowing waters for such purposes as it deems wise** * * *.
>
> Although this power of changing the common law rule as to streams within its dominion undoubtedly belongs to each state, yet two limitations must be recognized: * * * That **it (the state) is limited by the superior power of** the general government **to secure the uninterrupted navigability** of all navigable streams within the limits of the United States. In other words, the jurisdiction of the general government over interstate commerce and its natural highways vests in that government the right to take all needed measures **to preserve the navigability** of the navigable water courses of the country even against any state action. **It is true there have been frequent decisions recognizing the power of the state, in the absence of congressional legislation, to assume control of even navigable waters within its limits to the extent of creating dams,** booms, bridges **and other matters which operate as obstructions to navigability. The power of the state to thus legislate for the interests of its own citizens is conceded,** and **until** in some way **Congress asserts its superior power,** and the necessity of preserving the general interest of the people of all the states, **it is assumed that state action, although in-**

volving temporarily an obstruction to the free navigability of a stream, is not subject to challenge. A long list of cases to this effect can be found in the reports of this court. See among others, the following: *Wilson* v. *Black Bird Creek Marsh Co.* 2 Pet. 245; *Gilman* v. *Philadelphia,* 3 Wall. 713; *Escanaba Co.* v. *Chicago,* 107 U. S. 678; *Willamette Iron Bridge Co.* v. *Hatch,* 125 U. S. 1."

All this proceeds upon the theory that non-action by Congress implies its assent to the action taken by the state.

For other cases in which there were diversions or appropriations of water and in which the power of the states was recognized, see: *Guttierres* v. *Albuquerque Land & Irr. Co.* 188 U. S. 545, at 553-554; *Boquillas Land and Irr. Co.* v. *Curtis,* 213 U. S. 339, at 344-345.

The power of the United States, is limited to the constitutional grant of power to **"regulate"** through the action of Congress, interstate and foreign commerce, which includes power to protect the navigability of the navigable waters of the United States: (*Willamette Iron Bridge Co.* v. *Hatch,* 125 U. S. 1, at 8; *U. S.* v. *Rio Grande Dam Co.* 174 U. S. 690, at 703.)

But this grant of power does not *per se* exclude all exercise by the states of their sovereign power over navigable waters within their own borders.

The power of Congress **must be exercised,** in order to become effective as a restraint upon state action. And its exercise does not necessarily or in all cases exclude or invalidate state action.

This Court has, in a number of cases, treated the powers of a state to improve navigable waters within its borders as pertaining to the "concurrent jurisdiction," *i. e.,* to the class of cases in which a failure by Congress to take complete legislative control of the subject leaves the states free to act upon such portion of said subject as Congress has not

completely occupied; *Montgomery* v. *Portland,* 190 U. S. 89, at 105; *Escanaba Transp. Co.* v. *Chicago,* 107 U. S. 678, at 683.

In the last named case this court held—in respect of bridges built by the City of Chicago across the Chicago River, (a part of the same navigable water involved in the case at bar), which bridges were complained of as obstructions to the navigability of the river,—that such local subjects are of the "concurrent jurisdiction" class, *i. e.,* **within the power** of the state (page 683), **"until Congress interferes and supersedes it."** And speaking of the state's exercise of such power, and the superior control of Congress over the same, the Court said, at page 683 (heavy type ours):

> "When its power is exercised **so as to unnecessarily obstruct** the navigation of the river or its branches, Congress may interfere and remove the obstruction. * * *
>
> But **until Congress acts** on the subject the **power of the state over bridges across its navigable streams is plenary."**

But in order thus to interfere, Congress must in fact exercise its constitutional power to regulate commerce, and it can do this **only by legislation** which **clearly evidences its intent to interfere with what the state has theretofore done** in the exercise of the latter's sovereign power.

As this Court said in *Cummings* v. *Chicago,* 188 U. S. 410, at 430, in construing Section 10, of the Rivers and Harbors Act of March 3, 1899, and in deciding that by said Section 10, Congress did not assume even such exclusive jurisdiction as to override the necessity of complying with the requirements of a mere ordinance of the City of Chicago, which called for the prior approval of a city officer:

> "If it had intended by the Act of 1899 * * * **to supersede entirely,** the authority which the states, in the absence of action by Congress, have in such matters, such a radical departure from the previous policy of the Government **would have been manifested by clear and**

explicit language. In the absence of such language, it should not be assumed that any such departure was intended."

Therefore, unless it be held that Section 10, of the Act of 1899, does contain a clearly expressed intent of Congress to interfere with and abate this diversion of water from Lake Michigan, which Illinois had theretofore validly authorized, and to which Congress itself had theretofore expressly given its approval by the Act of March 2, 1827, **the authority and action of the State must stand.**

II.

BEFORE CONGRESS HAD ACTED AT ALL ON THE SUBJECT OF OBSTRUCTING NAVIGABILITY, ILLINOIS WAS FREE TO AND DID EXERCISE ITS SOVEREIGN POWER OVER THESE NAVIGABLE WATERS WITHIN ITS OWN BORDERS, BY BUILDING A CANAL TO "UNITE THE WATERS OF LAKE MICHIGAN WITH THOSE OF THE ILLINOIS RIVER," AND IN THE OPERATION OF THIS CANAL, FOR THE DUAL PURPOSES OF NAVIGATION AND SANITATION, ILLINOIS SINCE 1848 HAS CONTINUOUSLY AND LAWFULLY DIVERTED WATER FROM LAKE MICHIGAN.

Each of these purposes, as shown by above cases, was within the sovereign powers of Illinois. Independently of any consent by Congress, it had the power to authorize the construction of a navigable canal, within its borders. (*Covington Bridge Co.* v. *Kentucky,* 154 U. S. 204 at 209.) And that this power was exercised for the purpose of preserving the health of its people,—a matter over which Congress had no jurisdiction—certainly did not weaken the legal effectiveness of the state's exercise of its sovereign power.

Moreover, as held in *U. S.* v. *Rio Grande Dam Co.,* 174 U. S. 690 at 703 (see above), the State also had concurrent power to change the common law rule in reference to flowing waters, and to authorize a diversion of water from Lake Michigan, for use in the canal, and (Congress not having

acted adversely) the State had this power even without the consent of Congress.

The State of Illinois, by its General Assembly, passed an Act, January 9, 1836, (Illinois Sessions Laws, 1836, p. 145; Appts. Narr. St. pp. 412, 413), under which the "Illinois and Michigan" canal was constructed.

By this Act the width of the canal was fixed and additional space for its future enlargement was provided. The depth was to be suitable for ordinary "canal navigation."

That a diversion of water from Lake Michigan through said canal was contemplated, is shown by the provision in Section 16, of said statute, that the canal was **"to be supplied with water from Lake Michigan** and such other sources as the canal commissioners may think proper."

Work on this canal was started by Illinois on July 4, 1836, and the canal was put in operation in 1848. Because adequate funds were lacking to construct a "deep cut" canal through the Divide, the original canal was constructed on the "shallow cut plan" with a summit level eight feet above Lake Michigan (Appts. Narr. St. 416.) But water was supplied by pumps from the Chicago River at Bridgeport (where the canal and river met) and thus from Lake Michigan. To the extent that the canal was fed from the Calumet and Chicago rivers, both of which emptied into Lake Michigan, **there was a diversion.**

Such diversion continued until 1871, when the "Deep Cut Plan" had been adopted and carried out (Appts. Narr. St. p. 419) for the dual purposes of providing greater depth in the canal, and of relieving unsanitary conditions in the Chicago River. Water from Lake Michigan was thereafter supplied to the canal by gravity flow, (Appts. Narr. St. 420-421). And because later this flow was reduced by a natural lowering of the level of Lake Michigan the flow was, in 1883, materially

increased by pumping. (Appts. Narr., Cooley's testimony, p. 272.) This increased diversion continued until Appellant's "Sanitary and Ship Canal" was constructed and opened in place of the Illinois and Michigan canal, for the dual purposes of navigation and sanitation, pursuant to Act of the General Assembly of Illinois, May 29, 1889, (Session Laws of Illinois 1889, p. 126), which created Appellant, authorized the construction and operation of the present canal, and directed a diversion of water from Lake Michigan. (Appts. Narr. St. p. 449.)

All this had been done by Illinois before Congress passed the Act of March 3, 1899, on which these bills rely.

As was said by the Circuit Court of Appeals, 7th C. in *Corrigan Transit Company* v. *The Sanitary District of Chicago*, 137 Fed. 851, at 857:

> "With the commerce clause in abeyance, Illinois, as to every being in the world except future congresses was absolute sovereign in the premises."

III.

THIS EXERCISE OF SOVEREIGN POWER BY ILLINOIS, IN CONSTRUCTING AND OPERATING A CANAL THAT UNITED THE WATERS OF LAKE MICHIGAN WITH THOSE OF THE ILLINOIS RIVER, AND THAT DIVERTED WATER FROM LAKE MICHIGAN INTO THE MISSISSIPPI VALLEY, HAD THE SANCTION AND APPROVAL OF CONGRESS LONG BEFORE THE ORIGINAL CANAL WAS BUILT.

This claim of Illinois, that it had the power, as a sovereign state, to build and operate a canal that would divert waters from Lake Michigan into the Mississippi Valley, has been recognized by Congress ever since Illinois became a state, in 1818.

When Congress, in 1818, fixed the boundaries of Illinois, prior to admitting the state, Congress, by an amendment to

the original act, included within the new state what is now the northern part of Illinois, including the southwestern part of Lake Michigan. The purpose of this inclusion, as then stated in Congress, was to gain a coast on Lake Michigan and thereby to connect Illinois through the lakes with the states of Indiana, Ohio, Pennsylvania, and New York; and it was also stated (32 Annals of Congress, 15th Congress, First Session, p. 1677); that:

> "The facility of opening a canal **between Lake Michigan and the Illinois River is acknowledged** by everyone who has visited the place. **Giving to the proposed state** the Port of Chicago (embraced in the proposed limits), will **draw its attention to the opening of the communication between the Illinois River and that place, and the improvement of that harbor.**" (App. Narr., page 405.)

By thus "**drawing the attention**" of Illinois "**to the opening of the communication between the Illinois River and the Port of Chicago,**" it is clear that Congress expected and practically invited the new state to exercise its sovereign power by opening such a "communication," leaving, of course, to the state, liberty of action under its sovereign power to determine the size and character of the canal, thus suggested as desirable to be opened between the two water sheds.

The well known fact that the water level of the Port of Chicago, opening into Lake Michigan, was much higher than the Gulf of Mexico, necessarily involved and assumed a diversion of water from the Lake into the Illinois River and the Mississippi Valley, when such a "communication" should be "opened." This expectation of Congress, that Illinois would construct and operate a canal to connect Lake Michigan and the Illinois River, was given more definite expression by the Act of Congress of March 30, 1822, (3 U. S. St. at L., page 659; App. Narr. Statement, 410). From this Act we quote:

> "**An Act to Authorize the State of Illinois to Open a**

Canal Through the Public Lands to Connect the Illinois River with Lake Michigan.

SECTION 1. Be it enacted * * * that the State of Illinois be, and is hereby authorized to survey and mark, through the public lands of the United States, the route of the canal connecting the Illinois River with the southern bend of Lake Michigan; * * * and the use thereof forever shall be, and the same is hereby vested in the said state, for a canal, and for no other purpose whatever; * * * provided, also, and it is hereby further enacted and declared, that the said canal when completed shall be and forever remain a public highway, etc. * * *"

Concerning the above language it should be noted:

(a) The title indicates that in 1822, Congress was still expecting Illinois "to open a canal to connect the Illinois River with Lake Michigan," as the "communication" between the Illinois River and the Port of Chicago that Illinois had been invited to open when it was admitted as a state.

The title also clearly recognizes that Illinois had sovereign power to open such a canal, because the authority expressed in the title has relation only to opening a canal through the public lands, for which the consent of Congress was necessary, but is not predicated on the theory that Congress could authorize the opening of a canal through any other lands.

(b) Section 1, of the Act, emphasizes the idea that the authority intended to be granted, had relation to a permit to cross the public lands rather than a permit to build a canal. This appears from the words:

> "Illinois * * * is hereby authorized to survey and mark through the public lands of the United States the route of the canal connecting the Illinois River with the Southern bend of Lake Michigan."

By the words "the canal," Congress evidently had in mind some previously discussed plan for a canal, rather than by this Act to originate a new project.

This Act also contained a provision, that if Illinois did not

make a survey and furnish a complete copy thereof to the Treasury Department within three years, then the grant of land made by the Act, would become void; and the failure of Illinois to comply with this condition, did in fact void the Act.

The project for such a canal, however, did not die. In 1826, the legislature of Illinois petitioned Congress for an additional Act to aid Illinois in the construction of the canal.

In this memorial of Illinois, (App. Narr., page 411), it is stated:

> "That **the construction of a canal, uniting the waters of Lake Michigan with the Illinois River,** will form an important addition to the great connecting links in the chain of internal navigation, etc."

In 1827, Congress granted this petition of Illinois, by the Act of March 2, 1827, (4 U. S. Stat. at L. page 234), entitled and providing:

An Act To Grant a quantity of land to the State of Illinois, for the purpose of aiding in opening a canal to connect the waters of the Illinois River with those of Lake Michigan.

> "Section 1. Be it enacted * * * that there be and hereby is granted to the State of Illinois, for the purpose of aiding the said State in opening a canal to unite the waters of the Illinois River with those of Lake Michigan, a quantity of land equal to one-half of five sections in width on each side of said canal * * *; provided, THAT the said canal when completed shall be and forever remain a public highway for the use of the Government of the United States free from any toll or other charge whatever for any property of the United States or persons in their service passing through the same; * * *
>
> (2) And be it further enacted, That, so soon as the route of said canal shall be located and agreed on by the said State, it shall be the duty of the Governor thereof, or such other person or persons as may have been, or shall hereafter be, authorized to superintend the construction of said canal, to examine and ascertain the particular sections to which said State will be entitled

under the provisions of this Act, and report the same to the Secretary of the Treasury of the United States."

(a) Here again, the attitude and action of Congress show, that in 1827, it was still expecting Illinois to open the water communication between the Illinois River and the Port of Chicago, to which, as above stated, reference had been made in Congress as one of the purposes of including a part of Lake Michigan within said state.

The language of the Act, constitutes an express recognition by Congress, that Illinois had sovereign power to build a canal to connect the waters of the Illinois River with those of Lake Michigan, because the grant made by Congress was not of permission **to construct** such a canal but was of land, and was expressly made, for the purpose "of aiding" Illinois, in the exercise by the latter of its sovereign power to open such a canal.

(c) A canal that would, as stated in Section 1, of the Act, unite the waters of the Illinois River with those of Lake Michigan, necessarily meant a diversion from the St. Lawrence water shed to the Mississippi Valley, of whatever quantity of water Illinois might in its sole discretion decide to thus divert; and this quantity was necessarily subject to such additions from time to time as Illinois might deem necessary, for the purpose of meeting the changing conditions of its advancing civilization.

(d) While this grant was of land, and was not expressed to be a grant of Congressional permission or authority to build a canal, (thus evidencing the Congressional concept that Illinois, under its sovereign power, could build such a canal without the prior authority of Congress), it is nevertheless, **by necessary implication,** a clear expression by Congress of its consent and approval to the construction by Illinois of a canal that would unite the waters of the Illinois River with those of Lake Michigan.

We therefore respectfully submit, that it is clear from the attitude and actions of Congress, above set out: That Congress understood and assumed, that the exercise of sovereign power by Illinois, in constructing and operating such a canal **did not require the prior consent of Congress**; and that the historic project for the union of said navigable waters had not only the sanction and approval of Congress before the original canal was built, but it also had the affirmative aid of Congress to the extent that Congress deemed its aid necessary to authorize the resulting diversion of Lake waters, by a grant of lands which could be sold by Illinois and the proceeds used in the construction of the canal.

IV.

NEITHER THE BILLS, NOR THE DECREE, ARE BASED ON ANY CONTENTION OR SHOWING THAT ILLINOIS HAS UNNECESSARILY OR UNREASONABLY OR SUBSTANTIALLY INTERFERED WITH INTERSTATE COMMERCE. ON THE CONTRARY, THEY REST ENTIRELY ON THE THEORY THAT ILLINOIS CANNOT DIVERT ANY WATER FROM LAKE MICHIGAN FOR USE IN THE CANAL, WITHOUT THE FEDERAL CONSENTS PRESCRIBED IN SECTION 10, OF THE RIVERS AND HARBORS ACT OF 1899. IT IS THE THEORY OF THE BILLS THAT BOTH THE AFFIRMATIVE CONSENT OF CONGRESS AND THE PERMISSION OF THE SECRETARY OF WAR, AND THE RECOMMENDATION OF THE CHIEF OF ENGINEERS, MUST BE OBTAINED AS CONDITIONS PRECEDENT TO ANY DIVERSION WHATEVER. ON THIS THEORY NEITHER THE BILLS NOR DECREE CAN STAND, FOR THE REASONS TO BE STATED IN THE FOLLOWING POINTS.

The State of Illinois having validly authorized the diversion of water from Lake Michigan pursuant to the State's plenary though "concurrent jurisdiction," it follows that thereafter Congress could take action to prevent such diversion only **if the diversion constituted an unreasonable or substantial interference with interstate commerce, by materially obstructing navigability.**

We respectfully submit that this conclusion necessarily follows from the fact that the sovereign power, when thus exercised by Illinois, was validly exercised, and therefore the State's permission to divert water from the Lake was a valid permission, even though such action "caused incidental obstruction to navigability," (*U. S.* v. *Rio Grande Dam Co.*, 174 U. S. 690 at 703).

As this Court said in *Escanaba Transp. Co.* v. *Chicago*, 107 U. S. 678 at 683, referring to the State's exercise of its said power by building bridges across the navigable Chicago River:

> "When its power is exercised **so as to unnecessarily obstruct** the navigation of the river or its branches, **Congress may interfere and remove the obstruction.**"

But Congress **must act** in order to thus "interfere" with the State's action. And it cannot be possible that Congress may interfere with and abate what the State has validly done, unless the State has in fact caused an unreasonable or substantial obstruction to navigability.

If a state has in fact caused an unreasonable or substantial obstruction to navigalibity, which Congress thereafter seeks under its dominant power, to abate, Congress may do so only by a statute appropriate to effectuate such purpose. Such a statute must, in clear and explicit language, express the intent of Congress to interfere with what the State has already done. This, it may do either by expressly referring to the particular obstruction intended to be abated, or by defining some general class of obstructions intended to be abated, within which class the particularly obstruction will fall. And no pre-existing obstruction will be presumed to come under condemnation by Congress, unless the intent of Congress to abate it has been clearly and explicitly expressed in one or the other of the above methods.

No Act of Congress directed toward the abatement of ob-

structions to be created in the future, will be construed to also condemn existing obstructions that had theretofore been validly authorized by a State, unless this retroactive intent is also expressed in clear and explicit language.

Under this established doctrine, we respectfully submit that the decree below is erroneous and should be reversed with dismissal of the bills, because:

(a) The fact does not seem open to dispute, that Illinois had exercised its sovereign power, and had validly authorized a diversion of water from Lake Michigan, and such diversion had commenced—all with the express sanction of Congress—long before Congress enacted any general law purporting to deal with obstructions to navigability.

(b) An examination of Sec. 10 of the Act of 1899, discloses that:

First: This Section is prospective in effect. It was not intended to apply to existing structures. A comparison with Sec. 18 of this Act, which is clearly intended to apply to such existing structures as come within its terms, demonstrates the correctness of this conclusion as to Section 10.

Second: No distinction is drawn in Sec. 10, between obstructions to navigability authorized and created by due exercise of State sovereignty, and structures otherwise originated.

Third: The Section does not evidence or declare such an exclusive taking over of its subject matter by Congress as to supersede all State authority. This Court has so construed it in *Cummings* v. *Chicago,* 188 U. S. at p. 430.

Fourth: The conclusion is inevitable, in view of the above quoted declarations of this Court concerning the method in which Congress must act in order to effectively assert its superior power over obstructions to navigability theretofore validly authorized by a State, that no intent to interfere with or abate this diversion can be found in Section 10, because

such intent must be "manifested by clear and explicit language," and Section 10 contains no language that clearly or explicitly shows such intent.

Fifth: The language of this Section clearly shows it was not an attempt by Congress to enunciate the rule of the Escanaba Case, *supra*, that is, to *generally* forbid unnecessary, unreasonable or material obstructions to navigation authorized by the States. And the Government in this case has not so interpreted the statute, because,

(c) There is no allegation in the bills, that the State of Illinois has unreasonably, unnecessarily, or substantially obstructed navigation by this diversion. There is not a single allegation designed to define or describe the extent or character of the claimed obstruction to navigation.

On the contrary, the case made by the bills, is that all of Appellant's acts are unlawful to the extent that they were not previously authorized by the several Federal consents required (according to the theory of the bills) in every case of any obstruction to navigation, however, authorized, or however slight.

V.

SECTION 10, OF THE RIVERS AND HARBORS ACT OF 1899, WAS NOT INTENDED TO BE RETROACTIVE IN EFFECT. IT DOES NOT APPLY TO THIS ALREADY EXISTING DIVERSION WHICH HAD BEEN VALIDLY AUTHORIZED BY ILLINOIS. IT LOOKS TO THE FUTURE NOT TO THE PAST.

(1) The language of Section 10 itself is prospective, not retrospective. Thus,

> "Section 10. **That the creation of any obstruction** not affirmatively authorized by Congress to the navigable capacity of any of the waters of the United States **is hereby prohibited;** * * * and **it shall not be lawful** * * * in any manner **to alter or modify** * * * **the capacity** of any * * * canal, lake, etc.; or of the channel of any

navigable water of the United States unless the work **has been recommended** by the Chief of Engineers and **authorized** by the Secretary of War **prior to beginning** the same."

This contention finds added support in the fact that Section 18, of this same Act, does expressly evidence the intent to apply the provisions of Section 18, to already existing bridges, as well as to those thereafter to be constructed. Thus, the opening portion of the Section reads:

> "SEC. 18. That whenever the Secretary of War shall have good reason to believe that any railroad or other bridge **now constructed**, or which **may hereafter be constructed** over any of the navigable waterways of the United States is an unreasonable obstruction to the free navigation of such waters, etc. * * *, it shall be the duty, etc."

In other words, it is evident by a comparison of this above quoted language of Section 18, with the above quoted language of Section 10, that Congress had in mind distinguishing between obstructions to navigability that already existed and those still to be created, in expressing its intent concerning each of said classes of obstructions; and that as to bridges, both those already in existence and those still to be constructed, Congress expressed its intent to make Section 18 retroactive, by the use of "clear and explicit language" to evidence said intent. On the other hand, in Section 10, having no intent to make said Section retroactive, Congress omitted all such language, and on the contrary employed language that distinctly looks to the future, not to the past,—that is distinctly prospective, not retrospective in effect.

(2) In *U. S.* v. *Bellingham Bay Boom Co.*, 176 U. S. 211, this Court construed Section 10 of the Rivers and Harbors Act of 1890 as not retroactive.

The first sentence of Section 10 of said Act of 1890 reads:

> "That the creation of any obstruction, not affirmatively authorized by law, to the navigable capacity of any wa-

ters in respect of which the United States has jurisdiction, is hereby prohibited. * * *"

Concerning this Section the Court said (176 U. S. 211 at 214):

> "It is evident that the first sentence of the 10th Section of the Federal Act refers to an obstruction created **after the passage of the Act.**"

And in *U. S.* v. *Rio Grande Dam Co.*, 174 U. S. 690, speaking of the same Section 10 of the Act of 1890, the Court said, page 708:

> "Whatever may be said in reference to obstructions existing at the time of the passage of the Act, under the authority of state statutes, it is obvious that Congress meant **thereafter,** no state should interfere with the navigability of a stream without the condition of national assent."

It may safely be said, that if either of said Acts of 1890, or 1899, contained expressions looking to the past, it was the Act of 1890, rather than the Act of 1899. Therefore, the fact that Section 10, of the Act of 1890, was held not to be retroactive argues the more strongly for a similar conclusion in respect to Section 10, of the Act of 1899.

VI.

CONGRESS DID NOT INTEND BY SECTION 10, OF THE RIVERS AND HARBORS ACT OF 1899, TO DECLARE THAT THIS PARTICULAR DIVERSION IS IN FACT, EITHER AN OBSTRUCTION TO NAVIGABILITY OR AN UNREASONABLE OR UNNECESSARY OR SUBSTANTIAL OBSTRUCTION. NOR DID CONGRESS INTEND, BY SAID ACT, TO TAKE SUCH GENERAL OR EXCLUSIVE POSSESSION OF THE SUBJECT OF OBSTRUCTIONS TO NAVIGABILITY, AS TO RENDER UNLAWFUL ALL OBSTRUCTIONS NOT SPECIFICALLY AUTHORIZED BY FEDERAL CONSENTS, AS PRESCRIBED IN THE ACT.

It is only necessary to read Section 10, of the Act of 1899, to show that Congress did not by this Act refer specifically

to this diversion of water at Chicago, or declare it to be either an obstruction to navigability, or an unreasonable or unnecessary or substantial obstruction to navigability. If Congress had intended to interfere with or to abate this already existing Chicago diversion, the cases above cited show that it would have been necessary for Congress to do so by language clearly expressing such intent.

And assuming that it was open to Congress to express such intent, either by specific reference to this particular diversion, or by taking such general or exclusive possession of the subject of obstructions to navigability as would render unlawful, not only this particular obstruction, but all other existing obstructions that had not received the express authorization by Federal authorities as prescribed in the Act,—it is also plain that by Section 10, Congress did not intend to take such general or exclusive possession of this subject as to render this diversion unlawful.

This was clearly the basis of the reasoning of the Court in the decision of *Cummings* v. *Chicago* (188 U. S. 410) as above quoted.

When it is remembered, that by the Act of 1827, as shown above, Congress had expressly recognized the validity of this exercise of the sovereign power of Illinois, and had approved the project for such a canal, it should be still more necessary, to find unmistakable evidence in the words of this general statute expressing such intent, in order to bring within its condemnation this previously approved canal.

We therefor respectfully submit, that the conclusion is inevitable upon the authorities above quoted, that the bills and decree cannot stand because Section 10, of the Act of 1899, on which alone this entire case rests, did not make unlawful this diversion of water at Chicago which had theretofore been validly authorized by the State of Illinois.

VII.

THE FACT THAT CONGRESS BY THE "NIAGARA FALLS ACT" OF 1906, EXPRESSLY GAVE TO THE SECRETARY OF WAR AUTHORITY TO CONSENT TO DIVERSIONS OF WATER FROM THE NIAGARA RIVER, SHOWS CLEARLY THAT CONGRESS HAD NOT THERETOFORE INTENDED TO COVER THE SAME FIELD BY SECTION 10, OF THE RIVERS AND HARBORS ACT OF 1899, WHEREBY IT WAS DECLARED UNLAWFUL "TO ALTER * * THE * * * CAPACITY OF ANY * * * CANAL, LAKE * * * OR OF THE CHANNEL OF ANY NAVIGABLE WATER OF THE UNITED STATES, UNLESS THE WORK HAS BEEN RECOMMENDED BY THE CHIEF OF ENGINEERS AND AUTHORIZED BY THE SECRETARY OF WAR PRIOR TO BEGINNING THE SAME."

On June 29, 1906 Congress passed the Act for the preservation of Niagara Falls, and for the control and regulation of waters of the Niagara River. (34 Stat. at L. 626.) In the report (59th Cong. 1st Sess. Report No. 4654, Cong. Rec. June 2, 1906) submitted by the Rivers and Harbors Committee of the House accompanying this bill, the Committee states:

> "The Committee regarded the jurisdiction of the United States over Niagara River as unquestionable, because it is a navigable stream in the greater part of its length, and although the waters in some portions are not navigable by reason of falls and rapids, the control of such portions is essential to its adequate maintenance for purposes of navigation. * * * At the beginning of the development of water power at Niagara Falls, no account seems to have been taken of the possible danger to the cataract. The diversion of water was commended as an industrial endeavor of material benefit to the country. While there are, no doubt, many who regret that this diversion was ever commenced, it is impossible to ignore entirely the development which has occurred without injustice to those who have undertaken it. At the same time, it is the opinion of this Committee that these rights should be construed with strictness; that no permit should be issued by the Federal Government for the diversion of water, either for that now in use or which may hereafter be used, except with the right of revocation."

The report also states (heavy face type ours):

"It appears that numerous franchises have been granted by the State of New York for the diversion of water and the creation of power. Of this, however, only two of any considerable importance have been acted upon. * * * The total diversion of water for these two companies which is authorized by the State of New York amounts to 17,200 and 9,500 cubic feet respectively; in all 26,700 cubic feet to be taken from the American side. The total amount at present utilized is about 12,600 cubic feet." * * *

It is a matter of some surprise that the companies which have proceeded to divert the waters of the river under the authority of the State of New York, have never appealed to Congress or to the Federal Government to confirm the authority granted by that state. It is thought best by the Committee that the Federal Authority should now be exerted not merely for the preservation of the scenic grandeur of Niagara Falls, but for the maintenance of navigation and the proper control of the river as a boundary stream."

The first Section of this Act reads as follows:

"That the diversion of water from Niagara River or its tributaries, in the State of New York, is hereby prohibited, except with the consent of the Secretary of War as hereinafter authorized in Section 2 of this Act; but, Provided, That this prohibition shall not be interpreted as forbidding the diversion of the waters of the Great Lakes or of Niagara River for sanitary or domestic purposes, or for navigation, the amount of which may be fixed from time to time by the Congress of the United States or by the Secretary of War of the United States under its direction."

As stated above, the bills in this case rest exclusively on the theory that Section 10, of the Act of 1899, forbids any obstruction to navigation not authorized by the Federal consents specified in the Section and that by this diversion at Chicago an obstruction to navigation as defined in Section 10, has occurred. If this were a proper interpretation of the meaning of Section 10, clearly the diversions from the Niag-

ara River, a navigable stream, had already been forbidden by Section 10, of the Act of 1899.

It must be assumed that in passing the Niagara Falls Act, particularly in view of the prohibitions contained in its first section, Congress did not intend to do an idle or unnecessary thing, nor to do over again anything that it considered had been accomplished by its previous legislation,—therefore, we respectfully submit, that by passing the Niagara Falls Act, Congress itself has thereby construed Section 10, of the Act of 1899, **as not forbidding diversions.**

As stated in the report above, until the passage of the Niagara Falls Act, the sole authority for diversions in the Niagara River were the statutes of the State of New York. No Federal supervision of this matter had occurred.

It may be well to point out, concerning the Niagara Falls Act, that the proviso relating to diversions of the waters of the Great Lakes or of the Niagara River, for sanitary or domestic purposes, is prospective in its nature, and does not apply to diversions existing at the time of the enactment. The reasons for this interpretation of the proviso are clearly stated in the brief filed on behalf of the appellant, point IV (c) of argument, page 179-181.

VIII.

TO SUSTAIN THE DECREE, IT IS NECESSARY TO CONSTRUE SECTION 10, OF THE RIVERS AND HARBORS ACT OF 1899, AS A GRANT TO THE SECRETARY OF WAR OF UNLIMITED POWER TO PERMIT OR REFUSE THE CREATION OF OBSTRUCTIONS TO NAVIGABILITY. THE ACT DOES NOT ADMIT OF SUCH A CONSTRUCTION.

(1) The power conferred by the Act upon the Secretary of War was intended to be administrative in nature and narrow in scope. It could not have been intended to authorize him to act, in place of Congress, in deciding broad questions

of sovereign right or of public policy, such as the judicial question whether Illinois had the sovereign power to divert water from Lake Michigan, or the legislative questions whether Illinois should be allowed to divert water, and what quantity, and for what purposes.

An examination of Section 10, shows at once that Congress in the enactment of this statute did not, as it has done in other matters, for instance the regulation of railroad interstate rates, lay down a broad general principle, and delegate to the Secretary of War authority to determine in particular instances whether facts justified or required the application of the principle.

Section 10, entirely fails to define under what circumstances the Secretary of War shall grant a permit. Congress, of course, cannot be presumed to have delegated to the Secretary of War its own legislative power. To avoid any such interpretation, which would invalidate the section, the power of the Secretary must be strictly construed, and to be of an administrative nature. The propriety of construing his authority as narrow in scope is strengthened by the fact, that under Section 10, the Secretary of War has power to grant the permit specified in the Act, only when the work has been first recommended by the Chief of Engineers.

As disclosed by the record in this case, Secretary of War Taft so construed the statute, when he refused a permit requested by appellant, on the ground that the work in that particular instance, had not been recommended by the Chief of Engineers (Rec., Vol. VIII, 113, 114).

Aside from the first sentence of Section 10, it is submitted that the language there used applies only to construction or engineering works. The Section declares it to be unlawful "to **build**" or "commence the **building**" of certain specified structures. It then declares it to be unlawful "to **excavate**, or **fill**, or in any manner to alter or modify the course, loca-

tion, condition or capacity of" navigable waters, "unless the **work** has been recommended by the **Chief** of **Engineers** and authorized by the Secretary of War prior to **beginning** the same." The words emphasized above refer, we submit, to matters of engineering work, as distinguished from the results of such work or its uses or effects when completed. They serve merely to point out the manner in which proposed *methods* of engineering work, such as excavation, filling, etc., may receive the approval of the Government.

Of course, when Congress passed the Act, it knew that for many years it had been appropriating money and directing its use for harbor, river, and channel improvement, and had been carrying out such improvements through the War Department under the supervision of the Chief of Engineers. Is it not a reasonable interpretation of the Congressional intent to conclude that requiring permits for "works" was insisted upon in order that constructions in the navigable waters of the United States undertaken by persons other than the War Department should be harmonious and not inconsistent, with the plans of harbor development and improvement which the Department was or would at any time be carrying out, pursuant to Congressional requirement? This seems to us a reasonable interpretation of this Section, and if this be its interpretation, clearly the authority of the Secretary and of the Chief of Engineers is, as stated above, administrative in nature and not broad, arbitrary or unlimited.

(2) **In attempting by his order of December 5, 1901, to fix and limit the quantity of water that appellant might divert from Lake Michigan, the Secretary of War necessarily assumed that he had power:**

> **(a) To supersede and make inoperative the Statute of Illinois theretofore enacted pursuant to its reserved police power, by which Illinois had authorized appellant to use navigable waters within the State for the health and welfare of its people.**

We shall now endeavor to show,—by examining the nature and effect of the order of the Secretary of War of December 5, 1901, by which in substance, he decided that Illinois may divert 4,167 cubic feet of water per second, but may not divert any water in excess of said amount fixed by him,—that Section 10 of the Act of 1899 should not be construed as is claimed in these bills, because such construction presupposes the existence of authority in the Secretary of War far different in nature and greater in scope than could have been contemplated by Congress, or even validly delegated to him by Congress.

The authorities heretofore discussed show that the power of Congress to interfere with and abate a previously State-authorized obstruction to navigability, is a legislative power. Therefore, since its exercise must be predicated upon the judgment of Congress itself, either concerning a particular obstruction, that it is substantial and should be interfered with and abated—or concerning a general class of definitely described obstructions within which a particular obstruction might fall—it is obvious that if the Secretary of War were to decide such questions and within his undirected discretion to issue or refuse a permit, he would thereby exercise a legislative power that Congress is incapable of delegating.

We have endeavored to show earlier herein, that the language of Section 10, of the Act of 1899, is not open to the construction that it does either outlaw this particular diversion or lay down any general retroactive rule under which this obstruction would become outlawed. It is obvious that by deciding in his order of December 5, 1901, that appellant should not be permitted to divert from Lake Michigan more than a limited quantity of water fixed by him, the Secretary of War attempted to exercise the power of Congress to interfere with a prior Act of Illinois, valid when enacted and only to be superseded by the exercise of Congressional power to take exclusive possession of the field.

It is manifestly the theory of the bills, that if the Secretary of War had permitted a diversion of 10,000 cubic feet per second, these suits would not have been brought, because under said theory the diversion of 10,000 cubic feet per second would have been lawful. In other words, the Government's charge of illegality rests entirely on the theory that because the Secretary of War has not permitted this diversion it is unlawful, and, therefore, the Government claims that power was delegated to the Secretary of War to grant or permit diversions to any extent whatsoever, if recommended by the Chief of Engineers.

Certainly Congress could not have intended so completely to delegate its own legislative power.

(b) **To deny to the Illinois and Mississippi River Valleys the diversion of the quantity of water needed for effective waterway navigation, and to decide that the interests of the Great Lakes were of higher public value than those of the Mississippi Valley.**

The decision of the Secretary of War not only involved the important question of delegated authority discussed above in subdivision (a), but also required him to decide the broad question of public policy whether, as between the Illinois and Mississippi Valleys on the one hand, and the Great Lakes on the other, any diversion should be permitted and the extent and quantity thereof.

Certainly Congress did not intend to delegate to an executive or administrative officer any such comprehensive power. The broad nature of the power actually exercised by the Secretary of War is shown by the facts in this record. The Government claims a lowering of lake levels of about 5½ inches. Our statement of facts shows that the water diverted by Appellant when turned into the Mississippi River at Grafton serves to increase depths in the Mississippi between Grafton and the mouth of the Ohio about a foot and one-half. The

Court will note that all that Congress is attempting to maintain in this part of the Mississippi River is a navigable depth of six feet. Can it be claimed that Congress intended to delegate to the Secretary of War the power to decide as between the navigation interests of the Mississippi Valley and those of the Great Lakes which should be preferred? This seems to us inconceivable.

(c) **To substantially reduce the low water flow of these two rivers, and thereby greatly increase the cost to the Government of maintaining a reasonable channel from the Lakes to the Gulf.**

The necessary effect of the decision by the Secretary of War that Appellant, instead of diverting 10,000 cubic feet per second, should be compelled to reduce its diversion to less than one-half of said amount, is to substantially diminish the flow of the Illinois and Mississippi Rivers. And this in turn necessarily increases the cost to the Government of the work of dredging and otherwise keeping open and protecting a reasonably usable channel on the Illinois and Mississippi Rivers. It is peculiarly within the province of Congress alone to determine how much money shall be spent for this particular purpose and where it shall be spent. Certainly Congress did not intend by Section 10, of the Act of 1899, to delegate to the Secretary of War any such broad power; and yet this is in effect the Government's claim.

(d) **To decide the question of public policy involved in permitting a diversion of 4,167 cubic second feet, thereby, to this extent, lowering lake levels and reducing water powers at Niagara, and so deciding alleged rights claimed by citizens of Canada, while at the same time denying the right of appellant to a larger diversion.**

The record shows that the contest or conflict between water power interests at Niagara on the one hand, and the interests of Chicago and the Mississippi Valley which need this 10,000

cubic feet of water on the other hand, constitutes an aggressively active dispute. This dispute involves to some extent the claims made by Canadian interests of the right to divert water at Niagara. Also the extent to which Canadian interests may be damaged by this Chicago diversion. If, as the record indicates, a diversion of 10,000 cubic feet per second has caused a lowering of lake levels to the extent of 5½ inches, each other diversion, as well as any contemplated decrease or increase of this diversion, would also have its effect upon lake levels. Therefore, it is clear that if Section 10, of the Act of 1899, be construed to authorize the Secretary of War at his discretion, upon recommendation of the Chief of Engineers, to determine the quantity of diversions that may be made at Chicago, or elsewhere, such decisions would not only involve international relations and claims, but would also delegate to him power to decide questions of broad public policy that Congress alone may validly decide.

IX.

(1) IF CONGRESS HAD INTENDED BY THESE ACTS TO DELEGATE TO THE SECRETARY OF WAR THE POWER TO DECIDE SUCH QUESTIONS, SUCH AN ATTEMPTED DELEGATION WOULD HAVE BEEN UNCONSTITUTIONAL AND VOID, BECAUSE CONGRESS FAILED TO FURNISH ANY GUIDE, PRINCIPLE OR RULE, PURSUANT TO WHICH THE SECRETARY SHALL EXERCISE THE POWER IN QUESTION.

In *Wichita Railroad* v. *Public Utility Commission*, 260 U. S. 48, at page 58, this Court, in dealing with the constitutionality, under a state statute, of an order entered by an administrative body, held the order invalid because not entered in compliance with the general rules laid down in the statute. The Court said, at page 58:

> "This conclusion accords with the construction put upon similar statutes in other states. * * * Moreover, it accords with general principles of constitutional government. The maxim that a legislature may not dele-

gate legislative power has some qualifications, as in the creation of municipalities, and also in the creation of administrative boards to apply to the varying details of rate schedules the regulatory police power of the state. The later qualification is made necessary in order that the legislative power may be effectively exercised. In creating such an administrative agency the legislature, to prevent this being a pure delegation of legislative power, must enjoin upon it a certain course of procedure and certain rules of decision in the performance of its function. * * * It is a wholesome and necessary principle that such an agency must pursue the procedure and rules enjoined and show a substantial compliance therewith, to give validity to its action."

We submit that it is not possible to find any expression in Section 10, of the Act of 1899, which prescribed any procedure the Secretary of War must follow, in granting or refusing the permits therein specified, nor any rules by which he shall be guided in determining whether a particular obstruction shall or shall not be permitted. So far as the language is concerned, the power of the Secretary to grant or refuse a permit is not restricted, confined or guided by any expression whatever to be found in the Section.

The only way in which the power of the Secretary to grant or refuse a permit under this Section can be constitutionally sustained, is to read into the Section by construction the intention of Congress that this power is a narrow one, to be exercised as above suggested merely for the purpose of keeping engineering and other structures in the navigable waters of the United States harmonious and consistent with the work of harbor and channel improvement conducted by the Secretary of War.

It must be assumed that Congress knew of the above "constitutional maxim" concerning the delegation of power by Congress, and that therefore, not having by Section 10 prescribed any course of procedure or rules of decision to control the Secretary of War in granting or issuing permits, it

is clear that Congress did not intend to delegate to the Secretary of War the broad powers claimed by these bills.

(2) AND EVEN IF SUCH POWER HAD BEEN VALIDLY DELEGATED, THE MANNER OF ITS EXERCISE IN THE CASE AT BAR CANNOT BE SUSTAINED UNDER THE "DUE PROCESS" CLAUSE—BECAUSE MANY INTERESTS DIRECTLY AND ADVERSELY AFFECTED BY THE DECISION OF THE SECRETARY, INCLUDING THESE AMICI CURIAE, WERE GIVEN NO NOTICE OR OPPORTUNITY TO BE HEARD, AND THE ACT REQUIRED NO SUCH NOTICE OR HEARING.

That the interests of these *amici curiae* are adversely affected by the Secretary of War's action is, we assume, not open to question.

In the case of *Union Bridge Co.* v. *United States,* 204 U. S. 364, this Court was called upon to construe another Section (18) of the Act of 1899. The following provisions of this Section should be carefully noted:

> "SEC. 18: Whenever the Secretary of War shall have good reason to believe that any railroad or other bridge now constructed or which may hereafter be constructed, over any of the navigable waterways of the United States, is an unreasonable obstruction to the free navigation of such waters, on account of insufficient height, width of span, or otherwise, or where there is difficulty in passing the draw opening or the draw span of such bridge by rafts, steamboats or other water craft, it shall be the duty of the said Secretary, first giving the parties reasonable opportunity to be heard, to give notice to the persons or corporations owning or controlling such bridge, so to alter same as to render navigation through or under it reasonably free, easy and unobstructed; and in giving such notice, he shall specify the changes recommended by the Chief of Engineers that are required to be made, and shall prescribe in each case a reasonable time in which to make them. * * *"

The rights of those whose interests are to be affected by the action of the Secretary of War are here fully protected. Notice must be given. A hearing must be allowed. The

changes required must be specified. A reasonable time within which to make the changes must be permitted. Furthermore, the power of the Secretary can only be exercised when there is an "**unreasonable**" interference with navigation.

Contrast these provisions with the provisions of Section 10.

The opinion in the *Union Bridge Case, supra,* discloses the requirements which Section 10 must meet before it can be held constitutional. The Court said (204 U. S., p. 385):

> "It would seem too clear to admit of serious doubt that the statute under which the Secretary of War proceeded is in entire harmony with the principles announced in former cases. In no substantial, just sense does it confer upon that officer, as a head of an executive department, powers strictly legislative or judicial in their nature, or which must be exclusively exercised by Congress or by the Courts. It has long been the policy of the Government to remove such unreasonable obstructions to the free navigation of the waterways of the United States as were caused by bridges maintained over them. That such an object was of common interest and within the competency of Congress, under its power to regulate commerce, everyone must admit; for commerce comprehends navigation; and therefore to free navigation from unreasonable obstructions is a legitimate exercise of that power. *Gibbons* v. *Ogden,* 9 Wheaton, 1, 189, 190. As appropriate to the object to be accomplished, as a means to an end within the power of the national government, Congress, in execution of a declared policy, committed to the Secretary of War the duty of ascertaining all the facts essential in any inquiry where the particular bridges over the waters of the United States, were unreasonable obstructions to free navigation. Beyond question, if it had so elected, Congress, in some effective mode and without previous investigation through executive officers, could have determined for itself primarily, the fact whether the bridge here in question was an unreasonable obstruction to navigation, and if it was found to be of that character, could by direct legislation have required the defendant to make such alterations of its bridge as were requisite for the protection of navigation and commerce over the waterway in question. * * *

By the statute in question, Congress declared in effect that navigation should be free from unreasonable obstructions arising from bridges of insufficient height and width of span or other defects. It stopped, however, with this declaration of a general rule and imposed upon the Secretary of War the duty of ascertaining what particular cases came within the rule prescribed by Congress, as well as the duty of enforcing the rule in such cases. In performing that duty, the Secretary of War will only execute the clearly expressed will of Congress, and will not, in any true sense exert legislative or judicial power. * * * To this may be added the consideration that Congress, by the Act of 1899, did not invest the Secretary of War with any power in these matters that could reasonably be characterized as arbitrary. He cannot act with reference to any bridge alleged to be an unreasonable obstruction to free navigation without first giving the parties an opportunity to be heard. He cannot require any bridge of that character to be altered even for the purpose of rendering navigation through or under it reasonably free, easy and unobstructed, without giving previous notice to the persons or corporations owning or controlling the bridge specifying the changes recommended by the Chief of Engineers, and allowing a reasonable time in which to make them. * * * In the present case, all the provisions of the statute were complied with. The parties concerned were duly notified and were fully heard. Nor is there any reason to say that the Secretary of War was not entirely justified, if not compelled, by the evidence in finding that the bridge in question was an unreasonable obstruction to commerce and navigation as now conducted.

We are of the opinion that the Act in question is not unconstitutional as conferring upon the Secretary of War powers of such nature that they should not be delegated to him by Congress."

The reasoning thus employed by the Court in construing Section 18, of the Act of 1899, is, in and of itself, sufficient to demonstrate the unconstitutionality of any such delegation of powers as the bills in this case claim.

The *Union Bridge Case, supra,* was followed by the deci-

sion in *Monongahela Bridge* v. *United States*, 216 U. S. 177. Again a question arose under Section 18, of the Act of 1899. The Court was urged to reconsider its ruling in the Union Bridge case, and in the opinion stated the law as follows (p. 192):

> "This Court has heretofore held, upon consideration and after an examination of the adjudged cases:
>
> (1) That 18th Section of the river and harbor Act of March 3, 1899, 30 Statutes 1151, could not reasonably be taken as a delegation of legislative and judicial power to an executive department of the government; that the statute did not in any real, constitutional sense delegate to the Secretary of War any power that must, under our system of government, be exclusively exercised either by the legislative or judicial branch of the government; that under its paramount power to regulate commerce on and over the navigable waters of the United States, Congress could require that such waters be free from unreasonable obstructions to navigation; that the statute in effect prescribed the general rule, applicable to all navigable waters, that free navigation should not be hampered by unreasonable obstructions arising from bridges of insufficient height, width of span, or other defects; that instead of exerting its power by direct legislation in each case of a bridge alleged to constitute an unreasonable obstruction to navigation, Congress charged the Secretary of War with the duty of ascertaining, in each case, upon notice to the parties concerned, whether the particular bridge came within the general rule prescribed;
>
> * * *
>
> (2) That the Act of 1899 did not invest the Secretary of War with arbitrary power in the premises, since in reference to any bridge alleged to constitute an unreasonable obstruction to navigation, he was bound, before making any decision or taking final action, to notify the parties interested of any proposed investigation by him, give them an opportunity to be heard, and allow a reasonable time to make such alterations as he found to be necessary to free navigation."

The Court also said, page 195:

> "It is for Congress, under the Constitution, to regulate the right of navigation by all appropriate means, to

declare what is necessary to be done in order to free navigation from obstruction, and to prescribe the way in which the question of obstruction shall be determined. Its action in the premises cannot be revised or ignored by the Courts or by juries, except that when it provides for an investigation of the facts, upon notice and after a hearing before final action is taken, the Courts can see to it that executive officers conform their action to the mode prescribed by Congress."

We represent here substantial interests that are adversely and materially affected by the decision of the Secretary of War limiting the amount of appellant's diversion. In reaching this decision, there was in fact no hearing of any kind, nor any notice to these *amici curiae*, and they had no opportunity to be heard. So far as they are concerned, there was an entire absence of all those requirements of due process, which alone, under the two above decisions, could render constitutional Section 10.

X.

ASSUMING FOR ARGUMENT ONLY, THAT SECTION 10, OF THE RIVERS AND HARBORS ACT OF 1899, AND THE AUTHORITY OF THE SECRETARY OF WAR THEREUNDER, DO APPLY TO APPELLANT'S DIVERSION, NEVERTHELESS THE REQUIREMENTS OF SAID ACT WERE MET, IN THAT ILLINOIS HAD OBTAINED THE PRIOR "AFFIRMATIVE AUTHORITY OF CONGRESS," AND THE PARTICULAR WORKS WERE "AUTHORIZED BY THE SECRETARY OF WAR" AND "RECOMMENDED BY THE CHIEF OF ENGINEERS."

(1) The State of Illinois built its Sanitary and Ship Canal, pursuant not only to the sovereign power of the state, but also under the "affirmative authority" of Congress.

As we have endeavored to show above (Point III of this brief), the Act of March 2, 1827 (4 U. S. Stat. at L, p. 234), evidenced the expressed purpose of Congress to "aid" Illinois "in opening a canal to unite the waters of the Illinois River with those of Lake Michigan."

While the grant was of *land*, the fact that it was for the expressed purpose of *aiding* Illinois in the opening of such a canal, necessarily implied and carried with it, the affirmative sanction of Congress, to the opening of such a canal; and the grant of this sanction effectively disposes of any contention that under the Commerce Clause, the right to build such a canal was exclusively vested in Congress.

As we have also endeavored to show, under Point III of this brief, it was clearly the view of Congress concerning its powers and those of Illinois respectively, that Illinois had the sovereign power to build such a canal without the consent of Congress, and the land grant made by Congress in aid of this exercise of state sovereignty, constituted not only a recognition by Congress that Illinois had such power, but it also "affirmatively" expressed the sanction and approval of Congress to the carrying out of this project for a canal.

The purpose of Congress in making this grant was undoubtedly in aid of navigation and commerce; and the jurisdiction of Congress attached solely under the Commerce clause. But the sovereign power of Illinois to build and use the Canal for sanitation as well as commerce cannot be denied.

Because of the well known physical facts, that the waters of the Illinois River flow (via the Mississippi) into the Gulf of Mexico, and that the level of the water of Lake Michigan is much higher than that of the Gulf, this grant necessarily included and contemplated the consent of Congress to the diversion of water from Lake Michigan through said canal and into the Mississippi River.

This consent of Congress was given without condition or limitation upon the size of the canal or the quantity of water that might thus be diverted. That the navigable waterway thus contemplated was intended to forever exist, be maintained and operated, as a public waterway, was expressly stated in the Act.

Therefore it does not seem open to question, that so far as the United States is concerned, Illinois had and has the "affirmative authority" of Congress, and the right and power, to forever maintain and operate a navigable ship canal "uniting the waters of the Illinois River with those of Lake Michigan"; that this canal may be of capacity and size reasonably adequate to care for the needs of navigation and commerce as they may develop; and that the quantity of water that may be diverted from Lake Michigan for this purpose, may be increased from time to time to meet the reasonable needs of Illinois for its public purposes;—all without the need of further or additional consent of the United States.

The record shows that pursuant to this Act, and also under its own sovereign power as hereinabove stated, Illinois in 1836 passed a statute under which the "Illinois and Michigan Canal" was constructed and operated.

We have already shown that when this Illinois and Michigan Canal was improved by a deep cut across the Divide in 1871, water flowed by gravity from Lake Michigan through the Chicago River into the canal, and has continued to do so ever since, thus uniting the waters of the Illinois River with those of Lake Michigan.

We have also shown that Appellant's present Sanitary and Ship canal took the place of this earlier canal.

The Supreme Court of Illinois, in *Mortell* v. *Clark*, 272 Ill. 201 at 213,—referring to Appellant's present canal, said:

> "**The canal was built under the authority of the Act of Congress of March 2, 1827,** the Act of 1822 having been mutually abandoned by the state and Federal Government. * * * This Federal Act did not provide just where the canal should enter Lake Michigan, simply stating that the land was granted for the purpose of opening 'a canal to unite the waters of the Illinois River with those of Lake Michigan,' etc. **The Sanitary District's main channel as now constructed complies with this Act and furnishes a canal more suitable for navigation than**

the Illinois and Michigan Canal. Furthermore, the Sag channel or cut off is required to be navigable by the said Act of 1903, and the proof shows that the Calumet River is navigable to the point where it is intersected by the sag channel. This cut off would, therefore, also **practically comply** with both of said Federal Acts as to furnishing part of the canal for connection of the Illinois River with Lake Michigan."

This decision by the Supreme Court of Illinois, is conclusive upon the fact that Appellant's present canal was constructed pursuant to a grant expressed in the Act of March 2, 1827; that it was intended to take the place under said Act, of the Illinois and Michigan canal; and that it is in fact and law a substitute under said Act for the Illinois and Michigan canal, as the canal "to unite the waters of the Illinois River with those of Lake Michigan."

We shall not attempt in this brief, to state or discuss the numerous facts appearing of record and discussed in the brief of Appellant, showing the attitude of the United States toward the Illinois and Michigan canal, during its construction and long service or toward the construction, opening and use of Appellant's present Sanitary and Ship canal, up to the time when the Secretary of War attempted in 1901 to limit the amount of diversion from Lake Michigan.

We deem it sufficient for the purpose of this brief, to respectfully submit on this feature of the case, that said Act of Congress of 1827, constitutes the legally effective "affirmative authority" of Congress, for any reasonable method that Illinois might adopt, for the purpose of uniting the waters of the Illinois River with those of Lake Michigan,—and for periodically increasing the capacity of its canal, and the consequent diversion of water in order to keep the canal reasonably adequate to meet the growing needs of the communities served by it. As to the propriety of the method used by Illinois in carrying out this power,—and the improved health of its people due to these acts is fully described in this

record,—it is sufficient to say that this case on the record, presents only a question as to what power exists but no question as to the reasonableness of its exercise.

Neither of these bills seeks to attack Appellant's diversion on the ground that Illinois has abused or made unreasonable use of, the affirmative authority of Congress thus granted to Illinois by the Act of 1827.

(2) **The particular "works" which resulted in this diversion by appellant were also "authorized by the Secretary of War," and "recommended by the Chief of Engineers."**

The permit of May 8, 1899, in its granting power, states:

> "The Chief of Engineers having consented thereto, this is to certify that the Secretary of War hereby gives permission to the said Sanitary District of Chicago to open the channel constructed and cause the water of Chicago River to flow into the same, subject to the following conditions:"
> (the substance of which was):
> (1) That it is the intention of the Secretary of War to submit the questions connected with this work to Congress, for consideration, the permit to be subject to such action as may be taken by Congress.
> (2) The Secretary of War reserved the right to close or modify it in order to prevent a current unreasonably obstructive to navigation, in the Chicago River.
> (3) The Sanitary District to assume all responsibility for damages to property and navigation interests by reason of the introduction of a current in the Chicago River.

The opening of Appellant's canal, the reversal of the current of the Chicago River, and the consequent diversion of water from Lake Michigan were therefore authorized by the Secretary of War. So far as this case is concerned, there are no conditions upon this permit, because: Many secretaries of war have submitted the matter of this diversion to Congress, but no action has been taken by it; and there is no contention now that a current exists in the Chicago River unreasonably obstructive to navigation.

The Government, as well as Appellant, and the City of Chicago, spent large amounts of money in widening and deepening the channel of the Chicago River, and as the result of such work, 10,000 cubic feet of water per second may be diverted from Lake Michigan through the River and canal, without introducing an unreasonable current into the Chicago River.

We shall not present in detail, the several permits issued by the Secretary of War from time to time to the City of Chicago, or to the Sanitary District, permitting the various steps in the work above referred to, which resulted in the widening and deepening of the Chicago River. These are fully described in Appellant's brief.

We respectfully submit, however, that a consideration of these permits, particularly of the fundamental permit of May 8, 1899, above quoted, conclusively shows that each item of engineering work and construction, directly or indirectly causing a diversion from Lake Michigan of 10,000 cubic feet per second, has been specifically recommended by the Chief of Engineers and permitted by the Secretary of War.

Only after all of these permits had been issued, did the Secretary of War in 1901, by what purports to be a permit, attempt to regulate or limit the amount of water which flowed by gravity from Lake Michigan, as a necessary result of the engineering works theretofore authorized. When the work contemplated in 1901, had been completed, there was no longer any reason for a regulation of the amount of the diversion as affecting the current in the Chicago River. Moreover, the permit of 1901, was not in legal effect, a permit, but was an attempt to regulate the conduct of Appellant's works, and to qualify the unqualified permit that had previously been granted. No such power was given by Sec. 10.

XI.

THE CONTENTIONS MADE IN THE BRIEFS ON BEHALF OF THE LAKE STATES APPEARING AS AMICI CURIAE, ARE EITHER OUTSIDE THE ISSUES OF THIS CASE OR WITHOUT MERIT.

The contentions presented in points I, II, and III, of the brief for the Lake States, (page 12 to 29 of Argument), are a unit, and should be considered together.

Their substance is:

(a) That the Lake States are **absolute owners** of **all the waters** of the Lakes that were within their respective boundary lines when **admitted to statehood**, with the right **to have the said fixed quantity of water, plus all natural additions thereto, maintained as against any and all unnatural diversion or abstraction** (Lake States brief page 18);

(b) But since the "lower riparian owner on a stream may claim, as against the upper riparian owner, the right to a continued uninterrupted flow of the stream passing his lands," it follows, that a "lower state" on these lakes has a similar right "as against the upper states";

(c) While a riparian owner on a navigable stream can claim the right **to the use** of the water," the states' claim in this instance is to the full proprietary ownership of these waters";—therefore, the state's right thus being greater than that of a riparian owner—**the quantity** of the water under state ownership * * * was fixed and the State entitled to assert its sovereignty and ownership over such quantity and all natural additions thereto," (Brief page 17 to 18), consequently these Lake States can in this action, assert their said alleged rights as against this diversion at Chicago; and

(d) That Illinois, although a joint owner, was without right to authorize a diversion of the waters of the Great Lakes into another watershed, and thereby to provide for

"the extraordinary uses" of these waters by an agency of the state.

Concerning the above contentions we respectfully submit that:

(1) They are wholly irrelevant to the issues in the case at bar.

This is not a suit in equity to abate an alleged nuisance. It is not an original suit by the Lake States against Illinois to determine whether Illinois, as part owner of Lake Michigan, is making an unfair, inequitable, or unreasonable use of Lake waters. It is not even a suit by the Government to abate this diversion at Chicago, on the ground that it constitutes a substantial injury to navigability. This case is confined to the single issue, whether under Section 10, of the Act of 1899, Appellant's diversion of 10,000 cubic feet of water, is unlawful.

Upon this issue, the fact that these Lake States claim to own certain fixed proportions of the waters of the Great Lakes, is obviously of no consequence whatever.

(2) These contentions of the Lake States are based on a palpable misunderstanding of the established doctrines of this court, concerning the sovereign power of a state over navigable waters within its borders.

So far as concerns the issues in the case at bar, there is nothing peculiar to the Great Lakes or their waters, that distinguishes them from tide waters within a state, or waters of navigable rivers within a state or along its borders. There is no issue here concerning the title to lands bordering on or extending under any part of these Lakes, or concerning land between low water and high water marks, or concerning title upon such lands. All kinds of waters, tide, lake, and river—within a state, if in fact navigable for interstate commerce, would constitute part "of the navigable waters of the United

States" to which the Commerce Clause of the Constitution applies.

Concerning the sovereign rights and power of a state over navigable waters, including those of the Great Lakes, this court said, in *Ill. Cent. R. Co.* v. *Illinois*, 146 U. S. 387, at 435, (Heavy type ours):

> "It is settled law of this country that the ownership of, and dominion and sovereignty over, lands covered by tide waters, within the limits of the several states, **belong to the respective states within which they are found with the consequent right to use and dispose of any portion thereof, when that can be done without substantial impairment of the interest of the public in the waters, and subject always to the permanent right of Congress to control their navigation as far as may be necessary for the regulation of commerce with foreign nations and among the states.** * * *
>
> The same doctrine, in this court held to be applicable by lands covered by fresh waters in the Great Lakes, over which is conducted and extended commerce with different states and foreign nations."

But a state's ownership of such lands and its sovereignty over such waters, is not that of a private ownership; it is rather that of a sovereign trustee for the benefit of its public and for such reasonable uses as accord with the public welfare.

See *Ill. Cent. R. Co.* v. *Illinois*, 146 U. S. 387, at 457-8, where the court said:

> "Many other cases might be cited where it has been decided that the bed or soil of navigable waters is held by the people of the state in their character as sovereign in trust for public uses to which they are adapted, (citing cases)."

And at page 459 the court said:

> "The soil under navigable waters is held by the people of the state in trust for the common use and as a portion of their inheritant sovereignty. Any act of legislation concerning their use has to consider the public welfare. It is, therefore, appropriately within the exercise of the police power of the state."

We respectfully submit that a fundamental error of the above contentions for the Lake States, lies in their assumption that a state cannot change the common law rule regarding the right of a lower riparian owner to have the flow of a river continued.

The decisions of this Court have firmly established the doctrine, that a state may, out of its sovereign control and power over navigable waters within its borders, change this rule of the common law, and permit such reasonable uses, diversions and consumptions of its public waters, "for such purposes as it deems wise." (*U. S.* v. *Rio Grande Dam Co.*, 174 U. S. 690, at 702.)

In *Kansas* v. *Colorado,* (a diversion case), 206 U. S. 46, the court said, (heavy type ours) at page 93:

> "It is enough for the purpose of this case that each state has full jurisdiction over the lands within its borders, including the bottoms of streams and other navigable waters (Citing many cases).

And at page 94:

> **"It may determine for itself whether the common-law rule in respect to riparian rights or that doctrine which obtains in the arid regions of the West of the appropriation of waters for the purposes of irrigation shall control. Congress cannot enforce either rule upon any state** * * * At page 95—"But when the states of Kansas and Colorado were admitted into the Union they were admitted with the full powers of local sovereignty which belonged to other states (citing cases), and Colorado, by its legislation, has recognized the right of appropriating the flowing waters to the purposes of irrigation. Now the question arises between two states, one recognizing generally the common-law rule of riparian rights and the other prescribing the doctrine of the public ownership of flowing water. Neither state can legislate for, or impose its own policy upon the other. A stream flows through the two and a controversy is presented as to the flow of that stream. It does not follow, however, that because Congress cannot determine the rule which shall control between the two states, or be-

cause neither state can enforce its own policy upon the other, that the controversy ceases to be one of a justifiable nature, or that there is no power which can take cognizance of the controversy and determine the relative rights of the two states."

Thereupon the Court held that there was jurisdiction under the constitution to determine as between the two states, whether Colorado was unreasonably using its own property so as to inflict damage upon the neighboring state.

And in this case the court's decree did not disturb the existing diversions.

For additional cases in which this court has recognized the power of a state to change said common-law rule, see *Guittieres* v. *Albuquerque Land and Irr. Co.* 188 U. S. 545, at 533-554; *Boquillas* v. *Curtis,* 213 U. S. 339, at 344-345.

In *Leovy* v. *United States,* 177 U. S. 621, at 636, this Court held, that the act of a state in draining swamps for the purpose of protecting the health of its public, was a proper exercise of sovereign power even though such draining had the effect of partially impairing the navigability of neighboring waters.

In the case at bar, the state of Illinois, by appropriate legislation, has exercised its sovereign power over these waters within its borders, and has expressly authorized this division, thereby changing the common-law rule upon which are based the above contentions of the Lake States.

We therefore respectfully submit that under the above decisions of this court, said contentions are wholly without merit, and also have no place in a consideration of the issues here involved.

We do not contend that there are no limitations upon this sovereign power of Illinois. Its power is, of course, subject to the superior commerce power of Congress, if, and when Congress has properly acted. And an abuse of this power

by Illinois, may subject it to accountability for, or restraint upon, its action, in an appropriate original proceeding in this Court for said purpose. But the case at bar involves no such issues, and the fact that they are sought to be injected into this case by the Lake States cannot broaden the issues presented by this record.

(3) A further complete answer to the above contentions of the Lake States exists in the decision of this Court in *Missouri* v. *Illinois*, 200 U. S. 496, at 526, where the Court said:

> "Some stress was laid on the proposition that **Chicago is not on the natural watershed of the Mississippi**, because of a rise of a few feet between the Desplaines and the Chicago rivers. **We perceive no reason for distinction on this ground.** The natural features relied upon are of the smallest. And if, under any circumstances, they could affect the case, **it is enough to say that Illinois brought Chicago into the Mississippi watershed in pursuance, not only of its own statutes, but also of the acts of Congress of March 30, 1922** (*chap.* 14, 3 *Stat. at L.* 659), **and March 2, 1827** (*chap.* 51, 4 *Stat. at L.* 234), **the validity of which is not disputed.** *Wisconsin* v. *Duluth*, 96 *U. S.* 379, 24 *L. ed.* 668.)

(4) It is perhaps well, that the brief for the Lake States so frankly discloses their real and only substantial reason for objecting to this diversion at Chicago.

The unsubstantial nature of the claim of injury to the navigation interests of the Great Lakes has already been pointed out in the "statement" of this brief and is discussed at length in the brief for Appellant. But on pages 24 and 29 of the brief for the Lake States, many statements (most of which are not supported by any evidence in this record), are made concerning the interests of New York, Pennsylvania, Ohio, and Michigan, in the development of hydro-electric power at Niagara. It is at least a reasonable inference that the desire for greater profits from the sale of power, constitutes a much more urgent inducement for their opposition to this diver-

sion, than any fear that injury to navigation may result from such a slight (and easily compensated) lowering of Lake levels as this case presents.

We have already referred to the report appearing in the Congressional Record of the Rivers and Harbors Committee concerning the Niagara Falls Act of June 29, 1906, from which it appears that the Niagara River is a navigable stream in the greater part of its length, and that the State of New York, without at all seeking in any way the authority or approval of Congress, repeatedly authorized diversions from this River prior to 1906 **amounting in all to 26,700 cubic feet per second.** The Committee in its Report says:

> "It is a matter of some surprise that the companies which have proceeded to divert the waters of the River under the authority of the state of New York, have never appealed to Congress or to the Federal Government to confirm the authority granted by that State. It is thought best by the Committee that the Federal authority should now be exerted, not merely for the preservation of the scenic grandeur of Niagara Falls but for the maintenance of navigation and the proper control of the River as a boundary stream." (59 Congress, First Session, Report No. 4654, Congressional Record, June 2, 1906.)

In respect of this diversion at Niagara, much greater in amount than any diversion through the canal of Appellant, it would seem that the State of New York had no doubt as to its own sovereign power in the matter. Certainly New York is in no position to contend that Illinois could not exercise the same kind of sovereign power that New York itself thus exercised.

The facts, stated in the brief for the Lake States, concerning the present development of power at Niagara on the American side, show that the so-called "improved development" is under a main head of 215 feet. If the development were carried out to its full extent, the head would be in excess of 300 feet.

It therefore appears, that at the present time, approximately one-third of the available horse power at Niagara from the present authorized diversions, is wasted. Until this power is fully developed and this waste stopped, New York and its neighboring states, can hardly claim any very substantial injury from the diversion at Chicago. If the water now flowing into Appellant's canal were all to take its original course through the Niagara River, New York and its neighboring states, would not be obtaining any more power, because of New York's failure to properly develop their own authorized diversion.

The other contentions for the Lake States, and those made in the brief for the Lake Carriers Association, are already answered in this brief.

XII.

WITHOUT REGARD TO QUESTIONS OF LEGAL POWER, THE RELATIVE EQUITIES IN THE INSTANT CASE REQUIRE A REVERSAL OF THE DECREE.

Without regard to questions of power, the following considerations present equities which this Court should weigh:

a. If the decree be immediately enforced the health of all the inhabitants of Chicago and its surrounding communities—more than three million residents—will be endangered.

b. The importance of this consideration alone far outweighs all reasonable claim that there has been any discernible injury to navigation on the Lakes.

c. Any actual injury is more than offset by appellant's offer to do equity, by paying for the construction of compensating and regulating works which will restore and maintain lake levels.

d. In view of the practicability of restoring and maintain-

ing lake levels at relatively trifling cost, no decree should be permitted to defeat or hamper, or render prohibitive in cost, the established policy of the government to open and maintain a deep waterway from the Lakes to the Gulf.

e. In view of the feasibility of restoring and maintaining lake levels at relatively trifling cost without reducing the diversion at Chicago, no decree should subject the communities along the Illinois River and the Mississippi River, including the inhabitants of St. Louis, to the grave perils bound to follow an inadequate dilution of Chicago sewage.

f. In weighing the equities in respect of navigation alone, can there be any doubt that the importance of preserving and improving the navigability of the Lakes to the Gulf waterway for the benefit of these *amici curiae* and those they represent, far outweighs any equity for relief against a mere engineer's theory that injury to navigation on the Lakes has resulted from this diversion, although no Lake Captain has ever been found, able to perceive it?

(g) In weighing all the equities of this case, if the Court shall undertake to do so, can there be any doubt that the importance of protecting the health of the people of Chicago, St. Louis and other endangered communities, plus the importance of improving the navigability of the Lakes to the Gulf waterway in accord with the established public policy of Congress, far outweigh the importance of increasing the hydroelectric power at Niagara, the existence of which has stimulated these Lakes States into active opposition to Appellant's diversion?

We shall not attempt to elaborate the foregoing suggestions, believing that enough has already been said in the appellant's brief and this brief to bring to the court's attention the pertinent facts.

For the reasons herein stated, and upon the equities of the

case, we respectfully submit that the decree below should be reversed.

Respectfully submitted,

EDWARD J. BRUNDAGE,
Attorney General of Illinois.

IN THE

Supreme Court of the United States.

OCTOBER TERM, A. D. 1924.

THE SANITARY DISTRICT OF CHICAGO,
Appellant,

vs.

THE UNITED STATES OF AMERICA,
Appellee.

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES,
FOR THE NORTHERN DISTRICT OF ILLINOIS,
EASTERN DIVISION.

BRIEF AND ARGUMENT FILED BY THE STATES OF INDIANA, MICHIGAN, MINNESOTA, NEW YORK, OHIO, PENNSYLVANIA AND WISCONSIN BY PERMISSION OF THIS COURT AS *AMICI CURIAE.*

STATEMENT OF THE CASE.

MAY IT PLEASE THE COURT:

The States of Indiana, Michigan, Minnesota, New York, Ohio, Pennsylvania and Wisconsin, joining in this brief, have together with the State of Illinois extensive shore lines on the Great Lakes and all have a large volume of commerce on the Great Lakes, the waters of which

are being abstracted by the appellant. The State of Michigan alone has 1,624 miles of shore line. The Great Lakes with their connecting channels, constitute the most important system of inland navigation in the world. The traffic which passed through Detroit River, its busiest link, in 1910, amounted to 73,526,602 tons valued at about $771,000,000. About 80 per cent of this traffic is carried in large freight carriers, which are loaded down to the greatest draft that can be carried into the harbors or through the channels between the lakes; but could be loaded much deeper if the depth of water permitted. Some of the larger of the vessels carry an additional load of 85 tons for each inch of additional draft. Every inch added to the navigable depth of water would therefore be of material benefit to commerce.

The Great Lakes constitute a series of enormous natural reservoirs, each of which serves to regulate the flow in the river constituting its outlet and to maintain the lake below. They are interdependent. The study of one, to be complete, must include the study of all. The total area drained by the Great Lakes is about 287,688 square miles. Of this total about one-third is occupied by the lakes themselves; that is, devoted to reservoir purposes. The result is a uniformity of level and a uniformity of flow which are truly wonderful—a perfection of regulation which no work of man ever did or ever will approach. (Rec., Vol. 4, p. 3435.)

The division of the waters between the Great Lakes Basin and the Mississippi River Basin is known as the Continental Divide, an elevation of land in the State of Illinois within a few miles of Chicago. The Calumet and Chicago Rivers by their natural flow are properly within the Great Lakes Basin and drain into the waters of Lake Michigan. The natural flow of the waters of Lake Mich-

igan is northerly. The natural flow of the Des Plaines and Illinois River is into the Mississippi River Basin. The boundaries of the various states bordering on the Great Lakes are so extended as to include the lands under and the waters of the Great Lakes within the limits of the boundaries of the federal government. While permission to file briefs as *amici curiae* was but recently granted, to these states, citizens and municipalities of these respective states have been active for years in their opposition to the abstraction of these waters. This is apparent by reference to the record (Vol. 6, Exhibit of proceedings before the Secretary of War in connection with application of the Sanitary District for permission to divert 10,000 cubic feet of water—1912).

> "There is owned at this port several freighters of the largest class of freighting ships in the world. They combine and carry in one cargo more than one and one-half million tons from Lake Superior to the lower lakes. The depth of the connecting rivers are affected by the levels of Lakes Huron and Michigan.—The lowering of these rivers seriously affects the carrying capacity of these large steamers and we earnestly protest against—any diversion."
>
> Duluth Commercial Club, Minnesota—Rec., Vol. 6, page 3737.

> "Milwaukee Harbor Commission now engaged in the task of devising means of improving present harbor conditions and formulating plans for the city harbor * * * regards with solicitude the apparent increasing * * * lower water levels in the Great Lakes, which, if continued, must result in added expense for river and harbor maintenance and great depreciation in carrying capacity of lake tonnage."

(Diversion) "Would be fraught with detrimental results to the harbor of the City of Toledo."

Ohio, Toledo Commerce Club, Rec., Vol. 6, p. 3747.

Cleveland Chamber of Commerce, Rec., Vol. 6, p. 3748.

Board of Control of Sandusky, Ohio, Rec., Vol. 6, p. 3749.

Sandusky (Ohio) Business Men's Association, Rec., Vol. 6, p. 3749.

"Government records show that up to June 30, 1911, federal authorities had spent at Buffalo and Black Rock in waterway improvements * * * $7,932,380.68; and during the same period the citizens of Buffalo expended in the improvements of its harbor, $4,880,149.20 * * *. The level of Lake Erie was one foot five inches lower in 1911 than in 1908, attributed not only to natural causes, but to the diversion of water from Lake Michigan under the present permit. This condition in the past few years has resulted in the lowering of the loading capacity of vessels, which has been reflected in the rates charged, causing loss not only to the shipping interests but to the commercial interests as well, and as the tendency is to build larger and larger boats in order to reduce the transportation cost to a minimum, any action that will interfere with the operation of the large boats should be viewed as a public calamity."

Harbor and River Committee, Buffalo Chamber of Commerce, Rec., Vol. 6, pp. 3749-50.

Shipmasters' Association, Buffalo, Rec., Vol. 6, p. 3751.

Shipmasters' Association, Ogdensburg, N. Y., Rec., Vol. 6. p. 3751.

Lockport (N. Y.) Board of Trade, Rec., Vol. 6, p. 3752.

"The present current makes navigation (in Chicago River) difficult and any increase would seriously impair movement of vessels if not make impos-

sible handling of goods to and from industries located on river."

Signer, Association of Lake Lines, Rec., Vol. p. p. 3753.

Niagara Falls Power Co. (N. Y.), Rec., Vol. 6, p. 3754.

"During the year 1911, the critical points in the lake routes were six inches lower than the average level for the last fifty years. There is invested in lake shipping some $200,000,000.00—carrying capacity of vessels during the year 1911, was reduced over ten per cent, due to the lowering of lake levels by natural causes which must have been aggravated by the new outlet at Chicago."

Shenango Furnace Co., Pittsburgh, Pa., Rec., Vol. 6, p. 3754.

A reading of the record presented in this case shows clearly that the abstraction of the waters from Lake Michigan reduces materially the levels of all the Great Lakes and connecting waters, with the exception of Lake Superior. However, navigation of Lake Superior is materially affected by any lowering of the levels of the lower lakes and connecting waters; these determining the depths to which a boat could load in navigating to or from points, in Lake Superior and the other Great Lakes.

"The shoalest spot is the one that governs." (Appellant's narrative statement, page 147.)

The lowering of the lake levels was proceeded with by the appellant upon the theory that it was, in any event, entitled to use so much of the waters of Lake Michigan as it needed for its corporate use, and at least that the United States had authorized the consequent obstruction to navigation occasioned by such abstraction of waters. All of these contentions the states deny, the states tak-

ing the position that the waters in the Great Lakes belong to the states; held by them in trust for the use of their citizens, and that no one state or state agency may abstract these waters to the injury of the rights of the other states therein without the explicit assent of these other states; that under no circumstances can any one state, or a state agency or municipal corporation of any state, divert the waters naturally belonging to the Great Lakes Basin, so that these waters are forever lost to this basin; that the United States has not a proprietary right to these waters and is limited in the use thereof to the right of Congress to regulate the commerce carried on by means of these waters between states or between states and foreign nations.

Within the short time (Appellant's Narrative and Statement of the Pleadings, etc., together with Brief, were received by us October 22, 1924) given to the states, it was deemed inadvisable to attempt the preparation of a statement of the case independently from that statement prepared and presented in the brief of the government filed herein, and for the purposes of the presentation of the states' brief herein it is respectfully urged and prayed that we may adopt as our statement of the case, in so far as it meets the positions taken by us, the government's statement.

BRIEF.

Points and Authorities.

I.

THE STATES BORDERING ON THE GREAT LAKES, UPON BEING ADMITTED TO FULL RIGHTS OF STATEHOOD, RESPECTIVELY ACQUIRED A PROPRIETARY OWNERSHIP IN ALL THE WATERS IN THE GREAT LAKES WITHIN THE BOUNDARY LINES, AS THEN ESTABLISHED, OF THE STATES.

Martin v. *Wadell*, 16 Pet. 367, 10 U. S. (L. Ed.) 997.

Pollard v. *Hagan*, 44 U. S., 3 How. 212 (11:565).

Manchester v. *Massachusetts*, 139 U. S. 240.

Illinois Central R. Co. v. *Illinois*, 146 U. S. 387.

Kansas v. *Colorado*, 206 U. S. 46.

Port of Seattle v. *Oregon & Wash. R. Co.* 255 U. S. 56.

Barney v. *Keokuk*, 94 U. S. 324, 24 L. Ed. 224.

II.

AS OWNERS OF THE WATERS IN THE GREAT LAKES WITHIN THE BOUNDARIES OF THE RESPECTIVE STATES, THE STATES ARE ENTITLED AT ALL TIMES TO HAVE ALL THE WATERS COMING NATURALLY TO THEM, YIELDING ONLY, IF AT ALL, TO THE DEMAND OF PUBLIC COMMERCIAL NECESSITY AS ASSERTED BY APPROPRIATE CONGRESSIONAL ACTION.

Kansas v. *Colorado*, 206 U. S. 46.

Hodge v. *Eaton*, 135 Fed. 411-414.

Hudson County Water Co. v. *McCarter*, 209 U. S. 349.

Farnham on Waters (1904), Vol. I, p. 29-602.
Holyoke Water Power Co. v. *Conn. River Co.* 20 Fed. 71.
Pine v. *New York*, 112 Fed. 98.
U. S. v. *Rio Grande*, 174 U. S. 690.
Missouri v. *Illinois*, 180 U. S. 208.

III.

THE STATE OF ILLINOIS WAS WITHOUT RIGHT AS A STATE TO AUTHORIZE THE ABSTRACTION OF THE WATERS OF THE GREAT LAKES AND CONNECTING WATERS SO AS TO PERMANENTLY DIVERT THESE WATERS INTO ANOTHER WATERSHED; AND PROVIDE FOR THE EXTRAORDINARY USES OF THESE WATERS BY A STATE AGENCY OR MUNICIPAL CORPORATION OF THE STATE.

Economy Light & Power Co. v. *U. S.* 256 U. S. 113, 65 L. Ed. 847.
New York City v. *Pine*, 185 U. S. 93, 46 L. Ed. 820.
Sands v. *Manistee River Imp. Co.* 123 U. S. 288, 31 L. Ed. 149.
Farnham on Waters, Vol I, p. 59.
Withers v. *Buckley*, 20 How. 84, 15 L. Ed. 816.
Mobile County v. *Kimball*, 102 U. S. 691, 26 L. Ed. 238.
Hyde on International Law (1922), Vol. I, pp. 315-316.
Holyoke Water Power Co. v. *Conn. River Co.* 20 Fed. 71.
Ferguson v. *Arthur*, 117 U. S. 482.
Huse v. *Glover*, 119 U. S. 544, 30 L. Ed. 488.

IV.

CONGRESS HAS NOT AUTHORIZED ANY ABSTRACTION OF THE WATERS OF LAKE MICHIGAN AS IS CLAIMED BY APPELLANT.

(a) The Act of Congress of March 2, 1827, cannot be construed as authorizing any diversion or abstraction of waters from Lake Michigan.

(b) The Secretary of War was without power to authorize any abstraction of such waters.

Hubbard v. *Fort*, 188 Fed. 987.

Act of Congress, March 2, 1827 (4 Stats. at L., p. 234).

Separate Section 3, Constitution of Illinois, 1870.

U. S. v. *Rio Grande Dam & I. Co.* 174 U. S. 706.

V.

CONGRESSIONAL AUTHORITY FOR ABSTRACTION OF WATERS OF LAKE MICHIGAN MUST BE BASED SOLELY UPON COMMERCIAL IMPROVEMENT OF THE WATERS OF LAKE MICHIGAN OR IMPROVEMENT OF COMMERCE.

(a) Congress has no authority to authorize diversion except as exercised under its constitutional power to regulate commerce.

(b) The only right in and to the waters of Lake Michigan on the part of Congress is the right to use these

waters as an avenue of commerce or commercial regulation.

Port of Seattle v. *Oregon & Wash. Ry. Co.* 255 U. S. 56, 65 L. Ed. 500.

ARGUMENT.

I.

THE STATES BORDERING ON THE GREAT LAKES, UPON BEING ADMITTED TO FULL RIGHTS OF STATEHOOD, RESPECTIVELY ACQUIRED A PROPRIETARY OWNERSHIP IN ALL THE WATERS IN THE GREAT LAKES WITHIN THE BOUNDARY LINES, AS THEN ESTABLISHED, OF THE STATES.

In the case of

The Port of Seattle v. *Oregon & Washington Ry. Co.* 255 U. S. 56, 65 L. Ed. 500,

on the question as to whether or not the Oregon & Wash. Ry. Co. acquired, as owner of lands adjoining sea waterway in The Port of Seattle, the right to build in the waterway piers, wharves and other structures over which it could secure access from its land to the navigable channel, Mr. Justice Brandeis, in delivering the opinion of the court, said:

> "The right of the United States in the navigable waters within the several states is limited to the control thereof for purposes of navigation. Subject to that right Washington became, upon its organization as a state, the owner of the navigable waters within its boundaries and of the land under the same. (*Weber* v. *State Harbor Com.* 18 Wall. 57, 21 L. Ed. 798.) By section one of article 17 of its Constitution, the state asserted its ownership in the bed and shore 'up to and including the line of ordinary high tide, in waters where the tide ebbs and flows.' The extent of the state's ownership of the land is more accurately defined by the decision of the highest court, as being the land below high-water mark, or the meander line, whichever of these lines is the lower. The character of the state's ownership in the land and in the waters is the full proprietary

right. The state, being the absolute owner of the tide lands and of the waters over them" * * *

In

Barney v. *Keokuk*, 94 U. S. 324, 24 L. Ed. 224,

the court said:

"and since this court, in the case of *The Genesee Chief* v. *Fitzhugh*, 12 How. 443, 13 L. Ed. 1058, has declared that the Great Lakes and other navigable waters of the country, above as well as below the flow of the tide, are, in the strictest sense, entitled to the denomination of navigable waters, and amenable to the admiralty jurisdiction, there seems to be no sound reasons for adhering to the old rule as to the proprietorship of the beds and shores of such waters. It properly belongs to the states by their inherent sovereignty, and the United States has wisely abstained from extending (if it could extend) its survey grounds beyond the limits of high water."

Above citation was quoted with approval by Mr. Justice Brewer in *Kansas* v. *Colorado*, 206 U. S. 46.

Touching upon this matter, in the case of

Martin v. *Wadell*, 16 Pet. 367, 10 U. S. L. Ed. 997,

the court held:

"That when the American Revolution was concluded, the people of each state became themselves sovereign, and in that character held the absolute right to all their navigable waters and the soils under them for their own common use, subject only to the rights since surrendered by the Constitution to the general government."

II.

AS OWNERS OF THE WATERS IN THE GREAT LAKES WITHIN THE BOUNDARIES OF THE RESPECTIVE STATES, THE STATES ARE ENTITLED AT ALL TIMES TO HAVE ALL THE WATERS COMING NATURALLY TO THEM, YIELDING ONLY, IF AT ALL, TO THE DEMAND OF PUBLIC COMMERCIAL NECESSITY AS ASSERTED BY APPROPRIATE CONGRESSIONAL ACTION.

"A river which flows through the territory of several states or nations is their common property. Each is entitled to its navigation throughout its whole extent, so far as it can be exercised without injury to the rights of others. It is a great natural highway conferring, besides the facilities of navigation, certain incidental advantages, such as, fishery and the right to use the water for power. Neither nation can do any act which will deprive the other of the benefits of those rights and advantages. The inherent right of a nation to protect itself and its territory would justify the one lower down the stream in preventing by force the one further up from turning the river out of its course or in consuming so much of the water for purposes of its own as to deprive the former of its benefit. * * * Courts, having a supervisory jurisdiction over the acts of the political department of government, will prevent acts by that department which will injure the rights of the neighboring states. The gifts of nature are for the benefit of mankind, and no aggregation of men can assert and exercise such rights and ownership of them as will deprive others having equal rights, and means of enjoying them, of such enjoyment. The acts of nations must be governed by principles of right and justice. The days of force and self-aggrandizement at the expense of neighboring nations are passed, and the common right to enjoy the bountiful provisions of Providence must be preserved."

Farnham on Waters (1904), Vol. I, p. 29.

Hudson County Water Co. v. *McCarter*, 209 U. S. 349.

This is a case in which the defendant under a contract with the City of Bayonne, in New Jersey, first laid mains in that city for the purpose of carrying waters to Staten Island in the State of New York. By their contracts it is to get the water from the Passaic River at Little Falls, where the East Jersey Water Co. has a large plant by which the water is withdrawn. The State of New Jersey enacted legislation making it unlawful for any person or corporation to transport or carry the waters of any lake or pond or stream in the state into another state for use therein. In the opinion, delivered for the court by Mr. Justice Holmes, it was said:

> "We are of the opinion further that the constitutional power of the state to insist that its natural advantages shall remain unimpaired by its citizens is not dependent upon any nice estimate of the extent of present use or speculation as to future needs. * * * It finds itself in possession of what all admit to be a great public good, and what it has it may keep and give no one a reason for its will."

In discussing this case in the lower court, 70 New Jersey Equity 695, Justice Pitney said:

> "It will, of course, be observed that the case before us is not at all parallel to the case that would be presented were the state of New Jersey or citizens thereof setting up a right to interfere with the flow of water that otherwise would, in its natural course, reach the territory of a neighboring state. Such a case was presented in *New York City* v. *Pine*, 185 U. S. 93, 22 U. S. Sup. Ct. Rep. 592. There the City of New York constructed a dam on the west branch of Byram River, within the state of New York, this being a non-navigable stream of fresh water arising in New York, flowing thence through the state of Connecticut, and emptying into Long Island Sound. The plaintiffs were riparian owners of land in the state of Connecticut, and brought action in federal Circuit Court for an injunction to restrain the city from diverting the waters of the west branch from their natural flow through the

plaintiff's lands. *The Supreme Court assumed, without deciding, that although the west branch above the dam and all the sources of the supply of water to that branch are within the limits of the state of New York, that state has no power to appropriate such water or prevent its natural flow through through its customary channel into the state of Connecticut.* The injunction was denied, however, and the right of the plaintiffs to pecuniary compensation established in its stead, on the ground of their acquiescence in the construction of the works by means of which the diversion was to be effected.

In the great case of *Kansas* v. *Colo.* 185 U. S. 125, 22 U. S. Sup. Ct. Rep. 592 (decided on demurrer, but not yet determined on final hearing), the state of Kansas, partly on the basis of its ownership of riparian land upon the Arkansas River and partly in the right of its citizens who are riparian owners thereon, is seeking to enjoin the state of Colorado from withdrawing from the river for irrigation of the arid lands of Colorado so much of the waters of the river as to materially injure the riparian lands in Kansas. A demurrer to the bill was overruled on the ground that in a case of so great importance a determination of the questions involved ought to be left until the facts were established by proofs. *Impliedly the right to prevent an undue interference with the natural flow of the river was recognized.*"

In the *Hodge* v. *Eaton*, 135 Fed. 411, in a suit by settlers in Wyoming, on a stream which arises in Colorado, to restrain the diversion of water from such stream in Colorado, the court stated the following to be a general principle:

> "*The idea of an exclusive right in the people of a state to divert its running waters to the injury of riparian owners in another state must be equally unattainable. Indeed, the doctrine of riparian ownership and use of running water is not subject to political boundaries. Between hostile states the doctrine must be recognized, but any such repudiation would be simply vis major. Between states dwelling in peace and concord, as are the states of our Union, the equal rights of the inhabitants of*

each state to the waters of intersecting streams must always be recognized.''

One state cannot authorize changes in the river which will injure property in another state.

Holyoke Waterpower Co. v. *Connecticut River Co.* 52 Conn. 570; 22 Blatchf. 131, 20 Fed. 71,

and the upper state cannot divert the water to the injury of property or the destruction of navigation lower down, and attempts to do so will be restrained by courts having jurisdiction of the parties.

Pine v. *New York,* 50 C. C. A. 145, 112 Fed. 98.
Kansas v. *Colo.* 185 U. S. 125, 46 L. Ed. 838, 22 Sup. Ct. Rep. 552.
U. S. v. *Rio Grande,* 174 U. S. 690, 43 L. Ed. 1136.

Nor has the upper state a right to pollute the water in such a way as to render it unfit for domestic use in the lower one.

Missouri v. *Illinois,* 180 U. S. 208, 45 L. Ed. 497, 21 Sup. Ct. Rep. 331.

In support of the contentions herein urged, reference is made to the case of

Kansas v. *Colorado,* 206 U. S. 46.

The waters of the Great Lakes are owned by the respective states in a proprietary sense. The holding is in trust for all its citizens for uses of navigation, fishing, etc. The holding by the state is not in the strict sense that of a riparian owner, that right to the use of waters arising from being the owner of the banks along a stream, but is rather in the capacity of a conservator, standing ever as the guardian of the people's right to use these waters for navigation and other lawful uses, seeing that these uses are in no way ever curtailed or destroyed. As

to these Great Lakes, the duty of each state to the other is to so use these waters as not to abridge to any extent the rights of the other states. If the lower riparian owner on a stream may claim, as against the upper riparian owner, the right to a continued, uninterrupted flow of the stream passing his lands, why may not the lower state then claim, as against the upper state, the same right as one of its citizens could claim against a citizen of another state? While a riparian owner on a navigable stream can claim but the right to the use of the water, the states' claim in this instance is to the full proprietary ownership of these waters. True, that the waters themselves being of a wandering, transient nature, the precise waters which were within the boundaries of the particular border state when admitted to the Union did not continue to remain in the state, and when these waters passed out in a natural manner the state lost its property in them, but at the same time gained a property to those waters naturally coming in to replace those naturally leaving. But, at the time of its admission into the Union, the quantity of the waters under state ownership and sovereignty was fixed and the state was entitled to assert its sovereignty and ownership over such quantity and all natural additions thereto as against any and all unnatural diversion or abstraction.

III.

THE STATE OF ILLINOIS WAS WITHOUT RIGHT AS A STATE TO AUTHORIZE THE ABSTRACTION OF THE WATERS OF THE GREAT LAKES AND CONNECTING WATERS SO AS TO PERMANENTLY DIVERT THESE WATERS INTO ANOTHER WATERSHED AND PROVIDE FOR THE EXTRAORDINARY USES OF THESE WATERS BY A STATE AGENCY OR MUNICIPAL CORPORATION OF THE STATE.

Appellant attempts to justify its right to abstract these waters from Lake Michigan, and indeed any amount of water which the State of Illinois may determine as proper, by reason of the powers conferred upon it under the Illinois Act of May 29, 1889 (Appellant's Brief and Argument, p. 155) asserting that the State of Illinois has reserved to it the police power to take the amount of water reasonably required for the purposes designed—namely, the protection of the water supply of Chicago and its environs.

The states herein recognize the principle that Illinois, under its police powers, should take all necessary steps to protect the water supply of the state, but it is respectfully submitted that in the exercise of this police power the State of Illinois was not justified in authorizing any unreasonable use and abstraction of the waters of the Great Lakes to the injury of the navigability of the Great Lakes and connecting waters, and the rights of the respective border states to their respective rights to the use of these same waters for navigation, development of water power and other lawful uses.

That the use of these waters being made by appellant is an extraordinary use; that is, extraordinary as to the

purpose for which the water is taken as well as the amount of water used, needs no argument.

It is undisputed in the record that the abstraction of 10,000 cubic second feet of water by appellant reduces the levels of the Great Lakes and connecting waters at various places of from four and five-tenths inches to six and nine-tenths inches, and that any reduction of the levels of these waters necessarily tends to nullify costly improvements heretofore made throughout the Great Lakes, both by the states and the federal government, and that a withdrawal of 10,000 cubic feet per second would nullify the expenditures made throughout the Great Lakes under authority of Congress to the amount of many millions of dollars, as well as inflicting a great loss on the navigation interests using these waters, and a loss to the states using these waters for power purposes. (See Rec., Vol. 8, pp. 52, 53, 54.)

In

Economy Light & Power Co. v. *U. S.* 256, pp. 113, 65 L. Ed. 847,

suit was brought by the United States to restrain defendants from constructing a dam in the Des Plaines River at a point in Grundy County, Ill., without the consent of Congress or authority of the legislature of the state:

> "The public interest in navigable streams of this character in Illinois and neighboring states, and the Federal authority over such as are capable of serving commerce among the states, do not arise from custom or implication, but have a very different origin. By article 4 of the compact in the Ordinance of July 13, 1787, for the government of the territory northwest of the River Ohio, it was declared: 'The navigable waters leading into the Mississippi and St. Lawrence, and the carrying places between the same, shall be common highways, and forever

free, as well to the inhabitants of the said territory, as to the citizens of the United States, and those of any other states that may be admitted into the Confederacy, without any tax, impost or duty therefor.'" * * * "To the extent that it pertained to internal affairs, the Ordinance of 1787—notwithstanding its contract form—was no more than a regulation of territory belonging to the United States, and was superseded by the admission of the state of Illinois into the Union 'on an equal footing with the original states in all respects whatever.' *But so far as it established public rights of highway in navigable waters capable of bearing commerce from state to state, it did not regulate internal affairs alone, and was no more capable of repeal by one of the states than any other regulation of interstate commerce enacted by the Congress.*"

In construing the provisions of the fourth section of the ordinance for the government of the northwest territory (Ordinance of 1787), Mr. Justice Fields said:

> "The provision of the clause that the navigable streams should be highways without any tax, impost or duty *has reference to their navigation in their natural state. It did not contemplate that such navigation might not be improved by artificial means, by the removal of obstructions or by the making of dams for deepening the waters, or by turning into the rivers waters from other streams to increase their depth.*"
>
> *Huse* v. *Glover*, 119 U. S. 544, 30 L. Ed. 488.

It does then appear that the provisions of the ordinance of 1787, for the government of the northwest territory, in so far as these provisions establish the public rights of interstate navigation in the Great Lakes still remain as binding upon all the states in their relation to each other and to the federal government. The right of navigation is the first great right to which these

waters are dedicated, and any other use of these waters affecting their navigable capacity is prohibited.

> "Any duty imposed upon a riparian state, either by international law or by contract to maintain the navigability of an international river, implies an obligation also to check within places subject to the control of such state the commission of any acts which, unless restricted would prove injurious to navigation.
>
> This obligation would seem to render improper the tolerance of any diversion productive of such an effect even though it should occur at a point where the river ceased to be navigable and lay wholly within the domain of the acquiescent territorial sovereign."
>
> Hyde International Law, 1922, Vol. 1, 315-316.

In

New York v. *Pine*, 185 U. S. 93, 46 L. Ed. 821,

Mr. Justice Brewer, delivering the opinion of the court, said:

> "Without deciding, *we assume that*, although the west branch above the dam and all the sources of supply of water to that branch are within the limits of the state of New York, it has no power to appropriate such water or prevent its natural flow through its accustomed channel into the state of Connecticut; that the complainants have a legal right to the natural flow of the water through their farms in the state of Connecticut and cannot be deprived of that right by and for the benefit of the City of New York or by any legal proceedings either in Connecticut or New York."

In

County of Mobile v. *Kimball*, 102 U. S. 691, 26 L. Ed. 238,

> "The improvement of harbors and bays and navigable rivers *within the states* may be regulated by state authority, *if it does not impair their free navigation as permitted under the laws of the United*

States, nor defeat any system for the improvement of their navigation provided by the general government."

In

Holyoke Water Power Co. v. *Connecticut River Co.* 20 Fed. p. 71,

"The improvement of the navigation of navigable rivers within a state is a part of the state's governmental duties * * * and * * * the riparian proprietor within the state is subject to the just exercise of this (governmental) power. The land is under the jurisdiction of the state and the state derives the power to inflict remote and consequential injuries upon it by virtue of such jurisdiction. Jurisdiction confers the power and the right to inflict consequential injury, but where no jurisdiction exists, the right ceases to exist. It is a recognized principle that the statute of one state in regard to real estate cannot act extraterritorially. As Connecticut has no direct jurisdiction or control over real estate situate in another state, it cannot indirectly, by virtue of its attempted improvement of its own navigable waters, control or subject to injury foreign real estate."

If as proprietors of these waters the states cannot object when one of the states insists upon taking these waters and forever destroying them by abstraction so that these states are denied any future use of these waters, it would seem absurd for the courts to say that the states' right to these waters is a "full proprietary one."

"'Proprietary' as defined by the Imperial Dictionary, means belonging to; ownership, as proprietary rights. By Webster, as belonging or pertaining to a proprietor; 'proprietor' being defined as one who has the legal right or exclusive title to anything whether in possession or not; an owner."

Ferguson v. *Arthur*, 117 U. S. 482, 29 L. Ed. 979.

Here one state desires to take away from each of these states of from three to five inches level of the Great Lakes' waters. Should Illinois authorize a municipal corporation of that state to dump solid matter on the bottom of all the lakes to an extent of three-inch thickness, there would be no question about the right of the other states to prevent this, and certainly such offending municipal corporation could not justify its act on the grounds of permission derived from an Illinois state statute. When the Illinois statute attempted to give to the appellant the right to abstract waters from Lake Michigan for the extraordinary purpose of washing sewage away from the City of Chicago and its environs, and in the extraordinary amounts indicated in the statute, it was in effect granting to the appellant the right to take property belonging to all of these states and this, obviously, it could not do.

The withdrawal from Lake Michigan through the Drainage Canal of 10,000 c. f. s. obviously means so much less flowing through the Niagara and St. Lawrence Rivers. The aggregate fall or head on the Niagara and that part of the St. Lawrence forming the international boundary line, is approximately 400 feet. This amount of water if allowed to flow in its natural course is capable of developing on the St. Lawrence and Niagara Rivers 400,000 constant horsepower of electrical energy—the equivalent of from three to four millions tons of coal—annually.

The State of New York is more directly interested in the question of hydro-electric power development, than the other states in whose behalf this brief is presented, but the States of Pennsylvania, Ohio and Michigan, on account of their proximity to the Niagara and St. Lawrence Rivers, are deeply interested in this question.

Hyro-electric power developed on the St. Lawrence and Niagara Rivers may very easily be made available for use in the three states last mentioned. It is a fact that there is now being constructed by the New York, Lockport & Ontario Power Company, a transmission company in the western part of New York state, a transmission line from Niagara Falls to Warren, Pa., to connect with the transmission lines of the Pennsylvania Electric Corporation, which last named company has transmission lines extending across the State of Pennsylvania into the State of Maryland.

The development and distribution of 400,00 hydro-electric horsepower among the industries of these four states means a tremendous saving in the coal resources of the country, and as a broad proposition is of sufficient importance to the public to require the Sanitary District, within a reasonable time, to replace the present unscientific system for sewage disposal with some other more scientific and standardized system.

In presenting this point and the above statement, we have not overlooked the testimony of Mr. Isham Randolph, consulting engineer for the Sanitary District, found in the record, Vol. VI, at pages 3598, 3599. Mr. Randolph has undertaken to state the value to the Sanitary District of the power capable of development from the 10,000 c. f. s. diverted through the drainage canal. His statement that 30,000 horsepower can be developed at Lockport is substantially correct. His further statement of the amount of power capable of development from 14,000 c. f. s. is also substantially correct, but the significance of the statement of the amount of power capable of development from 14,000 c. f. s. is that it is the intention of the Sanitary District to ultimately withdraw 14,000 c. f. s. rather than to be limited to the withdrawal of even 10,000 c. f. s.

The amount of power capable of development from 10,000 c. f. s. and 14,000 c. f. s. respectively, on the Des Plaines and Illinois Rivers below Lockport, is not a material fact in the determination of the question before this court. If any weight is to be given to the fact that the withdrawal of 10,000 c. f. s. or 14,000 c. f. s. from Lake Michigan, through the Des Plaines and Illinois Rivers by way of the drainage canal, increased the volume of water flowing through these rivers and thereby makes possible a development of any amount of power, the question resolves itself into one of water power or hydro-electric power development, and we are getting away from the proposition that the real and avowed purpose of the Sanitary District in withdrawing water from Lake Michigan, under the Illinois statute, is to provide a system of sewage disposal for the people of Chicago and adjacent territory.

Mr. Randolph has further undertaken to state the amount of power that 10,000 c. f. s. will develop at Niagara Falls on the Niagara River, and also he has undertaken to state the price at which power sells at Niagar Falls, to wit, $9.50 per horsepower. He has not qualified or shown that he has any knowledge of the price at which power is sold at Niagara Falls. His statement that 10,000 c. f. s. developed by the *Shellcock* Company (Schoellkopf Company), under a head of 200 feet, and 80 per cent efficiency, will produce 181,000 horsepower, is erroneous. It is a fact well known to the War Department, and other departments of the government, that the development of the Schoellkopf Company is under a mean head of 215 feet; that its efficiency is above 90 per cent; and, that the amount of power which it is actually producing from the use of 19,500 c. f. s. is over 400,000 horsepower.

The above is a statement of present conditions. Mr. Randolph, in his testimony, referred to conditions in the year 1914 which were somewhat different from the present conditions. His statement that power sells at Niagara Falls for $9.50 per horsepower is obviously erroneous. It is a fact well known and understood among engineers and in the hydro-electric world generally, that on the Canadian side, at Niagara Falls, at an early date, a contract was made by one company for the sale of hydro-electric power at that price. No hydro-electric power has ever been sold at that price on the American side. We are assured by the Niagara Falls Power Company (the successor of the Schoellkopf Company and other companies), the only company developing hydro-electric power on the American side of the Niagara River, that the average price of hydro-electric power developed on the American side of the Niagara River, for several years before the year 1914, was not less than $16 per horsepower, and that the price for which such power has sold from that time to the present time is $20 per horsepower.

The Sixty-fifth Congress, by Public Resolution No. 8, authorized the Secretary of War, among other things,—

> "To make a comprehensive and thorough investigation, including all necessary surveys and maps, of of the entire subject of water diversion from the Great Lakes and the Niagara river, including navigation, sanitary and power purposes, and the preservation of the scenic beauty of Niagara Falls and the rapids of Niagara river, and to report to Congress thereon at the earliest practicable date."

The work provided for by the above resolution was entrusted by Major General Beach, chief of engineers of the army, to Col. J. G. Warren, corps of engineers, division engineer, Lake Division. The work entrusted to Colonel Warren was undertaken by him and his as-

sistants, and performed with great thoroughness. The work was completed by him in 1919, and on August 30th of that year he made his report to the chief of engineers of the United States Army. On November 19, 1920, the chief of engineers transmitted this report to the Secretary of War. On the 7th of December, 1920, the Secretary of War transmitted the same to the Congress. This report is commonly known as "The Colonel Warren Report," and is the best authority extant on the subjects therein treated.

This subject is quite fully discussed in Colonel Warren's report at pages 93, 94, 398, 399, 400. On pages 93 and 399, there are statements showing the comparative cost of producing steam electric power and hydro-electric power at Niagara Falls, and the estimated price at which such power might be sold in large blocks to the public. The estimated price of steam electric power to the public, in large blocks, is $50.70 per horsepower, while the estimated price of hydro-electric power to the public, in large blocks, is $19.50 per horsepower.

The purpose of referring to Mr. Randolph's testimony is to point out to the court that certain statements made by him are erroneous; that the average price of electrical power to the public, in large blocks, on the American side previous to 1914 was not less than $16 per horsepower; that the average price at the present time is $20 per horsepower; that the cost of producing hydro-electric power on the Niagara River, and the price for which the same can be furnshed to the public are in any event much less than on the DesPlaines or Illinois Rivers, and that so far as the question of hydro-electric power development is related to the withdrawal of water from Lake Michigan by the Sanitary District, the development and sale of power from that volume of water is much more

beneficial to the general public if developed on the Niagara and St. Lawrence Rivers, and means a very large economic saving.

Mr. Randolph, in his testimony, made no reference to the re-use of water on the St. Lawrence River and the amount of power capable of development at that point from the water withdrawn from Lake Michigan through the Sanitary Canal. 10,000 c. f. s. on that part of the St. Lawrence River forming the international boundary line is capable of developing approximately 100,000 horsepower at a cost which will permit its sale to the public, in large blocks, at about the same price as power developed at Niagara Falls on the American side.

The conditions at Niagara Falls are recognized and commented up by the Federal Power Commission in its First Annual Report, at pages 8-10. We quote the following from page 9:

> "The Niagara plants, among the first to be constructed in this country, developed only 10.6 horsepower per second-foot of water. Modern design will permit of 19 horsepower."

The improved development which has been made by the Niagara Falls Power Company actually develops over 20 horsepower per second-foot of water. This improved development is under a mean head of 215 feet. If the development were under the full head of upwards of 300 feet possible on the Niagara River between Niagara Falls and Lake Ontario, there would be obtainable 30 horsepower for each second-foot of water.

IV.

CONGRESS HAS NOT AUTHORIZED ANY ABSTRACTION OF THE WATERS OF LAKE MICHIGAN AS IS CLAIMED BY APPELLANT.

The Act of Congress of March 2, 1827, cannot be construed as authorizing any diversion or abstraction of waters from Lake Michigan.

Appellant, by a most interesting, if not convincing, argument attempts to connect its right to the abstraction of waters from Lake Michigan with the provisions of the Act of Congress of March 2, 1827. (Appellant's Brief, p. 115.)

The State of Illinois had in 1827 authority to construct canals. Congress, to aid the state to construct a canal to connect the waters of the Illinois River with those of Lake Michigan, made, under the said Act of 1827, a grant of lands, the revenue from the sale of which lands so granted could be used to aid in the contemplated canal construction. To take advantage of the grant, the construction of the canal was to be commenced within five years and completed within twenty years. The canal contemplated by this Act of 1827 was to be a navigable public highway for the transportation of persons and property, and such a one as would suit the needs of commerce. This is emphasized when we read the Amendment to this Act of March 2, 1827, made by the Act of March 2, 1833, (4 Statutes at Large, page 662), under the terms of which the lands granted under the Act of March 2, 1827, could be "used and disposed of by said state, for the purpose of making a railroad instead of a canal as in said act contemplated; and that the time for commencing and completing said canal or railroad, whichever the State of Illinois may choose to make, be and is extended five years:"

Illinois chose to build a canal instead of a railroad. The title of the Act of March 2, 1827, uses the words "connect the waters," while Section one of the act the words "unite the waters" are used. Neither "a connection" or "a uniting" of the waters contemplated, inferred nor authorized an abstraction or diversion or any of these waters. The canal actually constructed by the state, "had a summit of eight feet above Lake Michigan, and it was fed in ordinary seasons from the Des Plaines River and by a feeder through the Sag Valley and the Calumet River at Blue Island." (Rec., Vol. 3, p, 1716—Appellant's Narrative Statement, p. 269.)

That the state understood that the Act of March 2, 1827, did not contemplate any abstraction of the waters of Lake Michigan is best illustrated by the method in which the state acted under its authority to construct this canal.

That there can be no possible connection between the navigation canal authorized by the Act of March 2, 1827, and the Sanitary Canal built by the appellant is plain.

Since the adoption of its Constitution of 1870, the State of Illinois is without authority to loan its credit or make appropriations in aid of canals. The constitutional provision referred to reads as follows:

> "The Illinois and Michigan canal shall never be sold or leased until the specific proposition for the sale or lease thereof shall first have been submitted to a vote of the people of the State at a general election, and have been approved by a majority of all the votes polled at such election. The General Assembly shall never loan the credit of the State, or make appropriations from the treasury thereof, in aid of railroads or canals: Provided, that any surplus earnings of any canal may be appropriated for

its enlargement or extension." (Const. 1870, separate sec. 3; Starr & Cur. Stat. 1896, p. 206.)

In the case of

Burke v. *Snively*, 208 Ill. 328-348,

Mr. Justice Boggs, delivering the opinion of the court, in construing the above cited section of the Illinois Constitution of 1870, held that this section prohibited an appropriation by the legislature in aid of the Illinois and Michigan Canal, which is the canal constructed by the State of Illinois with the aid of the money derived from the sale of the lands granted to the State of Illinois under the provisions of the aforesaid Act of Congress of March 2, 1827. In his opinion, Justice Boggs said, among other things:

> "Though it does not aid to the determination of the question of the power of the legislature to make the appropriation in question, it is not inappropriate to remark that the fears entertained by members of the constitutional convention that more modern and more speedy means of transporting passengers and commodities would soon supplant the canal and divert traffic from it, and the canal would become practically of no use as a waterway or highway of traffic and commerce and would cease to produce an income sufficient to pay the expenses connected with its management, and would, unless restrained by the constitution, become a regular applicant at the door of the State treasury for appropriations of money of the tax-payers of the State, *have been verified*. In 1876 the tolls received for the use of the canal aggregated $113,293, but since that year there has been a marked and substantially gradual decrease in such receipts. In 1900 so little demand was there for the canal as a highway or waterway for transportation of persons or property that but $13,867 were paid as tolls. In 1901 the use of the canal for the purpose of trade or commerce was so little availed of that but $8120 were collected from tolls. The gross receipts were much larger in all

the years than the sums stated, but the excess arose from sales of ice privileges and sales of water power. But in addition to all receipts, of every character, during these years, heavy appropriations from the treasury of the State, amounting to something more than one-half a million dollars, have been asked and obtained from the public treasury to meet the deficiencies arising from the management and operation of the canal. The canal has practically fallen into disuse for any of the purposes of transportation of either persons or property, and has been perverted to mere commercial purposes of supplying water power to those along its banks and selling privileges to cut ice from its pools. It is no longer a highway of commerce." (The opinion was filed Feb. 17, 1904.)

The appellant was created as a "Sanitary District" under the provisions of the Act of Illinois of May 29, 1889, "An Act to create Sanitary Districts, etc." (Rec., Vol. 8, p. 90.)

It was said in *Chicago* v. *Green*, 238 Ill. 258, "The purpose of the Act of 1889 was to furnish a common outlet for the sewage of the incorporated municipalities within the limits of the district," and in *People* v. *Nelson*, 133 Ill. 565, "A Sanitary District is a municipal corporation organized to secure, preserve and promote the public health." Within the limits of the title and the body of the act under which appellant exists and operates, while navigation might be the result, it could not be the object of the construction of any drain or canal by this appellant. A sanitary canal built by the appellant may result in being used, in part, as a navigation canal, but the Sanitary District, the appellant, would have to justify the existence of any of its canals upon the ground that such canal was built solely to meet the needs of sanitation.

While the construction of a navigation canal was en-

tirely foreign to the act under which appellant derives its powers, nevertheless the record shows that more than $15,000,000 of the expenditures actually made upon the Chicago Drainage Canal by this appellant was distinctly for the benefit of navigation. (Rec., Vol. 3, pp. 1176-1177.)

Obviously there can be no connection between the navigation canal mentioned in the Act of Congress of March 2, 1827, and appellant's Sanitary Canal.

The Secretary of War Was Without Power to Authorize Any Abstraction of Such Waters.

The permit issued by the Secretary of War on the 8th day of May, 1899, was based upon the provisions of Section 10 of the Rivers and Harbors Act of March 3, 1899. This permit authorized the diversion of 300,000 cubic feet per minute of the waters of Chicago River so as to cause them to flow into the artificial channel constructed by the appellant. So far as we have searched the record we are unable to find any instance where the work of an abstraction of the waters of the Great Lakes, at least beyond 4,167 cubic second feet, has ever been recommended by the chief of engineers U. S. Army. It is apparent that in all proceedings before the Secretaries of War, that the Secretaries were persuaded by such reports as were given to them by the chief of engineers that the particular "work" of abstraction of Lake Michigan waters would be "an obstruction to the navigable capacity" of the Great Lakes. Secretary of War, Hon. Henry L. Stimson, emphasized this, when in denying the application of the appellant to abstract 10,000 cubic second feet, he said:

> "It is clear that even under the conditions heretofore manifested on these applications, the propo-

sition to divert the waters of Lake Michigan into another watershed has not been entertained without hesitation and careful restriction by my predecessors. The propriety of obtaining congressional sanction for the project has been pointed out from the beginning; and the form in which the permit has been granted, even for the moderate amount of diversion permitted, has been so phrased as to indicate that the permission was predicated upon the absence of any substantial injury to commerce. The sanitary canal has never received the direct sanction of Congress."

It also seems clear that the Secretaries of War construed the Rivers and Harbors Acts of 1890 and 1899 to mean and provide that the Secretary of War, under these acts, could not legally authorize any work of "altering or modifying the course, condition and capacity" of the Great Lakes, or other navigable waters of the United States when it was apparent that such work would obstruct the navigable capacity of the waters, unless and before Congress, by affirmative congressional action, authorized the particular work of obstruction. The conclusions reached by the Secretary of War upon denying the aforesaid application for the abstraction of 10,000 cubic second feet, indicate the construction placed upon the Rivers and Harbor Act of 1899. The conclusions are as follows:

"*First.* That the diversion of 10,000 cubic feet per second from Lake Michigan, as applied for in this petition, would substantially interfere with the navigable capacity of the navigable waters in the Great Lakes and their connecting rivers.

Second. That that being so, it would not be appropriate for me, without express congressional sanction, to permit such a diversion, however clearly demanded by the local interests of the sanitation of Chicago.

Third. That on the facts here presented no such case of local permanent necessity is made evident." (Rec., Vol. 8, page 58.)

It is also clear that at the time of the original authorization by the Secretary of War, May 8, 1899 (Rec., Vol. 8, pages 44-45), that the only contemplated "obstruction to the navigable capacity of the waters of the United States" was as to the waters of the Chicago River. As the exact effect upon the Great Lakes and connecting waters of abstracting a given amount of water therefrom could only be ascertained after prolonged observations (Appellant's Narrative Statement, page 514), it is evident that it was apparent at the time this permit for the abstraction of 4167 cubic second feet was given that an obstruction to the navigable capacity of the Great Lakes and connecting waters was not contemplated. The reduction in the amount authorized, made by Secretary of War, Hon. Elihu Root (April, 1901), was directed at obstructions to the navigability of the Chicago River. (Rec., Vol. 8, page 46.) So, too, were the official authorizations of the War Department secretaries, *until* the application of the Sanitary District for an increased abstraction of these waters was considered by Secretary of War, Hon. Henry L. Stimson, during the time from February 5, 1912, to January 8, 1913. (Rec., Vol. 8, pages 48, 49, 50.)

It seems clear, from an examination of the provisions of Sections 9 and 10 of the Rivers and Harbors Act of March 3, 1899 (U. S. Stat. at L., Vol. 30, page 1121), that affirmative congressional action must be taken with regard to any construction or work which will obstruct the navigable capacity of any of the waters of the United States, and for authorization to construct any bridge, dam, dike or causeway over or in any port * * * canal * * * or other navigable water of the United States, except when the bridge, etc., is across rivers and other waterways, the navigable portions of which lie

wholly within the limits of a single state and such structures are being erected under authority of the legislature of that state. Wharves, piers, etc., built under the provisions of Section 10 may be constructed if they do not obstruct the navigable capacity of any of the waters of the United States when the plans for such construction have been recommended by the chief of engineers and authorized by the Secretary of War. So, too, under the provisions of Section 10, the work of excavating, filling, altering or modifying the course, etc., of any port * * * canal * * * or the channel of any navigable water of the United States may be undertaken when recommended by the chief engineer and authorized by the Secretary of War, and the work so undertaken does not obstruct the navigable capacity of any of the waters of the United States.

A construction of the aforesaid Rivers and Harbors Act of Congress, of March 3, 1899, was made by the court in the case of

Hubbard v. *Fort*, 188 Fed. 992.

It was there said:

> "Upon the only ground of demurrer considered, the question is thus reduced: Is this authority from the Secretary of War plenary or merely permissive? So far as applicable to the present question, such section may be summarized thus: *First*, the creation of any obstruction to the navigable capacity of any waters of the United States is prohibited unless affirmatively authorized by Congress; *second*, it shall not be lawful to build any structure in a navigable river or water of the United States, except on plans recommended by the Chief of Engineers and authorized by the Secretary of War; and, *third*, it shall not be lawful to excavate or fill the channel of any navigable water of the United States unless such work is recommended by said Secretary of War prior to beginning the same.

This section was construed in *Cobb* v. *Lincoln Park*, 202 Ill. 427, 67 N. E. 5, 63 L. R. A. 264, 95 Am. St. Rep. 258, and *Wilson* v. *Hudson County Water Co.*, 76 Atl. 560. In both of these it was held that the Secretary of War's authorization was a mere license to do the work and not a grant of power to do it. In the latter case V. C. Walker, adopting the view of the Illinois court, said: 'The doctrine of *Cobb* v. *Lincoln Park* as applicable to the case under consideration may be paraphrased as follows: The provisions of Section 10 of the Rivers and Harbors Act of March 3, 1899, were designed to protect the navigable waters of the United States from encroachment and from obstructions to navigation, and to commit the duty of their protection to an officer of the general "government without whose permission no such obstructions can be made; that the act is a mere regulation for the benefit of commerce and navigation, and that the license or permission of the Secretary of War is only a finding and declaration that a proposed structure or excavation would not interfere with or be detrimental to navigation, *and is not equivalent to a positive declaration by the authority of Congress that the licensee may make such obstruction or excavation without first obtaining the consent of the owner of the submerged land;* that the act is not a declaration touching the rights of the owner of the submerged lands in question, and, assuming that the permission of the general government to the excavation and laying of the proposed pipe line is necessary, such permission is not given to override the rights of the owner of the submerged lands, namely, the state of New Jersey, and it is, as said, the declaration by the guardian of the interests of the public at large that the proposed work will not interfere with navigation, and is strictly permissive, and not an authorization by paramount authority to do the work proposed. * * *

It is perfectly apparent that nowhere in the tenth section of the Rivers and Harbors Act of 1899 *is there any intention, expressed or implied, to grant to any person or corporation the right to lay a pipe line under navigable waters in lands belonging to a*

state or individual for the purpose of transporting any merchantable commodity whatever. The only intention discovered is, as already said, the authorization of such a work if it may be lawfully done, and the intention is to authorize it to be done only in such a way as to prevent its being any obstruction to navigation. * * *

In this connection, it may be observed that the tenth section of the Rivers and Harbors Act does not provide that it shall be lawful for the Secretary of War to authorize the excavation of land in the channel of any navigable waters of the United States, but only that it shall not be lawful to do the work without the authorization of the Secretary, before beginning the work. *The section as worded clearly contemplates that the consent of the Secretary shall merely be permissive of the doing of work for which authority already exists.*

In view of the context, the word 'affirmatively' was legitimately used to distinguish the two kinds of authority referred to, and to make it plain that the initial authorization to create an obstruction was not to rest on implied, but express—affirmative—congressional authority. * * *

Among the changes effected by the Act of 1899 was to require the affirmative authorization of Congress to create any obstruction to the navigable waters of the United States, except that bridges, dams, dikes, and causeways in or across the navigable portions of which lie wholly within the limits of a single state was permitted if authorized by state legislation and the location and plans of such structure were approved by the Chief of Engineers and of the Secretary of War." * * *

The provisions of the Rivers and Harbors Act of Sept. 19, 1890 (26 Stats. at L. 426), were before this Supreme Court for construction in the case of *U. S.* v. *Rio Grande Dam & I. Co.* (174 U. S. 706), wherein it was said:

"Whatever may be said in reference to obstructions existing at the time of the passage of the act, under the authority of state statutes, it is obvious that Congress meant that thereafter no state should

interfere with the navigability of a stream without the condition of national assent. It did not, of course, disturb any of the provisions of prior statutes in respect to the mere appropriation of water of non-navigable streams in disregard of the old common-law rule of continuous flow, and its only purpose, as is obvious, was to affirm that as to navigable waters nothing should be done to obstruct their navigability without the assent of the national government. * * *

The language is general, and must be given full scope. *It is not a prohibition of any obstruction to the navigation, but any obstruction* to the navigable capacity, and anything wherever done or however done, within the limits of the jurisdiction of the United States which tends to destroy the navigable capacity of one of the navigable waters of the United States, is within the terms of the prohibition. *Evidently Congress, perceiving that the time had come when the growing interests of commerce required that the navigable waters of the United States should be subjected to the direct control of the national government, and that nothing should be done by any state tending to destroy that navigability without the explicit assent of the national government, enacted the statute in question.*"

V.

CONGRESSIONAL AUTHORITY FOR ABSTRACTION OF WATERS OF LAKE MICHIGAN MUST BE BASED SOLELY UPON COMMERCIAL IMPROVEMENT OF THE WATERS OF LAKE MICHIGAN OR IMPROVEMENT OF COMMERCE.

Report of a special board of engineers, which is signed by General W. H. Bixby, chief of engineers, U. S. Army, dated January 23, 1911, pages 8-9, says:

"For purposes of navigation, a diversion from Lake Michigan of less than 1,000 second feet of water is all that will be necessary. For purposes of sanitation the works of the Sanitary District of Chicago were designed to allow the diversion of 10,000

second feet and now contemplate a total of 14,000 second feet, the additional 4,000 second feet to be obtained by a diversion of water through the Calumet River and a connecting canal following the Sag route. The War Department, while awaiting the definite action of Congress, has so far permitted the diversion of 4,167 second feet, and the Sanitary District is understood to be using 7,000 second feet. As the water which is at present being diverted from the lake appears to have already seriously affected the navigation of its harbors and connecting waterways, prompt congressional action is recommended to limit the diversion." (Rec., Vol. 6, p. 3633-3634.)

The report referred to in the above is included in the record, in Volumn 4, pages 2397-D and 2397-E, but the references in the report to the foregoing quotation is not included in the transcript of the record.

"The right of the United States in the navigable waters within the several States is limited to the control thereof for the purposes of navigation. Subject to that right Washington became upon its organization as a State the owners of the navigable waters within its boundaries."

Port of Seattle v. *Oregon & Washington Ry. Co.*, 255 U. S. 56.

The right in and to the navigable waters belonging to the states surrendered by the states to the general government was that right given to the general government under the provisions of Subsection 3 of Section 8, Article 1, of the Constitution of the United States, under the terms of which:

"the Congress shall have power * * * to regulate commerce with foreign nations and among the several states."

"The jurisdiction of the general government over interstate commerce and its natural highways, vest in that government the right to take all needed measures to *preserve the navigability of the navigable water courses of the country, even against any*

state action, and nothing should be done by any state tending to destroy such navigability without explicit assent of the National Government."

United States v. *Rio Grande Dam & I. Co.,* 174 U. S. 690.

In regard to these waters, as highways upon which the commerce of the states and nations move, Congress is given a power to control their use in the interest of that commerce. This authority is given to Congress for the purpose of aiding, and not destroying, navigation and commerce, so that, although the authority over navigable waters is absolute in execution of the trust imposed in it, whatever obstructions Congress authorizes must be for the purpose of improving the navigation of the streams, or of facilitating commerce.

Farnham on Waters, Vol. 1, page 60.

See,

Depew & Wabash and E. Canal, 5 Ind., p. 8.

If the federal government was undertaking the construction of a canal connecting the Great Lakes with the Illinois River, the government would have to base its authority for such action upon the exercise of its power to regulate commerce. The Government could not undertake the work of providing a water course for washing away sewage of a municipal corporation of the State of Illinois.

Obviously, that which Congress itself could not do, the Secretary of War could not do under any claimed congressional authorization or assumed delegation of congressional power.

The states, therefore, respectfully submit, that, in view of the fact that the abstraction of any of the waters of the Great Lakes would tend to affect and obstruct the navigation thereon, no more waters thereof should, or could, be used by the Government than was necessary in the general improvement of commerce, and that the

use of the Sanitary District of these waters, in excess of the amount of waters necessary to provide a commercial highway; which clearly seems to be an amount of less than 1,000 cubic second feet, must be considered as an obstruction of navigation and a hindrance to commerce.

All of which is respectfully submitted.

Supreme Court of the United States

OCTOBER TERM, A. D. 1924.

No. 29839.

THE SANITARY DISTRICT OF CHICAGO,
Appellant,
vs.
THE UNITED STATES OF AMERICA,
Appellee.

BRIEF OF THE CITY OF CHICAGO, APPEARING AS AMICUS CURIAE.

MAY IT PLEASE THE COURT:

This case has pursued its way through many years of litigation without taking into account the interests of the City of Chicago as a municipality. The people of the city, along with the people of the numerous other towns, villages and cities of the Sanitary District of Chicago, have had their interests presented by the attorneys for the District. But as a municipal corporation the City of Chicago has not even had the benefit of sharing representation with the many other municipal and quasi-municipal corporations whose property interests are affected by this litigation.

When it is considered that there are a large number of these corporations, so large a number in fact that the list of villages, towns and cities on pages 4 and 5 of the Petition of the City of Chicago contains only a portion of them, it becomes apparent at once that even if an

attempt had been made to present the property interests of these municipalities, the very important interests of the City of Chicago could not have been adequately handled merely as a unit in a list of municipalities aggregating considerably more than fifty and perhaps numbering one hundred. The property interests of all of these outside of the City of Chicago are comparatively small, and arguments could be used against them which would not apply in the case of the large city. To be sure, the necessity for pure water exists in the small community as well as in the large community, and the principle involved in being deprived of a hearing is the same in both cases, but otherwise the matter presents itself in an entirely different aspect when a city of great size seeks to adjust itself to conditions which may be readily overcome by a corporation of small size. Since neither the City of Chicago nor any of these other corporations have had a hearing, however, it is idle to discuss what kind of presentation should have been made for this city as distinguished from the others.

The City of Chicago had a waterworks system and an enormous investment of capital therein long before The Sanitary District of Chicago was created. The creation of this District did not take this plant away from the City. It retained this property and made such immense additions thereto that the enormous investment we speak of becomes small by comparison. All these investments, the original investment and the additions, have been put into a water plant built so that the whole system adapts itself to the conditions that exist which The Sanitary District is striving to maintain in this suit. The plant belongs to the City of Chicago in its corporate capacity. At least half of this tremendous plant would be rendered useless or nearly so if the decree entered in the court below were to stand, while the corporation which owns it

has not had its day in court. This would amount to a deprivation of property without due process of law on a scale that is staggering.

To anyone who is not familiar with the situation, the holding of this property and its management by one municipal corporation and the control and responsibility for the supply of water to the plant by another municipal corporation seems an anomalous condition. It has been explained to a certain extent, but not entirely, in the briefs presented in this case. We will attempt a further elucidation, confining ourselves to those points which we think have not been fully explained.

Like all rapidly growing communities, the City of Chicago, from the time of its incorporation, was confronted by a debt limitation. Likewise, as is the case with most growing communities, it was confronted with the danger of pollution of its water supply.

The debt limitation fixed by the Constitution of the State of Illinois was five per cent of the total value of the property of the City as ascertained for purposes of taxation at the last preceding assessment. Section 12 of Article IX of the said Constitution reads as follows:

> "Section 12. No county, city, township, school district, or other municipal corporation, shall be allowed to become indebted in any manner or for any purpose, to an amount, including existing indebtedness, in the aggregate exceeding five per centum on the value of the taxable property therein, to be ascertained by the last assessment for State and county taxes, previous to the incurring of such indebtedness. Any county, city, school district, or other municipal corporation incurring any indebtedness as aforesaid, shall before, or at the time of doing so, provide for the collection of a direct annual tax sufficient to pay the interest on such debt as it falls due, and also to pay and discharge the principal thereof within twenty years from the time of contracting the same. This section shall not be

construed to prevent any county, city, township, school district, or other municipal corporation, from issuing their bonds in compliance with any vote of the people which may have been had prior to the adoption of this Constitution in pursuance of any law providing therefor."

When it became certain that the supply of water was contaminated and would ultimately be so polluted that the danger to health would be great, the City undertook to find means to overcome this. The manner in which the danger was avoided by the construction of the canal was fully described in the record and is told in the brief of appellant. But there is one reason for the creation of The Sanitary District of Chicago that has been very lightly touched upon. That is the fact that the City of Chicago was prevented by its debt limitation from itself undertaking the construction of a sanitary canal, and that its people had to resort to the subterfuge of creating a new municipal corporation superimposed on its territory in order to get around this limitation. It was the only way in which it was possible to finance an improvement which would obviously cost a great deal of money, and which in fact has cost a sum approaching a hundred million dollars.

This was one of the principal reasons why The Sanitary District of Chicago was created. The function of digging supply tunnels, building intakes and pumping and supplying water was not turned over to the Sanitary District. It performed and is now performing the function of purifying the water supply. All the rest of the work of supplying water to the City, to its inhabitants, to other municipalities within the district, and to their inhabitants, continues to be the function of the City of Chicago, which has many other functions to perform, requiring revenue.

Necessarily the plant comprising the water system of so great a city would have been costly under any circumstances. But it was rendered more costly by reason of certain provisions of the Sanitary District Act which imposed additional obligations and expense on the City of Chicago.

Section 26 of this Act reads as follows:

"Section 26. Whenever in any such sanitary district there shall be a city, incorporated town or village which owns a system of water-works and supplies water from a lake or other source which will be saved and preserved from sewage pollution by the construction of the main channel, drain, ditch or outlet herein provided for, and the turning of the sewage of such city and district therein, and there shall be in such sanitary district any territory bordering on any such city, incorporated town or village, within the limits of another city, incorporated town or village, which does not own any system of water-works at the time of the creation of such sanitary district, then upon application by the corporate authorities of such latter named city, incorporated town or village, the corporate authorities of such city, incorporated town or village, having such system of water-works shall furnish water at the boundary line between such municipalities by means of its water works to the corporate authorities asking for the same in such quantities as may be required to supply consumers within said territory, at no greater price or charge than it charges and collects of consumers within its limits for water furnished through meters in like large quantities:

Provided, however, that where any such latter named city, incorporated town or village has no territory bordering upon such city, incorporated town or village so owning a system of water-works and supplying water as aforesaid, such latter named city, incorporated town or village may receive water in the same manner and under the same conditions as though it had territory bordering upon such municipality owning a system of water-works and supplying water as aforesaid; *provided,* such latter named

city, incorporated town or village builds or causes to be built suitable and sufficient water mains to the limits of such city, incorporated town or village so owning a system of water-works and supplying water as aforesaid to connect with the water mains and receive the water from such city, incorporated town or village so owning a system of water-works and supplying water as aforesaid."

The above provision requires the City of Chicago to serve, in addition to its own population of 3,000,000, communities surrounding it having a population of 300,000. This would entail in the first instance a plant enlarged ten percent above the needs of the City, but obviously of much greater capacity, since the tendency towards a proportionately larger population beyond its borders grows greater as its business area expands.

Consequently, the City of Chicago has on its hands a costly plant, immensely valuable at present, a large part of which would be rendered useless if deprived of an unpolluted supply of water, and the balance serviceable only in cast it constructs an enormously expensive filtration plant. In addition to this it would have constructed a portion of a plant of no value whatever because it was constructed for outside communities that would have to be cut off and compelled to find their own pure water supply. The alternative to this latter proposition is the building of a filtration plant designed to furnish pure water beyond its borders as well as to its own inhabitants.

With such tremendous interests at stake, can it be said that the City of Chicago has had its day in court? Much has been said about the great cost of the sanitary and ship canal of the appellant, and it is shown that its cost was somewhere near $100,000,000, and that the loss to the people of Chicago and the surrounding communities would be enormous.

Nothing has been said about the cost of the water distributing plant of the City of Chicago, however, which may easily have cost two or three times as much, and the total loss to the people of this district may run into figures comparable to those for financing a great war.

Adding together the cost of the canal, the cost of the City's water system, the cost of the water systems of other municipalities in the district, and estimating the total loss, there is no doubt that the Court has not been fully advised regarding these tremendous property interests. Nor can it fully understand the insignificance, as compared to such interests, of other interests that conflict therewith from the standpoint of navigability of waters. There is no method by which the court can arrive at a just comprehension of the situation in the present state of the record.

It is true, of course, that the necessity for pure water is the paramount need of the people of Chicago and deserves the first consideration. If there was opposed to this the possibility of contamination of water supplies of other communities and danger to the health of people in other places, there might be some reason for saying that the interests of the people of the City of Chicago cannot be so taken care of that other interests must suffer. But that is not the case.

The use of this water by the City of Chicago and surrounding territory does not operate to deprive other communities of pure water or to endanger the health of people elsewhere. It is not pretended that the suit has anything to do with the preservation of health in other districts and communities besides those in or near The Sanitary District of Chicago. The only things that are solicitously to be looked after are the navigation interests of cities and towns located on the great lakes.

When a comparison is made between the property interests of the City of Chicago that are placed in jeopardy by the decree in this case and the interests of the lake towns and cities that would theoretically be damaged in the lessened navigability of their harbors, the balance of convenience is so largely on the side of Chicago that the comparison becomes ludicrous. It is like a pop gun beside a cannon.

We are not disposed to concede that it has been established by the evidence that the lake level would be lowered by the withdrawal of 10,000 cubic feet of water per second. We believe that it would take twenty years of careful measurement and sounding to make any thing like a safe estimate or prediction on this point. The water rises and falls over a period of years under no known or fixed rule. It may vary one way or another and seemingly confirm conclusions drawn from observations made for three or four years, and then without apparent cause (or at least without cause that can be ascertained immediately) shift the other way.

Under these conditions it becomes more especially and peculiarly within the province of the court to take into consideration the balance of convenience of which we speak. The City of Chicago could afford to make good many times over the loss sustained by any and all Federal, State and municipal agencies that have to do with navigation on the Great Lakes (if any) and still be very much better off with the right to withdraw 10,000 cubic seconds feet of water, Add to this the fact that no such loss or damage has been established, and it at once becomes plain that there is the greatest danger of doing injustice beyond measure to one municipality and its people where no real or substantial good can be accomplished for any other.

Turning now to the possibility of helping itself out of its unhappy predicament if the flow of water should be reduced as proposed, what chance has the present generation for a pure water supply? It is not to be conceived that this court would sanction any program or enter any decree which would result in the possible raising of the typhoid rate to even the lowest that obtained prior to the opening of the canal. That was 27 deaths per year for each 100,000 inhabitants. It is now one for each 100,000 inhabitants. Therefore, such an increase among 3,300,000 people would amount to 858 additional deaths per year.

It might be said that this sort of figuring is merely conjectural—that the means of fighting typhoid have improved, and that there is no danger of such a result. Be that as it may, the fact remains that there will be an increased death rate under such conditions. The rich will find means of circumventing it by the purchase of spring water (although even that is often impossible and subject to fraud on the part of the purveyor), but the poor will drink the contaminated water and suffer for it.

The only possible solution at present is a filtration plant. Large areas of land would have to be cleared near the shores of Lake Michigan, great reservoirs would have to be constructed, and other things would have to be done, involving an outlay of approximately $100,000,000. The present generation would have neither the means to finance nor the time to build such a plant.

The land would have to be secured either by converting the City's beautiful lake front parks into reservoirs for purposes of purification, or land of great value would have to be condemned to secure the necessary area.

There is no other way of supplying the needs of the people of Chicago and the surrounding territory except

from the waters of Lake Michigan. The water at the present time is supplied for drinking purposes and for domestic purposes from the same pipes as carry water for manufacturing plants and other uses. There never was any occasion for dividing the supply. The division could not be made now. Hence, the filtration of all the water pumped, amounting to over 800,000,000 gallons per day, would be necessary.

The financing of such a filtration plant by any of the ordinary methods which a municipality can legitimately employ is out of the question. We have already shown that it was necessary to create a new municipal corporation in order to make possible the construction of the canal. It would be necessary to create another municipal corporation to raise such an amount of money as would be required for a filtration plant. The mere statement of such an idea is sufficient to provoke a smile. It took thirty years of agitation to create The Sanitary District of Chicago. It would take longer to create another municipal corporation for the sole purpose of building a filtration plant.

The ordinary methods for financing such an improvement are either by issuing bonds or by direct taxation. To this may be added, in this case, the collection of water rates.

The impossibility of floating bonds for this purpose is manifest when the constitutional limitation already quoted is taken into account. As was stated in the Petition of the City of Chicago, heretofore filed herein, the debt limitation under the Constitution is now $89,433,-268.95. There have already been authorized bonds to such an extent that, with other indebtedness that must be figured, the total debt would be $89,891,700 if all authorized bonds were issued. That is the comptroller's estimate as of November 20, 1924.

All water certificates and bonds or certificates for a filtration plant would have to be included in the limitation. (See *Stone* v. *City of Chicago*, 207 Ill. 492; *Lobdell* v. *City of Chicago*, 227 Ill. 218.) Hence, if all other improvements were allowed to remain at a stand-still and no new public improvements were undertaken, the possibility of issuing the necessary bonds would be so remote as to be unthinkable.

It might occur to someone to say in reply to this argument that the debt limitation of five per cent in the Constitution is not such a thing as need stand in the way of the people of a great state forever—that if it was a matter of life and death for three millions of its people a change could be made in this provision of the Constitution. In truth, however, the obstacle is insuperable. It is extremely difficult to amend the Constitution of Illinois when there is no objection to the proposed amendment. When there is opposition of a substantial nature it is impossible. The provision for amendment (Art. XIV, Sec. 2) is as follows:

> "Section 2. Amendments to this Constitution may be proposed in either House of the General Assembly, and if the same shall be voted for by two-thirds of all the members elected to each of the two Houses, such proposed amendments, together with the yeas and nays of each House thereon, shall be entered in full on their respective journals; and said amendments shall be submitted to the electors of this State for adoption or rejection, at the next election of members of the General Assembly, in such manner as may be prescribed by law. The proposed amendments shall be published in full at least three months preceding the election, and if a majority of the electors voting at said election shall vote for the proposed amendments, they shall become a part of this Constitution. But the General Assembly shall have no power to propose amendments to more than one article of this Constitution at the same session, nor to the same article oftener than once in four years."

Even so salutory an amendment as the one just voted upon, whereby the number of amendments that could be proposed at one time was raised to two, which was known as the "Gateway Amendment," and against which there appeared no pronounced opposition, seems to be defeated. The same thing happened to the revenue amendment offered several years ago, which was the last preceding amendment and was apparently acceptable as a means for making needed revenue changes. When it is considered that there would be pronounced opposition to any amendment of the Constitution which would call for largely increased taxation, or which affects The Sanitary District of Chicago in any way, whether adversely to the interests of the people "down-state" or not, the utter hopelessness of turning to this supposed means of relief is manifest.

Hence, there is no chance whatever of raising the necessary revenue either by means of a bond issue or by any subterfuge for evading the established debt limitation.

So far as raising the necessary money for an improvement of such magnitude by direct taxation is concerned, that is also out of the question. A comparison between the rates of taxation, whether taken on a *per capita* basis or on a property basis, or by any other means, would show the rate of taxation in Chicago for local purposes at least up to the average. The Department of Commerce issues statistics of the Bureau of the Census which clearly demonstrate this, although it is extremely difficult to make a comparison which is even approximately correct. (See Table 14, pp. 266 to 307, Financial Statistics of Cities Having a Population of Over 30,000; Published by Department of Commerce in 1924.)

Since it must be conceded that there is necessity for local expenses which will take up such average tax rate,

there is no occasion for reciting at length the financial worries of the City of Chicago as a municipality. It has these to quite as full an extent as other municipalities. They would effectually prevent the diversion of any considerable sum out of the annual revenues from the fund for general corporate purposes to the water fund.

Finally there remains the possibility of raising water rates sufficiently to finance such an improvement as the installation of a filtration plant. While this may be conceded to be the most promising of the methods suggested, it has its limitations. The appropriations for the current year for the Bureau of Water are less than $15,000,000. (See Journal of the Proceedings of the City Council of the City of Chicago, March 28, 1924, page 2365.) The income from water rates at present is far below this, the system showing a loss of considerable size from year to year.

To raise water rates sufficiently to take care of present deficiencies and at the same time build a filtration plant would mean such an increase as would at least double the rates—perhaps treble them. The taking on of such a burden would be equivalent to an increase in the taxation, and in any event it would amount to a great loss to the owners of property in the City.

Another feature of the situation with respect to the installation of a filtration plant must not be lost sight of. That is the time it would take to prepare and to build such a plant. This has been estimated as twenty years. It may be conceded that this subject is more or less problematical, but that a large amount of time would be necessary is certain.

Water now comes through tunnels extending underneath the lake for distances of from two to four miles. Whether these would be rendered useless or whether they can be

so converted that they will form parts of the proposed filtration plant belongs to those engineering problems which we are not called upon to go into. But whatever is done with them, the cost manifestly would be great, and the time necessary to convert them would be a matter of many years. On the other hand, if the court should decide to affirm the decree, it would depend entirely on the indulgence of the court whether it would go into effect immediately or not.

In this connection it might be well to consider that the entry and the enforcement of the decree in the court below have been put off for a number of years, and the danger of which complaint is made in the bill does not seem to have become greater or more imminent.

In presenting the view of the situation which this brief sets forth we have to some slight extent traveled beyond the record, although we have, in such matters as do not appear in the record, endeavored to confine ourselves to things that are matters of common knowledge.

The principal contention that we make, having in mind that arguments on both the sanitary and ship canal features of the controversy have been presented by others, is that the decree, if affirmed, would be the means of wiping out large property values of the City of Chicago, that this would be done without a hearing and without taking testimony concerning the comparative value of the property rights affected. We are late in presenting this phase of the controversy, but on the whole we believe it is better to present it now and in this case than to wait until this case is ended and then attempt to set up our rights in an independent proceeding.

While we have stressed the property interests of the City of Chicago in this brief, lest it be understood as

trying to give greater prominence to these than to the health and sanitary features of the case, we repeat that the question of the health of the people is of much greater importance than anything else in the case. To turn back the foul waters which the people of this district have been at such pains to divert would create havoc in the community. It would mean the destruction of a record of constant improvement in the matter of public health that has been unbroken for 30 years. It would turn back the wheels of progress and open the floodgates of disease upon an unprotected public. The consequences would be appalling if a single typhoid epidemic were to result, and with the sewage returning to the lake it would be impossible to avoid that.

We join with the appellant in praying for a reversal of the decree, in order that when the case is reopened the City of Chicago may have an opportunity to intervene and present the phase of the case we have outlined above.

Respectfully submitted,

Francis X Busch

Appellant,

vs.

UNITED STATES OF AMERICA,
Appellee.

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES, NORTHERN DISTRICT OF ILLINOIS, EASTERN DIVISION.

PETITION FOR REHEARING ON BEHALF OF AMICI CURIAE ALLOWED BY ORDER OF COURT TO APPEAR AND OPPOSE THE AFFIRMANCE BY THIS COURT OF THE DECREE BELOW.

Now come the states of Illinois, Missouri, Louisiana, and Tennessee and the Chamber of Commerce of St. Louis, Memphis Chamber of Commerce, New Orleans Board of Trade, New Orleans Association of Commerce, Mississippi Valley Association, and the Chicago Association, as *amici curiae* appearing by leave of court first had and obtained, and respectfully petition this Honorable Court to vacate the order of affirmance en-

tered herein on the 5th day of January, A. D. 1925, and to grant a rehearing in the above entitled cause.

In support of this petition for rehearing the above mentioned *amici curiae* submit suggestions hereto attached and made a part hereof.

EDWARD J. BRUNDAGE,
Attorney General of Illinois.

JESSE W. BARRETT,
Attorney General of Missouri.

J. FRANK THOMPSON,
Attorney General of Tennessee.

IN THE

Supreme Court of the United States.

OCTOBER TERM, A. D. 1925.

THE SANITARY DISTRICT OF CHICAGO,
Appellant,

vs.

UNITED STATES OF AMERICA,
Appellee.

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES, NORTHERN DISTRICT OF ILLINOIS, EASTERN DIVISION.

SUGGESTIONS IN SUPPORT OF THE FOREGOING PETITION FOR REHEARING.

In order that we may present the points relied upon to justify this application as concisely as possible, we must first outline briefly the opinion of the court.

The opinion begins by describing the bill. It states that obstructions to navigation in violation of Section 10 of the Act of March 3, 1899, are specifically pleaded, but says:

> "The form of the bill does not preclude a reliance upon more general principles if they were needed in order to maintain it."

The works of the appellant were then described, and the answer is summarized.

The discussion of the law begins by resting the jurisdiction upon the sovereign power of the United States

to regulate commerce and control navigable waters. It is stated that the Attorney General, by virtue of his office, might bring this proceeding without statutory authority.

The court then lays down the rule that the power of the United States is superior to that of the states, and in matters where the national importance is imminent and direct, even when Congress has been silent, the states must not act at all.

The court then takes up the defense urged by appellant that the United States had given its assent to appellant's acts, and construes the Act of March 2, 1827, so much referred to in the argument. The court then quotes the material portions of Section 10 of the Act of March 3, 1899, and states:

> "This statute repeatedly has been held to be constitutional in respect of the power given to the Secretary of War. *Louisville Bridge Co.* v. *U. S.*, 242 U. S., 409, 424; 61 L. ed. 395, 403; 37 Sup. Ct. Rep. 158."

The court says this statute is a broad expression of public policy forbidding obstructions to navigable capacity, "not authorized by law," referring we assume, in the last phrase, to the power given the Secretary of War to issue permits for such alterations of navigable capacity.

The court says:

> "There is neither reason nor opportunity for a construction that would not cover the present case."

The court concludes its analysis of the question with the following expression:

> "This withdrawal is prohibited by Congress, except so far as it may be authorized by the Secretary of War."

The court then enters into a detailed discussion of

the several permits issued, and finds that no defense can be founded upon these permits. Referring to these *amici curiae*, the court says:

> "States bordering on the Mississippi allowed to file briefs as *amici curiae*, suggest that they were not heard, and that rights have not been represented before the Secretary of War. * * * The interest that the river states have in increasing the artificial flow from Lake Michigan is not a right, but merely a consideration that they may address to Congress, if they see fit, to induce a modification of the law that now forbids that increase unless approved as prescribed. * * * It is doubtful, at least, whether the Secretary was authorized to consider the remote interests of the Mississippi states or the sanitary needs of Chicago. All interests seem in fact to have been copiously represented, but he certainly was not bound to give them a hearing on the application upon which he was requested to pass."

The court then reviews the history of the litigation and the delay in reaching a decision, and concludes by affirming the injunction below.

I.

IN HOLDING THAT THE STATES DO NOT HAVE AUTHORITY TO AUTHORIZE DIVERSIONS FROM NAVIGABLE WATERS IN THE ABSENCE OF CONGRESSIONAL ACTION, IN THE FIRST PLACE, NO SUCH ISSUE IS TENDERED BY THE BILL OF COMPLAINT, AND IN THE SECOND PLACE, THE CONCLUSION OF THE COURT, OBITER WE SUBMIT, IS CONTRARY TO A LONG LINE OF PRIOR DECISIONS BY THIS COURT.

(a) We assume that this court applies the fundamental rule of equity that relief is limited to the allegations of the bill and does not go beyond the scope of the prayer. The bill of complaint in this case is founded solely upon the allegation that appellant failed to ob-

tain a permit in accordance with the requirements of Section 10 of the Act of March 3, 1899, authorizing diversions in excess of 250,000 c. f. a minute. The prayer of the bill (Vol. 8, Trans. of Rec., 44) prays for an injunction enjoining appellant from diverting waters in excess of 250,000 c. f. per minute as already authorized by the Secretary of War, and this was the injunction issued by the court below.

A fair consideration of the bill will demonstrate that there are no allegations alleging that the Attorney General is proceeding for the purpose of enforcing the sovereign power of the United States in a matter over which, even in the absence of Congressional action, the states can have no jurisdiction, by reason of any alleged exclusive effect of the Commerce Clause of the Constitution. The language of the opinion, therefore, in reference to this is clearly a misconstruction of the record. The case of the Government must stand or fall upon the validity and effect of Section 10 of the Act of March 3, 1899.

(b) Without referring to the authorities, this court has construed the Commerce Clause of the Constitution in many matters in such a way as to leave to the state concurrent jurisdiction over much of the realm of interstate commerce, which jurisdiction may be lawfully exercised until Congress has taken possession of the field by apt legislation.

This court has said as to a few matters, that they are such as to be within the exclusive jurisdiction of Congress because by their nature they require a uniform system or plan of regulation.

The opinion in this case does not claim any such basis for its conclusion that diversions from navigable streams require only one plan of regulation applicable to all

parts of the United States, and to all attempted diversions of water, whether for purposes of aiding mining, irrigation, reclamation projects, drainage of swamps, or as in the instant case, the improvement of waterways, and the incidental facilitation of sanitary projects. It is clear that in the nature of the subject matter, one uniform system of regulation would not operate for the public benefit.

In the *Rio Grande Dam Case,* 174 U. S. 690, this court dealt with diversions from navigable waters on the theory that these were within the concurrent jurisdiction of the states.

The following cases reflect this view: *County of Mobile* v. *Kimball,* 102 U. S. 691; *Lindsay* v. *Phillips,* 176 U. S. 126; also: *U. S.* v. *Crest,* 243 U. S. 316, and the *Bellingham Bay Boom Case,* 176 U. S. 223. Perhaps the leading authority on this subject is the case of *Cooley* v. *Board of Wardens,* 12 Howard, 289.

We respectfully submit that this court has, therefore, laid down a rule inconsistent with a long line of prior decisions.

II.

IN CONCLUDING AS THE COURT DOES THAT SECTION 10 OF THE ACT OF MARCH 3, 1899, IS CONSTITUTIONAL, THE COURT CITES AN AUTHORITY WHICH DOES NOT SUSTAIN ITS CONCLUSION IN ANY WAY WHATSOEVER, AND OVERLOOKS THE FACT THAT ON SETTLED PRINCIPLES OF CONSTITUTIONAL LAW WHICH ARE NOT CONSIDERED BY THE COURT IN ANY DECREE WHATSOEVER IN THIS DECISION, THE POWERS EXERCISED BY THE SECRETARY OF WAR IN THE INSTANT CASE ARE UNCONSTITUTIONALLY DELEGATED, IF THIS SECTION BE CONSTRUED TO CONFER SUCH AUTHORITY.

The court says in the opinion:

> "This statute has repeatedly been held to be constitutional in respect of the power given to the Secretary of War. *Louisville Bridge Co.* v. *United States,* 242 U. S. 409, 424; 61 L. ed. 395, 403; 37 Sup. Ct. Rep. 158."

Immediately prior to this sentence the court quotes the applicable portions of Section 10 of the Act of March 3, 1899. The *Louisville Bridge case,* cited to support this conclusion, does not concern itself in any degree whatsoever with Section 10, but did involve the exercise by the Secretary of War of the power conferred upon him by Section 18 of the Act of March 3, 1899, to regulate bridges, which unreasonably obstruct navigation. There is no other case which we have been able to find which squarely holds that the power conferred by Section 10 of the Act of 1899 is a constitutional grant of authority, and none is cited in the opinion except the erroneous citation just pointed out.

In a number of cases the court has had occasion to construe and pass upon the authority of the Secretary

of War under Section 18 of the Act of 1899, particularly *Union Bridge Co.* v. *United States,* 204 U. S. 364, and *Monongahela Bridge Co.* v. *United States,* 216 U. S. 177. The court summarizes the state of the law in the latter decision, particularly as to the extent to which Congress could delegate its authority to the Secretary of War, and the manner in which such delegation must be constitutionally exercised, in the following expressions:

> "This Court has heretofore held, upon consideration and after an examination of the adjudged cases:
>
> (1) That 18th Section of the river and harbor Act of March 3, 1899, 30 Statutes 1151, could not reasonably be taken as a delegation of legislative and judicial power to an executive department of the government; that the statute did not in any real, constitutional sense delegate to the Secretary of War any power that must, under our system of government, be exclusively exercised either by the legislative or judicial branch of the government; that under its paramount power to regulate commerce on and over the navigable waters of the United States, Congress could require that such waters be free from unreasonable obstructions to navigation; that the statute in effect prescribed the general rule, applicable to all navigable waters, that free navigation should not be hampered by unreasonable obstructions arising from bridges of insufficient height, width of span or other defects; that instead of exerting its power by direct legislation in each case of a bridge alleged to constitute an unreasonable obstruction to navigation, Congress charged the Secretary of War with the duty of ascertaining, in each case, upon notice to the parties concerned, whether the particular bridge came within the general rule prescribed; * * *
>
> (2) That the Act of 1899 did not invest the Secretary of War with arbitrary power in the premises, since in reference to any bridge alleged to constitute an unreasonable obstruction to navigation, he was bound, before making any decision or tak-

> ing final action, to notify the parties interested of any proposed investigation by him, give them an opportunity to be heard, and allow a reasonable time to make such alterations as he found to be necessary to free navigation."

SECTION 10 in its construction and effect is entirely different. It lays down a broad prohibition of any obstruction of the navigable capacity of any waters of the United States, "not affirmatively authorized by Congress." And then provides that it shall not be lawful to do certain varieties of obstructions, nor to alter the capacity of any navigable water, "unless the work has been recommended by the Chief of Engineers and authorized by the Secretary of War prior to beginning the same."

Each of the acts mentioned in the concluding portion of the section which may be so authorized by the Secretary of War and Chief of Engineers, would, clearly, without such authorization, fall within the purview of the general prohibition in the first sentence of the statute. There is no test nor rule of any kind whatsoever specified in the statute by which the administrative officers are to be guided in determining whether or not their authority shall be granted. None of the requirements of due process providing for a hearing or notice to interested parties are found in this section. The language just quoted from the prior decisions of the court indicate clearly, we submit, that the exercise of authority conferred by Section 18 was held in these cases to be constitutional, simply and solely because the requirements of due process were, by the language of Section 18, carefully safeguarded and preserved. Based on the reasoning of these decisions Section 10 must be construed to be unconstitutional and void. This point was fully presented to the court in the brief filed

on behalf of *amici curiae,* pages 45 to 57, inclusive. It was only touched upon in the argument, due to the way in which the case was presented. Yet, nevertheless this court must assume that its decision will serve as authority for the granting by Congress of broad, unlimited and practically arbitrary power to administrative officers, a conclusion, not in the public interest, inconsistent with all prior decisions, and, we believe, not intended by the court in this case.

That the writer of the opinion of the court was unconsciously concerned with the requirements of due process as embodied in the exercise of the power conferred upon the Secretary of War by Section 10 of the Act of 1899 is clearly illustrated by the expressions in the opinion concerning the intervention of these *amici curiae.*

The court said:

> "States bordering on the Mississippi, allowed to file briefs as *amici curiae* suggests that they were not heard and that rights have not been represented before the Secretary of War. * * * It is doubtful, at least, whether the Secretary was authorized to consider the remote interests of the Mississippi States or the sanitary needs of Chicago. All interests seem in fact to have been copiously represented, but he certainly was not bound to give them a hearing upon the application upon which he was requested to pass."

In stating that these *amici curiae* were represented before the Secretary of War, the court has fallen into error. There is nothing in the record to support this statement.

As shown in the petition upon which the court granted us leave to appear, the interest of these *amici curiae* is primarily a navigation interest. Therefore, primarily a matter concerning which the Secretary of War is di-

rectly empowered and authorized to act. It is difficult to understand the doubt expressed in the above statement as to the right of the Secretary to consider the interests of the Mississippi states.

We do not believe that a fair consideration of the facts justify calling these interests remote. The water transportation from Chicago to the Gulf of Mexico by way of appellant's canal to the Illinois River and the Mississippi River, affords one continuous water route. The geographical distance of the State of Louisiana for instance, from the port of Chicago, does not, we submit, affect the question. Consideration of a single unit of water transportation was necessarily involved. That these rights and this interest should have been heard and duly considered if any broad, statesmanlike handling of this problem is to be reached, cannot be disputed.

The very fact that the court expressed doubt as to the authority of the Secretary of War to give consideration to these matters demonstrates, we believe, that any proper construction of Section 10 cannot be held to confer the type of authority exercised by the Secretary of War in this case.

Conclusion.

In conclusion we would respectfully urge that the court glance at the index to the printed transcript of the oral argument, filed as an appendix to the petition for rehearing of appellant in this case, which shows the questions asked by the court during the oral argument. In the three hours or 180 minutes of time allotted to counsel for appellant and these *amici curiae*, there were 219 questions asked from the bench. Any fair consideration of this transcript of the oral argument will show,

we submit, that the case could not have been adequately presented in the time allowed. And furthermore it is clear that counsel for the United States made several statements in their argument obviously prejudicial to our side of the question, not supported by the record, to which appellant had no opportunity whatever to reply.

The importance of this case and the broad departure from principles heretofore accepted as settled, alone would justify this petition.

We respectfully urge, therefore, that further opportunity to more fully present the important questions, many of which have obviously not been adequately spread before the court should be allowed.

Respectfully submitted,

K. Modifications of Permit of May 8, 1899..... 42–45

April 9, 1901—Diversion reduced to 200,000 cu. ft. per minute..... 42–43

July 23, 1901—Diversion of 300,000 cu. ft. per minute allowed between 4 p. m. and midnight..... 43

December 5, 1901—Diversion made uniform at 250,000 cu. ft. per minute..... 43–44

December 29, 1902—Application of appellant for an increase to 350,000 cu. ft. per minute during closed season of navigation..... 44

January 17, 1903—Permit of Secretary of War allowing increase to 350,000 cu. ft. per minute until March 31, 1903; after that, 250,000 cu. ft. per minute..... 44–45

L. Amendment of May 14, 1903, by Illinois Legislature, to Enabling Act of May 29, 1889..... 45–46

ARGUMENT ON THE FACTS—Continued.
II. Review of the efforts of appellant to obtain permission from the Federal Government to withdraw water from Lake Michigan—Continued. Page
M. Findings of U. S. Lake Survey and International Waterways Commission with respect to lake levels 47–48
June 13, 1902—Act of Congress providing for International Waterways Commission 47
January 4, 1907—Report of International Waterways Commission 47–48
N. Decision of Secretary of War on Application of appellant to withdraw water through Calumet River 48–51
November 28, 1906—Application of appellant for permit to reverse Calumet River and divert water 48–49
March 14, 1907—Recommendation of Chief of Engineers that application be denied; decision of Secretary of War denying application 49–51
O. Wilmette Permit of September 11, 1907 51
P. Ordinance of appellant asserting its independence of Federal Control, September 18, 1907 52–53
Q. Calumet Permit of June 30, 1910 53–55
R. Application of appellant of February 5, 1912 .. 55
Opposition from various parts of the United States 56
Opposition from representatives of Canada .. 57
S. Decision of Secretary of War on January 8, 1913, denying appellant's application for increased diversion 58–67
February 24, 1913—Communication from War Department to appellant calling attention to unauthorized diversion and threatening action by district attorney .. 64–65
March 22, 1913—Reply from appellant, requesting that its rights be tested by suit for injunction 66–67
III. Evidence as to Quantity of Water now being withdrawn by appellant from Lake Michigan and as to amount it intends to withdraw 67–70
Diversion through Wilmette, Calumet, and Main Channels 68
Average amount withdrawn, 1900–1913 69
Future withdrawal based on estimated population of Chicago 70

ARGUMENT ON THE FACTS—Continued. Page

IV. Effect of withdrawal of water from Lake Michigan upon the levels of the Great Lakes..... 70–94
A. Comparison with other waters..... 70–71
B. Decision of Secretary of War on January 8, 1913, and admission of appellant of correctness of Government's calculations..... 71–73
C. Official Reports as to effect of diversion upon lake levels..... 74–78
1895—Board of Engineers..... 74
1898—Deep Waterways Commission.. 74
1899 et seq.—U. S. Lake Survey..... 74
January 4, 1907—Report of International Waterways Commission..... 74
1907–1908—Further observations on Niagara River..... 75
1909—Further observations on St. Clair River..... 75
January 8, 1910—Report of International Waterways Commission..... 75
Report of Canadian representatives... 76
Statement of principle involved in effect of diversion..... 77–78
December 16, 1913—Report of Board of Engineers..... 78
D. Evidence sustaining the Official Reports..... 78–86
Comparison of conclusions—appellant's and appellee's witnesses..... 79
Comparison of expert qualifications of appellee's witnesses with those of appellant's witnesses..... 80
E. Effect of appellant's diversion is a substantial interference with navigable capacity of Great Lakes..... 87–94
Report of International Waterways Commission of January 8, 1910..... 87
Report of Canadian Representatives.. 88
Report of Chief of Engineers, 1893... 89
Testimony of Shenehon..... 89–90
Contentions of appellant..... 90–94
V. Injury to navigation resulting from lowering of Great Lakes..... 94–106
Findings of Secretary of War, January 8, 1913. 94
Report of International Waterways Commission December 1, 1907..... 94
Report of Board of Engineers, August 15, 1913.. 94–95
Statement of Shipping Federation of Canada... 96
Analysis of evidence as to effect of lowering..... 97–106

ARGUMENT ON THE FACTS—Continued. Page
VI. Evidence as to methods of compensating for loss of Lake level..... 107–113
Offsetting damage by lengthening vessels..... 107
Partially restoring depths by dredging, etc.. 107–109
Regulating or compensating works..... 109–113
VII. Injury to navigation due to current caused by excess flow through Chicago River..... 114–117
VIII. There are no Acts of Congress and no investigations or surveys of United States officers which amount even remotely to an invitation to build this canal, or to authority for its construction..... 117–118
IX. Evidence as to cost of building sewers, purifying works, etc., in case the unauthorized diversion is enjoined..... 118–122
ARGUMENT ON THE LAW..... 123–315
I. Waters here involved are navigable waters of the United States..... 123
A. Definition of navigable waters of the United States..... 123
B. Great Lakes, Chicago River, Calumet River, and Desplaines and Illinois Rivers have been held to be within definition..... 125
C. Great Lakes are international navigable waters. 125
II. Subject of Great Lakes levels is national in character and requires exclusive control in Congress—Sections 20 and 23 of Illinois Enabling Act of 1889 have been void since their enactment..... 128–158
A. Distinction between subjects of interstate commerce local and national in character..... 132–135
B. Prior to 1890, subject of obstructions to navigable capacity of intrastate navigable waters was deemed local in character..... 135–136
1. Dams..... 135
2. Bridges..... 136
3. Improvements..... 136
C. Subject of obstructions to navigable capacity of interstate navigable waters has always been deemed national in character..... 136–150
1. Power of state has been limited to... 137–139
(a) Regulation of pilotage..... 138
(b) Protection of coasts and improvement of harbors..... 138
(c) Quarantine and inspection laws, and policing of harbors..... 138
(d) Regulation of wharfs, piers, and docks..... 138
2. Obstructions to navigable capacity of such waters have always been held unlawful in absence of authority from Congress..... 139–150

ARGUMENT ON THE LAW—Continued. Page

II. Subject of Great Lakes levels is national in character and requires exclusive control in Congress, etc.—Contd.

D. Art. 4 of Ordinance of 1787 forbids Illinois to interfere with or decrease navigable capacity of Great Lakes..... 151–153

E. Subject of Great Lakes Levels is necessarily national because international in character..... 154–158

III. By its Acts of 1890 and 1899, Congress assumed control of the subject of obstructions to the navigable capacity and modifications of the course, condition, and capacity of all navigable waters of the United States..... 159–189

A. Decisions prior to 1890 recognized power of Congress to assume exclusive control..... 163–164

B. Act of 1890 and 1899 are an effective assertion by Congress of its paramount control..... 164–168

C. Effect of Section 10 of Act of 1890 is to make creation of obstructions or modifications dependent upon joint assent of National and State governments..... 168–173

1. Meaning of "affirmatively authorized by law" in Section 10 of Act of 1890..... 169

2. Meaning of "affirmatively authorized by Congress" in Section 10 of Act of 1899..... 169–173

D. Under Section 10 of Act of 1899, Act of Congress is necessary to authorize creation of obstruction; recommendation of Chief of Engineers and authorization of Secretary of War necessary to authorize modification, etc..... 174–181

E. Whether entire navigable capacity should be conserved for use and safety of navigation is a question legislative in character; determination by Congress conclusive..... 181–184

F. Whether a modification amounts to an obstruction is a question upon which determination of Chief of Engineers and Secretary of War has the force of a determination by Congress and is conclusive..... 184–189

IV. Appellant has created and is maintaining obstructions in violation of Section 10 of Act of 1899..... 189–202

A. Definition of "obstruction"..... 192–194

B. Neither material injury and damage to commerce nor "unreasonable" obstruction necessary.. 195–200

C. Appellant's criticism of appellee's use of expert evidence is unfounded..... 201–202

ARGUMENT ON THE LAW—Continued. Page

V. Obstructions created by appellant have never been "affirmatively authorized by Congress" 202–235

A. Act of Congress of 1827, relating to Illinois and Michigan Canal, did not constitute such authorization—history of Illinois and Michigan Canal 203–218

1. Was for construction of a particular canal, location of which was to be determined by law 209–212

2. Was for purpose of navigation, not sanitation 212–214

3. Further diversion prohibited by Acts of Congress of 1890 and 1899 215–217

4. Diversion through Illinois and Michigan Canal affected only intrastate waters 217–218

B. Niagara Falls Act of 1906 did not constitute such authorization, but instead forbade the unauthorized diversion 219–226

1. Its prime purpose was to prevent further depletion of flow at Niagara Falls ... 220–222

2. It was not limited to diversions made somewhere in the State of New York 222–226

C. Canadian Boundary Waters Treaty of Jan. 11, 1910, did not constitute such authorization; instead, it forbade any diversion over 4167 c. s. f. 226–235

VI. Appellant's diverson in excess of 4167 c. s. f. has not been recommended by Chief of Engineers nor authorized by Secretary of War, as required by Section 10 of Act of 1899 236–244

A. Permits for improvements in the Chicago River prior to May 8, 1899 236–238

B. Permit of May 8, 1899 238–241

C. Permits of July 11, 1900 241–242

D. Appellant estopped to question limitation of 4167 c. s. f. 243

E. Secretary of War may impose conditions on permits granted by him under Section 10 of Act of 1899 243–244

VII. Appellant's unauthorized diversion cannot be justified as exercise of the police power reserved to the State 244–255

A. On a subject of interstate commerce national in character, there is no police power reserved in the State to invade the exclusive control of Congress 247–249

B. On all other subjects of interstate commerce, when Congress has asserted its paramount control, there is no police power in the State to invade the exclusive control of Congress 249–255

ARGUMENT ON THE LAW—Continued. Page

VIII. Right of appellee to an injunction is not barred by laches, acquiescence or estoppel..... 255–283
A. Laches..... 263–266
B. Acquiescence..... 267–270
C. Estoppel..... 270–283
IX. Appellee is entitled to an injunction, effective immediately and without condition, restraining appellant from diverting more than 4167 c. s. f..... 283–319
A. Attorney General has authority to institute suit for an injunction in aid of Government's duty to preserve the navigable capacity of navigable waters of the United States..... 284–297
1. Sec. 12 of Act of 1899 is sufficient authority for the instant suit.. 285–290
2. Independently of Sec. 12 there is sufficient authority for the instant suit..... 290–297
B. Doctrine of comparative injury has no application to a suit by the United States to protect its sovereign power over interstate commerce..... 297–302
C. The lower court did not err in denying appellant's motion of July 12, 1920..... 302–310
1. Appellant cannot be upheld by its offer to give appellee something else which may be regarded as of equal value..... 303
2. Power of granting or refusing authorization lies in Congress and, so far as it has been delegated, in Chief of Engineers and Secretary of War 304
3. Construction of compensating works is forbidden by Canadian Boundary Waters Treaty without approval of International Joint Commission..... 304–306
4. Decree proposed by appellant would be void and inoperative in that it would contain a condition which court would be powerless to enforce..... 306–310
D. Decree for an injunction should be effective immediately..... 310–315
CONCLUSION..... 316–321

In the Supreme Court of the United States

OCTOBER TERM, 1924

THE SANITARY DISTRICT OF CHICAGO, appellant *v.* THE UNITED STATES OF AMERICA, appellee	No. 161

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE NORTHERN DISTRICT OF ILLINOIS, EASTERN DIVISION

BRIEF FOR APPELLEE

ARGUMENT ON THE FACTS

(Pages 1—122.)

INTRODUCTORY STATEMENT

This case, which was subjected to the unprecedented delay of over *fifteen* years in the court below, involves the right of the appellant, Sanitary District of Chicago, to divert from Lake Michigan an indefinite and increasingly large amount of water, in defiance of legislation by Congress and of rulings by the Department of War. The appellant has a

17925—24†——1

permit from the War Department to divert 4,167 cubic feet per second (hereinafter abbreviated as "c. s. f."); it is actually diverting at least 10,000 c. s. f.

The Sanitary District of Chicago is a municipal corporation created in 1889 under a statute enacted by the Illinois Legislature in that year. As such corporation it is entirely separate from and independent of the city of Chicago; the area of the district served by appellant includes not only Chicago but suburbs to the north and to the west and southwest. Chicago is, therefore, in the unique position of having its water supply and sewage disposal problem handled by *two* municipal corporations. As the result of appellant's diversion works, the city has profited by an exceptionally cheap water supply in comparison with that of other cities situated on the Great Lakes.

The total area of appellant's district is 437.39 square miles and it had a population in 1922 of 3,142,000. In addition to disposition of the sewage of the population, it has the duty of disposing of industrial wastes which are equivalent to the sewage of an additional population of 1,500,000. It is estimated that by 1960 the population and industrial equivalent of appellant's district will total 8,160,000. (Appellant's Narrative, pp. 361–362.) Appellant's organic act requires it to divert through its canal 20,000 cubic feet of water per minute for each 100,000 of population (333 c. s. f.).

The diversion complained of by appellee is accomplished by turning from the Great Lakes and into

the Mississippi Valley a large navigable river, equivalent in flow to the sum of the three principal tributaries of Lake Michigan. This is done through appellant's canal, referred to in its brief as the "Sanitary and Ship Canal." The canal is about 28 miles long and extends from a tributary of the Chicago River southwest across the divide to just north of Joliet, Illinois, where it empties into the Des Plaines River. The location of this canal, and its relation to the Chicago River, is explained by the map to be found in Appellant's Narrative (opposite page 92). Chicago River proper is very short and flows east into Lake Michigan (it is shown in yellow on the map and enters Lake Michigan at a point just north of the notation "Chicago Harbor" on the lake). It is formed by two branches meeting at about a mile inland (also shown in yellow on the map), and known as the North and South Branches of the Chicago River. About three miles south of the juncture of these two branches the South Branch is formed by two forks, the West Fork and the South Fork.

Appellant's canal connects with the West Fork of the South Branch of the Chicago River. The old Illinois and Michigan Canal connects with the South Fork from which for many years before 1900 the city diverted a small amount of water by means of a pumping station. Appellant's diversion of water from Lake Michigan is distributed as follows:

(1) Through the Main Channel of the Chicago River, 6250 c. s. f.

(2) Through the North Branch of the Chicago River (which is connected with Lake Michigan by a canal north to Wilmette, Illinois, and by a conduit at Lawrence Avenue—both marked yellow on the map), 1750 c. s. f.

(3) Through the 39th Street conduit(which empties into an arm of the South Fork of the South Branch and thence flows into the West Fork), 2,000 c. s. f.

This is a total of 10,000 c. s. f. (See Appellant's Brief, pp. 13–14.)

There is a further diversion of 2,000 c. s. f. by appellant by means of another canal which runs from the Little Calumet River to the appellant's main canal at Sag, Illinois. It is shown in red on the map. The Calumet River, to which the Little Calumet is tributary, enters into Lake Michigan at a point several miles south of the mouth of the Chicago River.

Appellant's main canal has a constructed capacity of 14,000 c. s. f., at least in the rock section. Excavation began in 1893. It was connected with the West Fork of the South Branch on January 17, 1900. The Wilmette Canal was completed in 1910 and the Calumet-Sag Canal in 1922.

By reason of the large diversion of water and its potential power, appellant was able to install a large hydro-electric plant in 1907, just north of Joliet. The power energy is converted into electricity and is sold to the profit of appellant to municipalities, parks, and districts.

The appellant's brief and narrative statement gives a misleading impression of the issues involved on this appeal. It's statements that "there is no question of pleading involved" and that with certain exceptions "there is no dispute as to any facts in the record" (Appellant's Brief, p. 4) are contradicted by the record. So also is the heading "Undisputed Evidence" with which appellant has inaccurately entitled a large portion of its narrative statement (pp. 163–344).

When the decree was entered by the court below, there was pending a motion by the appellee made on the filing of the answers, to strike certain portions of the appellant's answer in the Main Channel Suit. These portions set up the affirmative defenses upon which the appellant then and now places its chief reliance. The so-called "undisputed evidence" consists of evidence, offered and received by the commissioner over the objection of the appellee, in support of these portions of appellant's answer. It was not necessary for appellee to offer evidence in rebuttal on these issues, as it relied upon its motion which was to strike out untenable defenses, which motion was based on the theory that the averments of the answer did not set up any admissible defense. It was understood throughout the entire litigation that if any of these averments should be held to constitute an admissible defense, the appellee should have the right to offer testimony upon the issue thus raised, and the court reserved this right to the appellee.

Judge Landis, in his oral opinion rendered June 19, 1920 (Rec. Vol. VIII, p. 151), held that none of the matters, set up in these portions of appellant's answer, constituted a defense, and said he would enter an order sustaining the appellee's exceptions thereto. Judge Carpenter came to the same conclusions, as will be seen by reference to his opinion filed June 18, 1923. (Rec. Vol. VIII, p. 127.) While no order striking this portion of the answer was ever actually entered, the final decree was understood by both parties as necessarily accomplishing the same result. Consequently, if this Court should be of the opinion that these portions of the answer *do* allege a sufficient defense, the appellee will be entitled to an opportunity to rebut the so-called "undisputed evidence."

There *is* therefore a very serious dispute, as a matter of fact, as to the correctness of the conclusions advanced by appellant's witnesses. The fact that other cities on the Great Lakes and elsewhere, some of which are nearly as great in size as Chicago was when the appellant's canal was built, have been able satisfactorily to solve their sewage and drinking water problems without recourse to the extreme method employed by appellant, and without suffering from typhoid or other epidemics, is sufficient to indicate that the appellant's witnesses have not said the last word upon the subject. Equally suggestive are certain inadvertent admissions to be found here and there both in the testimony and in appellant's brief.

I

The issues involved in the two suits and a brief history of the proceedings in the trial court

The issues presented by this appeal can not be thoroughly understood without a brief analysis of the pleadings in the two suits, which, although consolidated, do not present altogether identical questions. For convenience, these two suits will be referred to as (1) The Calumet River Suit and (2) The Main Channel Suit. Before undertaking this analysis we take this occasion to call the Court's attention to the fact that it is now *sixteen* years since the institution of the first suit. Six years (1908–1914) were consumed in the taking of testimony; for six years more (1914–1920) the case was held under advisement by Judge Landis; for three years more the case was pending on appellant's motion for a modification of the terms of the decree for an injunction which Judge Landis indicated he would enter, but never did. Against this delay the Government continuously protested. This Court will form its own judgment as to the sufficiency of Judge Landis's reasons for denying the Government a formal decree, to which he had recognized it was justly entitled. If the Government refrains from further comment on this matter, its reticence should not be regarded as an implied recognition of the sufficiency of Judge Landis's reasons.

For convenience we here set forth Section 10 of the River and Harbor Appropriation Act of

March 3, 1899 (30 St. at L., p. 1151, Ch. 425), for it is on this statute that the rights of the appellee are to a large extent based:

> That *the creation of any obstruction not affirmatively authorized by Congress*, to the navigable capacity of any of the waters of the United States *is hereby prohibited;* and it shall not be lawful to build or commence the building of any wharf, pier, dolphin, boom, weir, breakwater, bulkhead, jetty, or other structures in any port, roadstead, haven, harbor, canal, navigable river, or other water of the United States, outside established harbor lines, or where no harbor lines have been established, except on plans recommended by the Chief of Engineers and authorized by the Secretary of War; and *it shall not be lawful* to excavate or fill, or *in any manner to alter or modify the course, location, condition, or capacity of*, any port, roadstead, haven, harbor, canal, lake, harbor of refuge, or enclosure within the limits of any breakwater, or of the channel of *any navigable water of the United States, unless the work has been recommended by the Chief of Engineers and authorized by the Secretary of War prior to beginning the same.*

In our summary of the pleadings we refer to the appellee and appellant as complainant and defendant respectively.

A. Calumet River suit

The bill in this case was filed March 23, 1908. It sought to prevent the defendant from doing two

things: (1) reversing the direction in which the Calumet River flowed, clearly a "modification" of the condition of a navigable river within any definition of that term, and (2) the withdrawal of water from Lake Michigan in a different way and in a larger amount than was authorized by the Secretary of War. The answer of the defendant was filed March 23, 1908. The issues presented by these pleadings may be summarized as follows:

The bill averred that the Calumet River is one of the navigable waters of the United States. The answer admitted that the Calumet River is navigable for part of its course, but denied the navigability of its upper portion and certain branches. No point, however, has ever been made on this question for the obvious reason that it is admitted that what was proposed to be done by the defendant would affect the navigable portion of the river if it affected the river at all. The bill averred and the answer admitted the expenditure by the United States of money in the improvement of the Calumet River.

The bill averred and the answer admitted that on November 28, 1906, application was made by the defendant to the Secretary of War for a permit to reverse the flow of the Calumet River and to divert water through it from Lake Michigan; *that this application was refused by the Secretary of War on March 14, 1907;* that on September 18, 1907, the Board of Trustees of the defendant passed an order declaring that it intended to reverse the flow of the

Calumet River and to withdraw water from Lake Michigan through it for use in its channel *without the authorization of the Secretary of War*, unless the defendant was prevented by injunction from so doing. The bill alleged that it was the defendant's intention to divert 4,000 c. s. f. from Lake Michigan through the Calumet River and the answer admitted an intention to divert an amount from 2,000 to 4,000 c. s. f. (The diversion through this river having since been accomplished, we may now state that it at present amounts to 2,000 c. s. f. and that the channel is so constructed as to permit of an easy enlargement to 4,000 c. s. f.)

The bill alleged and the answer denied that the effect of this diversion would be to lower the level of Lake Michigan and its connecting rivers, channels, and harbors and to modify the condition and obstruct the navigable capacity of the said navigable waters of the United States. The bill alleged that there was neither an Act of Congress nor an authorization of the Secretary of War for the withdrawal of the water. *The answer denied that Section 10 of the Act of March 3, 1899, was of any binding force on the defendant and challenged the power of the Federal government to interfere with the proposed diversion.*

The answer thereupon proceeded to assert three affirmative defenses, which as will readily be seen, are the defenses upon which it places its chief reliance on this appeal:

(1) Congress, by the Acts of March 30, 1822 (3 St. at L. 659), and March 2, 1827 (4 St. at L. 234),

relating to a grant of land to aid the state of Illinois in the construction of the Illinois and Michigan Canal, conferred upon the state of Illinois an authority broad enough to include the diversion of water from Lake Michigan for the purposes of the Sanitary & Ship Canal. (It may be noted that these Acts were passed before the City of Chicago even existed.)

(2) That the water to be withdrawn from Lake Michigan was to be used for sanitary purposes, including the prevention of the pollution of the drinking water of Chicago; that the withdrawal was part of a general plan of sanitation of which the central feature was the Main Channel of the Sanitary District Canal with which the Calumet Channel was to be connected, and in view of the proposed use for the purposes of sanitation the withdrawal of the water was beyond the control of the Federal government, being comprised within the police power of the state.

(3) That the proposed work was in the interest of navigation; that the canal might be used as a part of a system of waterways connecting Lake Michigan with the Mississippi River and was therefore in harmony with the policy of both Federal and State governments to provide a navigable waterway between the Great Lakes and the Mississippi River.

On June 25, 1908, the complainant filed exceptions to the answer presenting the point that the three affirmative defenses were not admissible in this litigation. These exceptions were overruled on June 26, 1908, and, issue being joined by replication filed

on that day, the complainant proceeded to take evidence before a commissioner appointed by the court for that purpose.

The evidence of the complainant, which was directed to the questions of the effect of the diversion of the water upon the navigable capacity of the lakes and their connecting waters and the resulting injury to the interests of navigation, was concluded July 8, 1909. (Rec. Vol. I, pp. 428–445.) The defendant, instead of immediately attempting to meet the testimony of the United States on those points, again opened negotiations with the Department of War, and on June 27, 1910 (Rec. Vol. VII, p. 27), made application to the Secretary of War to open a channel from the Calumet River to its existing Main Channel so as to substitute two routes instead of one between Lake Michigan and its canal. On June 30, 1910, the Secretary of War granted a permit (see *infra*, p. 58) which in substance provided that, *subject to the control of the Secretary of War and his right to revoke the permit at will*, the Sanitary District might withdraw from Lake Michigan through the Chicago and Calumet Rivers together the same total quantity of water which it was then authorized to withdraw from the Chicago River, namely, 4167, c. s. f. It was further expressly provided that this permission by the Government should not affect in any way the friendly suit to determine the right of the Sanitary District to divert from Lake Michigan for sanitary purposes water in excess of the amount authorized by the

Secretary of War. This stipulation as to the pending litigation was observed by the defendant *and no amendment of the pleadings in the Calumet River suit has been made.* The issues upon the record are precisely as they were prior to the permit of June 30, 1910, and the case stands exactly as if the permit had not been granted. Nevertheless, in the face of the conditions of this permit, the defendant thereafter continued to maintain the position that it might reverse the flow of the Calumet River as a matter of right against the prohibition of the Secretary of War, and that it is entitled to withdraw water in an unlimited quantity from Lake Michigan so long as it is required for purposes of sanitation.

As is apparent from the appellant's brief (p. 11) work in this canal, which was stopped when the bill of complaint in the Calumet River suit was filed in 1908, was resumed after June 30, 1910. Its construction was completed in 1922 and its capacity as now constructed is approximately 2,000 c. s. f. It reverses at practically all times the flow of the Calumet and Little Calumet Rivers. It is designed for further widening to provide a maximum capacity of 4,000 c. s. f. (Appellant's Brief pp. 11–12, 13.)

The defendant, having made this temporary arrangement with the Secretary of War (which by express agreement was not to affect the litigation then pending) proceeded to take the evidence of witnesses to establish the desirability of using the water for sanitary purposes and to show that while there were other efficient methods for the disposition

of the sewage of the Calumet District, the dilution method, which required the diversion of water from the lake, was the cheapest. The last of these witnesses was examined on June 1, 1911 (Rec. Vol. 1, p. 482). The defendant did not then attempt to produce evidence contradicting the complainant's case as to the effect of the diversion of the water upon the condition and navigable capacity of the lakes. Instead, on February 5, 1912 (Rec. Vol. VII, p. 6) the defendant applied to the Secretary of War for permission to withdraw from Lake Michigan through the Chicago and Calumet Rivers not to exceed 10,000 c. s. f., such permission to be revocable at any time by the Secretary of War, and subject to such action as Congress might take in the premises. This application was heard extensively by the Secretary of War *and on January 8, 1913, was denied*. (Rec. Vol. VII, p. 7.) During the month of January, 1913, the War Department learned that appellant was diverting more than 4,167 c. s. f. in defiance of the order of the Secretary of War. Appellant's attention was called to its acts by communications from the United States Engineer at Chicago, and appellant, through its attorney, Mr. Adcock, requested that its rights be determined by suit for an injunction. (Rec., Vol. VI, pp. 3968–3973.) On March 18, 1913, the defendant renewed the taking of its evidence. The hearings before the Commissioner, at which were examined witnesses for the defense, and those in rebuttal for the government, proceeded until June 10, 1914. By agreement, the evidence taken in the

Calumet River suit was to be used also in the Main Channel suit involving the withdrawal of water from Lake Michigan through the Chicago River in excess of the amount authorized by the Secretary of War.

B. Main Channel suit

The bill in this case was filed October 6, 1913 and grew out of the refusal of the defendant to comply with the decision of the Secretary of War with respect to the amount of water to be withdrawn from Lake Michigan. The defendant, having refused to comply with the ruling of the Secretary of War, and persisting in diverting an amount of water in excess of 4,167 c. s. f., the United States filed this suit to enforce obedience to the order. The bill sought, therefore, to prevent the defendant from withdrawing water from Lake Michigan in excess of 4,167 c. s. f. The answer of the defendant was filed on January 16, 1914. The issues presented by these pleadings may be summarized as follows:

The bill charges and the answer admits that the Chicago River is a navigable water of the United States and that the United States has spent large sums of money in improving it; that on May 8, 1889, the defendant applied to the Secretary of War for authority to divert water from the Chicago River into its canal, and that the making of the applications and the granting of permits had taken place from that time on, as was charged in the bill. (These applications, permits, etc. will not be set forth here, as they are discussed at length below, *infra*.

pp. 37–67). They included, of course, the defendant's application of February 5, 1912 to increase the amount withdrawn through the Chicago and Calumet Rivers to 600,000 cubic feet per minute (10,000 c. s. f.) and the denial of this application on January 8, 1913. The bill alleged and the answer denied that the defendant had been withdrawing water from Lake Michigan in excess of 250,000 cubic feet per minute (4,167 c. s. f.) and that the effect of the withdrawal of an amount in excess of that authorized by the Secretary of War would be to modify the condition and obstruct the navigable capacity of the Great Lakes and their connecting channels and to modify the condition and capacity of the channel of the Chicago River and to inflict injury on the navigable interests of the United States.

In the remaining portion of the answer the defendant stated at length certain facts with reference to the history of its organization and the construction of the canal and reasserted the three affirmative defenses which it had set up in its answer in the Calumet River suit and on which it is now relying in this Court. These matters were, however, set up with considerable more detail. For example, the answer averred that unless the defendant was permitted to withdraw more than 4,167 c. s. f., it would be necessary for the city of Chicago to reconstruct its system of sewers at a cost of more than $100,000,000 and to maintain it at an expense which when capitalized would represent in the aggregate an investment of $240,000,000; that the sum of

$82,000,000 already spent by the defendant would be practically wasted. The answer also contained allegations of details to the effect that Congress had at various times appropriated money for the improvement of the Illinois River and for the purpose of investigating waterway projects connecting Lake Michigan with the Mississippi River, and from those acts of Congress the defendant suggested as a defense an implied authority to withdraw water from Lake Michigan without the express authorization of Congress and in defiance of the decision of the Secretary of War. Out of these allegations and others as to government projects for improving navigation between Lake Michigan and the Mississippi River (never authorized by Congress or approved by the Department of War) the defendant attempted to create a claim of laches, acquiescence, and implied approval on the part of the United States with respect to the construction of the canal. There were also allegations claiming an estoppel by reason of the institution of the suit by the government to compel the removal of the dam of the Economy Light & Power Company in the Desplaines River at Dresden Heights, Illinois, but this seems to have been abandoned, at least on this appeal, as an element of estoppel.

On February 28, 1914, the complainant filed its motion to strike all of the answer setting up these three affirmative defenses on the ground that none of the matters thus set forth constitute admissible de-

fenses in this case. As has already been stated, this motion was pending throughout the proceedings until the entry of the final decree by Judge Carpenter on June 18, 1923, and this decree was intended to be, and was understood by the parties to sustain the complainant's motion. By agreement, the evidence which had been taken in the Calumet River suit was to be used in this, the Main Channel suit, so far as applicable, with the same effect as if the commissioner had been designated and had taken testimony in the latter case. Further testimony was taken up to the month of December, 1914. Shortly thereafter, the case was submitted to Judge Landis on the record as made (including Volumes I to VII of the record now before this Court which have been rebound for the purpose of this appeal) and on the motion of the complainant.

C. Decision of Trial Court

The efforts of the Government to bring the case to an early conclusion and a final decree establishing its rights are partially revealed by the record. (Rec., Vol. II, pp. 3878–3880.)

Judge Landis kept the case under advisement for over six years, his reasons for the delay being set forth in the oral opinion which he finally rendered on June 19, 1920. (Rec. Vol. VIII, p. 149.) The pendency of the war, his understanding that there was a possibility of a compromise, and his indisposition as a citizen of Chicago to have microbes in his drinking water, were his assigned reasons. Judge Landis in effect found:

(1) That there was a substantial lowering of the surface of the Great Lakes by reason of the unauthorized diversion of water, together with a changing of the current of the Chicago River;

(2) That this lowering of the level constituted a creation of an obstruction to the navigable capacity of the Great Lakes, particularly with respect to the proof showing the depth of the harbors of the Great Lakes;

(3) That the power of Congress with respect to navigable waters having been exercised was paramount, and therefore the affirmative defenses relied on by the defendant were not admissible;

(4) That there should be an order striking those portions of the defendant's answer setting up the affirmative defenses;

(5) That an injunction should issue, its operation to be suspended for thirty days after the beginning of the next session of the Supreme Court of the United States.

On July 12, 1920, the defendant made a peculiar motion—that the court "reconsider its oral opinion and oral direction heretofore announced concerning the form of decree to be entered in said causes." In effect the motion asked that the decree enjoin the defendant only from diverting from Lake Michigan *more than 10,000 c. s. f.* on condition that if Congress or other competent governmental authority should provide for the construction in the St. Clair, Niagara, or St. Lawrence Rivers of works to compensate for any diminishing levels of the Great Lakes due to the

defendant's diversion, then the defendant should defray the expense and pay the cost of construction and maintenance of any such works upon request therefor by the United States. In connection with the motion the defendant offered and agreed to defray the expense, or to pay to the United States upon demand the cost of the construction and maintenance of such works in accordance with an ordinance which the defendant had passed on July 8, 1920. Certain portions of the record and testimony previously taken in the cause were cited in support of the motion.

The motion was later amended by averments to the effect that the defendant had passed an ordinance providing for supplementing the works already constructed by a program for the construction and operation of works for the purification of sewage so that within a period of twenty-five years such purification works should be constructed and in operation and that the amount of sewage and waste so passing into the Desplaines River should be at least 50 per cent less than that passing at the time of the motion. The amendment also averred the passage of a statute by the legislature of Illinois authorising the defendant to construct the works and carry out the program for sewage purification, as set forth in the ordinance.

Judge Landis resigned his position as judge on March 1, 1922, without entering any final order or decree. Thereafter the case was assigned to Judge Carpenter. On April 25, 1923, further testimony

was taken in behalf of the defendant before a commissioner. (Rec. Vol. VIII, pp. 175-223.) It was all received subject to the objection of the complainant and had to do with matters within the scope of the second affirmative defense of the defendant. It purported to show the cost of other methods of disposition of sewage and the time it would take to accommodate the works then constructed and any new system to the needs of the probable population of Chicago. There was also testimony to the effect that under the law of the State of Illinois the revenue that would be received by the defendant would not meet the probable expenses until the year 1945.

On June 18, 1923, Judge Carpenter entered an order denying the defendant's motion and refusing its offer. On the same day, Judge Carpenter entered a final decree enjoining the defendant from diverting or abstracting any waters from Lake Michigan in excess of 250,000 cubic feet per minute. The opinion of Judge Carpenter (Rec. Vol. VIII, p. 127) in substance adopts the opinion of Judge Landis as to the points in issue.

II

A review of the efforts of the appellant to obtain permission from the Federal Government to withdraw water from Lake Michigan, showing that there is no foundation in fact for the claim of invitation, acquiescence, and laches made by the appellant

We do not believe that appellant's Statement of the Case affords to this Court a sufficiently clear account of what transpired between the appellant

and the Federal authorities in connection with the unauthorized diversion of water from Lake Michigan. Throughout appellant's brief counsel for appellants have seen fit to substitute their own (and we believe unjustified) interpretation of official documents for the actual language of the documents. They have also ascribed purposes and intentions, particularly to the Secretary of War, for which there is no basis in the documents or elsewhere in the record. Inasmuch as these instruments speak for themselves, we shall now discuss them in chronological order:

A. The enabling act of the Illinois legislature, passed May 29, 1889

The statute under which the appellant was organized and which, together with certain amendments, is the source of its powers and duties, was enacted by the Illinois legislature on May 29, 1889, and is entitled, "An Act to create sanitary districts and to remove obstructions in the Desplaines and Illinois rivers." The Act is general in its terms and provides a method for the incorporation of municipal corporations in Illinois with authority to make provision for the drainage of the incorporated territory. We need not dwell on those portions of the statute having to do with the general powers of such corporations (see Rec. Vol. IV, p. 2327). The portions of the statute which are of chief interest to this case are found in Sections 20 and 23. These sections by explicit language contemplate the construction of a canal diverting water from Lake Michigan into the Desplaines or

Illinois River and require that it be constructed of sufficient size and capacity to maintain a continuous flow of not less than 300,000 cubic feet per minute (5,000 c. s. f.). They further require that if the population of the district draining into such channel should at any time exceed 1,500,000, the channel should be made and kept of such size that it will produce and maintain at all times an additional flow of not less than 20,000 cubic feet of water per minute for each 100,000 of the population of the district. It is manifest, therefore, that this statute requires the appellant not merely to take 10,000 c. s. f. (600,000 cubic feet per minute) but requires the appellant to take a considerable amount in excess of that for each 100,000 of population over Chicago's present population of 3,000,000. The purpose indicated by the statute, therefore, and confirmed by the acts of the appellant, as well as by its contentions that it is justified by consideration of the police power, is evidently to take an *unlimited* amount of water in defiance of any acts of Congress or rulings of the Secretary of War. As the population of the district increases nearly 70,000 a year, it thus asserts the right to augment annually its present unauthorized diversion of water to the extent of approximately 15,000 cubic feet per minute. Even were the appellant limited to 10,000 c. s. f., it would on its own admissions be violating the requirements of Sections 20 and 23 of the statute from which it derives its existence and power, and those sections would be at least partially invalid.

B. Condition of Federal law as to control of navigable waters at the time of the passage of the Illinois enabling act of May 29, 1889

At this time (1889) there was no general Federal statute with respect to the control of navigable waters. As is shown under our Point II (*infra*, p. 136) this Court had held that, as to modifications and improvements the effect of which was entirely within the boundaries of a state on navigable waters wholly therein, Congress had left the states free to act, their action being subject to what Congress might do when it saw fit to assume control. As to acts which were national or international in their scope or effect—and the navigability of the Great Lakes is of this character—the failure of Congress to legislate was, under the well established principle, an expression of its will that the subject should be free from restrictions or impositions by the state.

The diversion of such a large quantity of water from Lake Michigan with its consequent effect on the levels of the Great Lakes was a subject both national and international in its scope, and the silence of Congress did not give to the state of Illinois the right to create what was in fact a large navigable river flowing away from Lake Michigan and a very appreciable obstacle to the navigable capacity of Lake Michigan and the other Great Lakes.

C. The Federal Act of September 19, 1890

During the year following that in which the Sanitary District enabling act was passed, Congress

enacted a general law for the protection of the navigable waters of the United States. By Section 10 of the River and Harbor Appropriation Act of September 19, 1890, Ch. 907, 26 Stat. 454, it was provided—

> that the creation of any obstruction, not affirmatively authorized by law, to the navigable capacity of any waters, in respect to which the United States has jurisdiction, is hereby prohibited.

By Section 7 of the same Act it was made unlawful—

> to excavate or fill, or *in any manner to alter or modify the course, location, condition, or capacity* * * * of the channel *of said navigable water of the United States, unless approved and authorized by the Secretary of War.*

Thus it was made necessary, before modifying the condition or capacity of the navigable waters of the United States, to obtain the authorization of the Secretary of War.

As to the preliminary authority of law required in the case of an obstruction of a navigable water *wholly within the boundaries of a state*, this Court decided in the year 1899 in the case of *United States v. Bellingham Bay Boom Company*, 176 U. S. 211, that such authority might be conferred either by a law of Congress or by a law of the state passed before Congress had itself legislated upon the subject.

D. Organization of Sanitary District and preliminary work on the canal

The incorporation of the appellant was completed by a vote of the people in November, 1889 and its first Board of Trustees was elected in December, 1889. Nothing, however, was done with respect to the construction of a canal prior to the passage of the Act of Congress of September 19, 1890. Several years thereafter were spent in consideration of routes for the canal and estimates of the cost of construction. Plans for the canal were finally agreed upon and bids upon certain propositions were received on June 8, 1892. (Rec. Vol. IV, p. 2363.) The actual construction was not undertaken until 1893. Therefore, all work was done after Congress had provided that such work must have the affirmative approval of the Secretary of War.

E. Suggestions of Federal aid in construction of canal

From the very beginning, the relation of the proposed canal to the Federal government was the subject of consideration by both the state and federal authorities. The government engineers had been at work for many years upon plans for the improvement of the navigable waters connecting Lake Michigan with the Mississippi River, and when the Sanitary District Canal was first projected there were suggestions by those connected with the Sanitary District and by the office of the Chief of Engineers, that, in the construction of the canal, there should be cooperation on the part of the local

and federal authorities, and that the United States should contribute something toward the expense of building the canal. (See Rec. Vol. IV, p. 2362–3; 2172–4.) Nothing came of such proposals, however, and Congress granted no aid whatever for the construction of the canal.

F. Early assertion of Federal control with respect to obstructions to navigation

So far, however, as the construction of the canal involved any modification of the capacity or condition of any navigable waters of the United States, the federal authorities were prompt in asserting their paramount authority. For example, as early as August 24, 1892, before any actual work of construction had been undertaken, Capt. W. L. Marshall, United States Engineer at Chicago, sent to appellant's Board of Trustees a communication containing the following:

> The matter of Federal cooperation with you must necessarily soon come up, but I can readily see that you may prefer to bring it up as a distinct proposition. (Rec. Vol. IV, p. 2377.)

On May 23, 1893, Capt. Marshall sent a communication to the president of appellant's Board of Trustees which contained the following:

> As far as the obstructions to navigation in Chicago River are concerned, we will deal with them under United States laws, but in case these laws are silent, or where questions arise where under these laws things may be

done that may not be done under state and local laws, the custom of this office has always been to respectfully suggest to the Secretary of War that no action be taken until the local authorities expressed their assent, and that in no case should a permit be granted by the War Department until it be shown that the authorities of the State of Illinois expressed their concurrence in such action. (Rec. Vol. IV, p. 2378.)

In Capt. Marshall's report dated August 9, 1893 (contained in the report of the Chief of Engineers, 1893), there appears the following:

> Without criticizing in any way the local measures taken for local relief, it may be said that the state laws, if effectively executed for the purposes specified, seemingly require changes in the capacity of Chicago River and its branches that may increase, may diminish, or may even entirely destroy their value for commercial purposes. In any case under existing laws, no alteration in the capacity of Chicago River can be made without the consent of the Secretary of War, or without full examination by agencies established by Congress, and the execution of the state laws are therefore limited by superior authority. (Rec. Vol. IV, p. 2368.)

On March 22, 1895, Col. Poe, United States Engineer at Chicago, sent to the appellant's Board of Trustees a communication which was as follows:

> The Board of Engineers appointed by direction of the Secretary of War to consider and report upon "the probable effect of the opera-

tion of the Chicago Drainage Canal upon the lake and harbor levels and upon the navigation of the Great Lakes and their connecting waterways" would be pleased to receive from your Honorable Board of Trustees any information or data bearing upon the subject submitted to us, and especially the following:

First. *The conclusions arrived at from investigations* made by your authority or by others *as to the effects upon the levels of the great lakes by the operation of your Canal*, including any mathematical analyses and discussions of the question from which these conclusions have been arrived at.

* * * * *

Third. Whether any part of the inner harbor of Chicago, which includes Chicago River and its branches, will be utilized as part of the proposed Canal, and if so what amount of water you propose to take through these river channels.

* * * * *

In making these inquiries, the Board of Engineers consider that your Honorable Body is much interested in the solution of the questions submitted to us, and therefore desirous to aid as far as practicable in arriving at correct conclusions. (Rec. Vol. IV, p. 2380–1.)

The appointment of the Board of Engineers referred to in the foregoing letter followed the observations published in the Chief of Engineer's report for 1893 which indicated a lowering of the surface levels

of Lake Erie of approximately 5¼" for a diversion of 10,000 c. s. f. at Chicago.

The Chief of Engineer's report for 1893 contains a statement to the effect that the city of Chicago expects to turn into the channel of the Illinois River at some future time 5,000 c. s. f. of Lake Michigan water and at some more remote period 10,000 c. s. f., but not probably within a generation. (Rec. Vol. IV, p. 2373.)

The Board of Engineers mentioned in Col. Poe's letter of May 22, 1895, made its report on August 16th of that year. In this report we find the following:

> It is true there is nothing showing that the consent of Congress had been asked for this enterprise. Certain that the subject had not been treated as an Inter-State affair; to say nothing of its being an International affair.
>
> * * * * *
>
> But it is sufficient to say that all that is now changed. The adopted policy is to defend, as well as improve all water courses, now navigable, or probably navigable in the reasonably close future. Waterways are under the charge of the United States, and there is no likelihood of their being abandoned for some time to come. * * *
>
> *The abstraction of 10,000 cubic feet* of water per second from Lake Michigan *will lower the levels of all the lakes of the system except Lake Superior and reduce the navigable capacities of all harbors* and shallows throughout the system to an extent that may be determined,

> if at all, by actual measurements only. Under the laws of the United States *these changes in capacity can not be made without Federal authority*, and to enable the executive officers of the United States to act advisedly in the matter it is necessary in the opinion of the Board not only that these measurements be taken, but that the money cost of restoring the navigable depths in channels and harbors be carefully estimated. (Rec. Vol. VI, p. 3936–39.)

At the very outset, therefore, we find that the United States asserted its paramount control with respect to the creation of obstructions to navigable waters. Indeed, shortly after the actual work of construction was begun, the Department of War put squarely up to the appellant the effect of the operation of this canal upon lake and harbor levels and upon the navigation of the Great Lakes and their connecting rivers.

G. Permit of July 3, 1896, and proceedings with reference thereto

If there were any doubt that the question of the effect of the diversion of water upon lake levels was under consideration by both parties from the very beginning and that the paramount control of the United States was asserted on its part and conceded by the local authorities, an end is put to that doubt by correspondence relating to the permit of July 3, 1896, to make certain changes in the capacity of the channel of the Chicago River.

On June 16, 1896, the president of appellant's Board of Trustees wrote to the Secretary of War, from which we quote the following:

> The work of the Sanitary District of Chicago has progressed so far that it is now necessary for us to enter upon that which must be done in the Chicago River to make available the artificial channel which we have under construction from Robey Street, Chicago, to Lockport in Will County, twenty-eight miles distant.
>
> Our connection with Lake Michigan must be through the Chicago River with the West Fork of the South Branch of which we make a junction at Robey Street. We send herewith a map showing in a general way our plans for improving the Chicago River by widening and deepening at the points indicated thereon by red hatchings and by figures which refer to explanations given in the legend on the map.
>
> * * * * *
>
> *We ask your permission to proceed with the work upon the lines indicated and so far as is consistent with propriety the cooperation of the United States Engineering Department.* (Rec. Vol. VI, pp. 3572–3.)

On June 24, 1896, Major Marshall of the Corps of Engineers at Chicago, wrote to the Chief of Engineers at Washington, saying among other things:

> As far as the work itself is concerned there can be no objection to it, as in every case the

navigable channel of Chicago River will be improved, and at this stage I am unable to do otherwise than to recommend the granting of the authority sought.

The question that must come up later for the action of the War Department, to wit: Whether the improved channel of Chicago River will be sufficient to carry 300,000 cubic feet of water per minute without lessening or destroying the navigability of Chicago River, or whether the City of Chicago will be allowed by the United States and Great Britain to take any water at all from the Great Lakes, with the inevitable result of lowering their levels is not now under investigation, and is one that will not probably be settled or decided by executive officers. It is or may rather be considered an international question. (Rec. Vol. VI, p. 3573.)

Major Marshall went on to recommend that the necessary authority be granted under five conditions, the second and third of which were as follows:

(2) That this authority shall not be interpreted as approval of the plans of the Sanitary District of Chicago to introduce a current into Chicago River. This latter proposition must hereafter be submitted for consideration.

(3) That it will not cover obstructions to navigation by reason of this work while in progress, or when completed. (Rec. Vol. VI, p. 3574.)

On July 3, 1896, Acting Secretary of War Doe granted a permit to make the requested changes on

the conditions recommended by Major Marshall including the following:

> (2) That the authority shall not be interpreted as approval of the plans of the Sanitary District of Chicago to introduce a current into Chicago River. This latter proposition must be hereafter submitted for consideration.
>
> (3) That it will not cover obstructions to navigation by reason of this work while in progress or when completed. (Rec. Vol. VI, p. 3574.)

On October 28, 1897, the appellant applied for a permit to widen the Chicago River between Quincy and Harrison Streets. (Rec. Vol. VI, p. 3575.) In response to this application, the Secretary of War issued a permit which was subject to exactly the same conditions as the permit of July 3, 1896, and included the following:

> (2) That this authority shall not be interpreted as approval of the plans of the Sanitary District of Chicago to introduce a current into Chicago River. This latter proposition must be hereafter submitted for consideration.
>
> (3) That it will not cover obstructions to navigation by reason of this work while in progress, or when completed. (Rec. Vol. VI, p. 3576.)

On November 12, 1898, the appellant applied for a permit to build a cofferdam around the east side of the center pier of the Adams street bridge, on the Chicago River. This permit was granted on November 30, 1898. It recited, as did also the permit to

widen the Chicago River between Quincy and Harrison Streets, the Act of Congress making it unlawful to build structures of this kind or modify the condition of the navigable waters of the United States without the authority of the Secretary of War. (Rec. Vol. VI, pp. 3579–3581.)

On December 16, 1898, the appellant applied for a permit to remove bridges at the Taylor Street crossing and replace them with bridges of a different type. This permit was granted on January 13, 1899, and like its predecessors recited the paramount authority of the federal government in the premises. (Rec. Vol. VI, p. 3579–81.) A similar application was made by the appellant on February 27, 1899, and a similar permit issued by the Secretary of War on March 10, 1899, with respect to another bridge at Taylor Street. (Rec. Vol. VI, pp. 3584–5.) Similar application was made on April 26, 1899, for the construction of a cofferdam along the west side of the Chicago River, and on May 12, 1899, a permit was issued by the Secretary of War similar in form to the preceding ones, expressly reciting the authority of the War Department in the premises. (Rec. Vol. VI, pp. 3582–3583.)

H. The Federal Act of March 3, 1899

Before the completion of its channel by appellant and before any application had been made for the diversion of water from Lake Michigan, Congress changed the law relating to the control of navigable waters of the United States in certain important

respects. Obstruction of navigable waters wholly within the boundaries of the state authorized by the state legislature had been held to be "affirmatively authorized by law" (within the meaning of that phrase as it appeared in Section 10 of the Act of Congress of 1890) in the case of *United States* v. *Bellingham Bay Boom Company*, 176 U. S. 211. Among the changes made by the new Act of 1890 was the substitution of the words "affirmatively authorized by *Congress*" with the result that the new Act prohibited the creation of any obstructions without the authorization of Congress. Section 10, with which the present suits are vitally concerned, has already been set forth (supra, p. 8) and is analyzed elsewhere (infra, p. 174). We may state here, however, that both analysis of the statute and the history of the legislation leads inevitably to the conclusion that it was the purpose of Congress, as expressed in the most sweeping language, not only to prohibit obstructions but also to forbid that there should be, after the passage of the Act of March 3, 1899, any alteration or modification of the course, location, condition or capacity of navigable waters of the United States without authority of the Department of War; that it was not necessary that such proposed alteration or modification should amount to an obstruction of the navigable capacity of the waters, but permission was required in all cases even though the proposed alteration or modification might amount to an *increase*, rather than a decrease, of the navigable capacity of the waters

To invoke the statute it became necessary thereafter only to show that the proposed work does in fact amount to an alteration or modification of the course, location, condition or capacity of such navigable waters.

1. Application and permit for formal permission to open channel of the sanitary district to connect it with the Chicago River

It has already been noted that in the permits already issued by the Secretary of War the express reservation had been made—

> That this authority shall not be interpreted as approval of the plans of the Sanitary District of Chicago to introduce a current into Chicago River. This latter proposition must be hereafter submitted for consideration.

There was the further reservation and condition—

> That it (the permit) will not cover obstructions to navigation by reason of this work while in progress or when completed.

In the light of these conditions it is difficult to understand appellant's contention that these early permits, which were limited specifically to authority to make certain improvements in the channel of the Chicago River, are to be construed as any authority whatsoever to introduce a current into that river or to create any obstruction either in that river or elsewhere. That the appellant did not at that time so construe these permits is apparent from its application to the Secretary of War on April 22, 1899, *for permission to open the channel constructed by it as*

soon as it was completed. In connection with this application the appellant submitted to the Secretary of War a draft of permit which it requested be issued. This draft, after various recitals of work done by the appellant, contained further recitals specifically mentioning the permits of July 3, 1896 (in connection with which it recited "said approval being subject to limitations therein set forth"), and the other permits of November 16, 1897, November 30, 1898, January 18, 1899, and March 10, 1899. The draft also contained the following very significant admission:

> Whereas, it is necessary, under the Act of Congress of September 19, 1890, that authority shall issue from the War Department under which the said Sanitary District may cause the waters of the Chicago river to flow to the west into the main channel of the said District. (Rec. Vol. VI. p. 3849.)

This application was referred to Major Marshall, United States Engineer in charge at Chicago. On April 24, 1899, Major Marshall reported to the Chief of Engineers (a portion of his report being quoted in appellant's brief, p. 39). Other portions of the report which appellant omitted to quote are the following:

> It is a strange fact that this city has expended, or will expend, over $30,000,000 *with the intention of diverting an apparently unlimited amount of water from the Great Lakes* to the Mississippi drainage area for

sanitary purposes, *without finding out whether such diversion would be allowed by the great interests of the United States* and the Colonies of Great Britain along the chain of Great Lakes in the navigation of the rivers and harbors of the Great Lakes. *Now they ask the authority of an executive officer of the United States to open a channel that will, to some unknown extent, lower the levels of all the Great Lakes below Lake Superior and of their outlets,* introduce a current, also unknown, and not to be ascertained otherwise than by actual experiment, in Chicago river, the most important navigable river of its length on the Globe, but which is already obstructed by bridges, masses of masonry and bends, and of difficult navigation at best.

The possible effects of this diversion are not known further than that to some unknown degree they will be injurious. Whether the amount of this injury will be so small as to be accepted by the interests affected, in view of the manifest advantages to and apparent necessities of their neighbors, cannot be determined by other than the interests themselves.

It is clear to me that I am not competent to make a recommendation as to what should ultimately and definitely be done. (Rec., Vol. VI, p. 3586.)

Major Marshall's report then discusses the probable effect of the opening of the channels on the levels of the Great Lakes and expresses his opinion that the abstraction of from 300,000 to 600,000 cubic feet per minute (5,000 c. s. f. to 10,000 c. s. f.) would permanently lower Lakes Michigan, Huron, and Erie

from three to eight inches, corresponding to an extreme reduction of from 160 to 466 tons in the carrying capacity of the large vessels of the lakes. Major Marshall further says:

> But the State law is unlimited in its requirements. 20,000 cubic feet per minute must be taken from Lake Michigan for each 100,000 population of the district; already nearly 400,000 cubic feet must be taken, and at the same ratio of increase for a few decades, in a very short time there must be taken 1,000,000 cubic feet per minute under this indefinite law. *The amount should be limited and the injurious effect stopped somewhere.*

His report then discusses the uncertain results and dangers to navigation in the Chicago River by reason of the current to be introduced, suggests that the entire subject be referred to Congress for final solution, and that only a conditional permit or authority be granted to appellant upon the same conditions which the Secretary of War ultimately inserted in the permit which was granted. (Rec. Vol. VI, p. 3586; Appellant's Narrative, pp. 478–481.)

On May 8, 1899, the Secretary of War granted a permit to open the channel. After reciting portions of Section 10 of the Act of Congress of March 3, 1899, and the intention of the appellant to introduce a current into this canal of 300,000 cubic feet per minute, the permit certifies that—

> the Secretary of War hereby gives permission to the said Sanitary District of Chicago to open the channel constructed and cause the water

of Chicago River to flow into the same, subject to the following conditions:

1. That it be distinctly understood that it is the intention of the Secretary of War to submit the questions connected with the work of the Sanitary District of Chicago to Congress for consideration and final action, and that this permit shall be subject to such action as may be taken by Congress.

2. That if, at any time, it become apparent that the current created by such drainage works in the south and main branches of Chicago river be unreasonably obstructive to navigation or injurious to property, the Secretary of War reserves the right to close said discharge through said channel or to modify it to such extent as may be demanded by navigation and property interests along said Chicago river and its south branch.

3. That the Sanitary District of Chicago must assume all responsibility for damages to property and navigation interests by reason of the introduction of a current in Chicago river. (Rec. Vol. VII, pp. 1–2.)

J. Permits of July 11, 1900

On July 11, 1900, in response to appellant's applications of April 26, 1900, and June 7, 1900, the Secretary of War granted permits to the appellant to make changes in the Chicago river near Lake Street, 12th Street, and Ashland Avenue. In view of the extreme assertions made in appellant's brief (without foundation in the record) as to the purpose and intent of these permits, we call specific attention to

the language of the permits which recite among other things that they do—

> not in any way invalidate, waive or affect the right of the Secretary of War to regulate or revoke the permit granted under date of May 8, 1899, to the Sanitary District of Chicago, to divert the waters of the Chicago river and cause them to flow into the artificial channel. (Rec. Vol. VII, p. 43.)

These permits of July 11, 1900, then recited the conditions upon which the permit of May 8, 1899, was granted. There is nothing in the record to support appellant's frequent assertions that the Secretary of War gave any promise, or made any statement, or obligated the United States in any way, to increase the authorized diversion of water when the work under these permits of July 11, 1900, should be completed. The express recitals of the permits negative the inferences which appellant repeatedly states as matters of fact.

K. Modifications of permit of May 8, 1899

On April 9, 1901, the permit of May 8, 1899, was modified by the Secretary of War by directing the appellant to regulate the diversion from the river into the canal so that the maximum flow through the Chicago River and its south branch should not exceed 200,000 cubic feet per minute. The permit recited the second condition contained in the permit of May 8, 1899, and further recited that—

> it is alleged by various commercial and navigation interests that the present discharge from

> the river into the Drainage Canal sometimes exceeds three hundred thousand (300,000) cubic feet per minute, causing a velocity of nearly three (3) miles per hour, which greatly endangers navigation, in the present condition of the river. (Rec. Vol. VII, pp. 2–3.)

The appellant never questioned the authority of of the Secretary of War to make this modification, and, indeed, it could not, for it was clearly an exercise of the right expressly reserved in the original permit.

On July 23, 1901, the Secretary of War, in response to an application of appellant, made a further modification permitting a flow of 300,000 cubic feet per minute (5,000 c. s. f.) between the hours of 4 P. M. and 12 o'clock midnight—

> which approval will be subject to revocation by the department in case the increase shall prove to be dangerous to navigation. (Rec. Vol. VII, p. 3.)

On December 5, 1901, in response to a further application of the appellant, the permit was again modified to permit the appellant to divert not exceeding 250,000 cubic feet per minute (4167 c. s. f.) throughout the twenty-four hours of the day upon the following conditions:

> 1. That this permission shall be in lieu of the present authorized rates of flow as stated above.
>
> 2. *That the permission herein given shall be subject to such modification as in the opinion of*

the Secretary of War the public interests may from time to time require.

8. That said Sanitary District of Chicago shall be responsible for all damages inflicted upon navigation interests by reason of the increase in flow herein authorized. (Rec. Vol. VII, pp. 4–5.)

This permit of December 5, 1901, again expressly recited the second condition contained in the original permit of May 8, 1899, and was clearly an exercise of the right of the Secretary of War reserved in that permit and the others which had followed it. The appellant never questioned the right of the Secretary of War to make the modification as, indeed, it could not.

On December 29, 1902, the appellant applied for a further modification so as to permit it to increase the flow to 350,000 cubic feet per minute during the closed season of navigation. The application stated, among other things:

We recognize your responsibility as the guardian of the interests of navigation. (Rec., Vol. VI, p. 3862.)

On January 17, 1903, an amended permit was issued by the Secretary of War giving the appellant permission to increase the flow from 250,000 to 350,000 cubic feet per minute until March 31, 1903—

after which date it shall be reduced to 250,000 cubic feet per minute, as now authorized, upon the following conditions:

1. That the permission herein given shall be subject to such modification as in the opinion

of the Secretary of War the public interests may from time to time require.

2. That said Sanitary District of Chicago shall be responsible for all damages inflicted upon navigation interests by reason of the increase in flow herein authorized. (Rec., Vol. VII, pp. 5–6.)

This permit contained recitals calling attention to the original permit of May 8, 1899, and the permit of December 5, 1901, and particularly the condition contained in the latter permit—

> *that the permission herein given shall be subject to such modification as in the opinion of the Secretary of War the public interests may from time to time require.* (Rec. Vol. VII, p. 5.)

So far as the Main Channel is concerned, this permit was the last one granted and it is by its terms and by the terms of the permit of December 5, 1901, that the right of the appellant to divert water from Lake Michigan must be determined.

L. Amendment of May 14, 1903, by Illinois Legislature to enabling act of May 29, 1889

On May 14, 1903, the Illinois legislature passed a law enlarging the corporate limits of appellant so as to include what are known as the Calumet and North Shore Districts. The Act provided for the navigation of the channels created by the appellant and gave authority to construct dams, water wheels, *and other works necessary to develop and render available the power arising from the water passing through its channels.*

Section 27 of the Act provided for the building of the Calumet Canal, giving the appellant authority to construct a channel *across* the Illinois and Michigan Canal. Section 27 further required appellant to—

> maintain the same proportion of dilution of sewage * * * as is now required by the Act creating said Sanitary District—

namely, 20,000 cubic feet per minute for each 100,000 inhabitants of a district. Section 27 further made provision for preventing any interference with the navigation of the Illinois and Michigan Canal by connecting the Main Channel of the Sanitary District with the upper basin of the Illinois and Michigan Canal at Joliet by a channel of specified dimensions equipped with the necessary locks. Sections 5 and 6 gave specific authority for the developing of water power and the conversion of such power into electrical energy and the sale and disposition of such energy to private persons or corporations. Section 8 of the Act provided:

> The said Sanitary District shall, at the expense of said District, in all respects comply with the provisions of the acts of Congress of March 30, 1822, and March 2, 1827, as construed by the courts of last resort of the State of Illinois and of the United States, in relation to the Illinois and Michigan Canal, so far as it affects that portion of the Illinois and Michigan Canal vacated or abandoned by the terms of this Act.

M. Findings of U. S. Lake Survey and International Waterways Commission

After the granting of the initial permit to the appellant to open its channel on May 8, 1899, the investigations for the purpose of determining the effect of the diversion upon the lake levels were continued by the United States Lake Survey.

On June 13, 1902 (32 Stat. 373), Congress passed a law providing for the formation of the International Waterways Commission, to be composed of three members from the United States and three from Canada. The duties of this commission were to investigate and report upon the conditions and uses of the waters adjacent to the boundary lines between the United States and Canada, including all of the waters of the lakes and rivers whose natural outlet is by the River St. Lawrence to the Atlantic Ocean; also upon the maintenance and regulation of suitable levels, and also upon the effect upon the shores of those waters and the structures thereon, and upon the interests of navigation, by reason of the diversion of these waters from or change in their natural flow; and further to report upon the necessary measures to regulate such diversion, and to make such recommendation for improvements and regulations as should best subserve the interests of navigation in those waters.

The report of the International Waterways Commission on January 4, 1907, is discussed elsewhere and its findings set forth (*infra*, p. 74). The findings of the commission as to the lowering of levels by a

diversion of 10,000 c. s. f. at Chicago were substantially the same as were established by the evidence in this case. The report of the commission concluded with certain recommendations, among which was the following:

> The preservation of the levels of the Great Lakes is imperative. The interests of navigation in these waters is paramount, subject only to the right of use for domestic purposes, in which term is included necessary sanitary purposes.
>
> * * * * *
>
> A careful consideration of all the circumstances leads us to the conclusion that the diversion of 10,000 cubic feet per second through the Chicago river will, with proper treatment of the sewage from areas now sparsely occupied, provide for all the population which will ever be tributary to that river, and that the amount named will therefore suffice for the sanitary purposes of the city for all time. Incidentally it will provide for the largest navigable waterway from Lake Michigan to the Mississippi river which has been considered by Congress.
>
> We therefore recommend that the Government of the United States prohibit the diversion of more than 10,000 cubic feet per second for the Chicago Drainage Canal. (Rec. Vol. IV, pp. 2432–3.)

N. Decision of Secretary of War on application of Sanitary District to withdraw water through Calumet River

On November 28, 1906, the appellant applied to the Secretary of War for a permit to reverse the flow of

the Calumet River and to divert water from Lake Michigan through that river into a channel which it was to construct and which was to connect with its Main Channel. After the report of the International Waterways Commission on January 4, 1907, above mentioned, the Secretary of War on March 14, 1907, made his ruling, which was transmitted to the appellant. His communication recited Section 10 of the Act of Congress of March 3, 1899. It further recited that the question of whether the Chief of Engineers had power to recommend, or the Secretary of War to permit, such a change in the flow of a river had been submitted to the Judge Advocate General, who held that the case was one in which they had such power. The ruling further recited the recommendation of the Chief of Engineers which contained the following:

> 3. In my opinion, this abstraction will undoubtedly lower the levels of all the waters of the Great Lakes, except those of Lake Superior, and thus diminish the navigable capacity and depth of the various channels and harbors which have been deepened and improved under authority of Congress.
>
> 4. Leaving out Lake Superior, there are more than 100 works of river and harbor improvements on the Great Lakes and their connecting waters for which appropriations aggregating more than $80,000,000.00 have been made. The application of this vast sum has resulted in securing and maintaining specified depths and widths of channel, which Congress

has decided to be required for the accommodation of the traffic using those waters.

5. To diminish these depths, even to a slight extent, would not only prove a serious injury to the traffic, but would practically undo the work which has been accomplished by Congressional direction, and necessitate the expenditure of further large sums of money for restoration. Any project that tends, in a measure, to annul or reverse the orders of Congress, as expressed in the various river and harbor acts appropriating funds for improving the harbors and channels connecting with the Great Lakes, should meet the disfavor of the Department, unless it has been sanctioned by that body. In my judgment such a project is the one under consideration, and for this reason I am unwilling to recommend favorable action thereon, assuming that the Department is empowered to take such action, as is held by the Judge Advocate General.

The communication of the Secretary of War then proceeded to state:

The decision of the Chief of Engineers and its final character has made it unnecessary for me to consider the merits of the question, but I may say this much, that the application for a change in the Calumet River is to be made the basis for the withdrawal of a large amount of water from Lake Michigan and that all interested in the enormous lake traffic view the settlement of the question with grave apprehension. Added to this, is the international complication which is likely to arise in the

threatened lowering of the lake level in the ports and harbors and canals of Canada. On the other hand, it is maintained with great emphasis and elaboration of detail that the change in the Calumet River is essential to the healthful sanitation of Chicago, and that the threatened injury to navigation is so small as to be negligible.

Between two such great interests, the decision must be affected more or less by large public policy and expediency, and while I agree in the construction of the Judge Advocate General that the issue is left by statutes to the recommendation of the Chief of Engineers, and the concurrent decision of the Secretary of War, it may be fortunate that circumstances now require submission of this question of capital and national importance to the Congress of the United States. (Rec. Vol. VII, pp. 23–25.)

O. Wilmette permit

On September 11, 1907, the Secretary of War, in response to application of the appellant on September 2, 1907, issued a permit authorizing appellant to connect Lake Michigan at Wilmette, Illinois, with the North branch of the Chicago River. This permit contained the following condition, among others:

> That the total diversion of water from Lake Michigan through the Chicago river into the Illinois river shall be no greater than already authorized by past War Department permits. (Rec. Vol. VII, p. 26.)

P. The ordinance of the appellant asserting its independence of Federal control

As soon as it had obtained its permit for the construction of the Wilmette channel, subject to the limitation as to total diversion of water already mentioned, and while it was accepting the benefits of that permit and acting thereunder, the appellant proceeded on September 18, 1907, to pass an order declaring its intention to reverse the flow of the Calumet River and to divert water from Lake Michigan without the authority of the Secretary of War unless restrained by a court proceeding at the instance of the United States government. (Rec. Vol. VIII, p. 7.) The sole justification for its defiance of federal authority is to be found in the following recital contained in said order:

> Whereas, This board is advised that it has the right and that it is its duty under the laws of the State of Illinois to construct its said channel and reverse the flow of said Calumet river, *notwithstanding the refusal of the Secretary of War to issue a permit authorizing the same*, for the purpose of furnishing the proper sanitary method of disposing of the sewage of the territory and inhabitants contiguous to the said proposed channel and within the corporate limits of the Sanitary District of Chicago, and *unless restrained by a court having jurisdiction of the subject matter at the instance of the United States Government*.

It should be noted that neither in this order nor at any time prior thereto was any claim made

that appellant had authority under the Acts of Congress of 1822 and 1827 relating to the Illinois and Michigan Canal. This idea was clearly an afterthought.

Q. The Calumet permit of June 30, 1910

Following the passage of appellant's order of September 18, 1907, the appellee filed the Calumet River suit on March 23, 1908, to enjoin the reversal of the flow of the Calumet River and the diversion of water through that river from Lake Michigan. After the complainant (appellee) had concluded the taking of its evidence showing the effect on the lake levels of the proposed diversion, the appellant on June 27, 1910, made another application to the Secretary of War for permission to open the channel through the Calumet River so as to substitute two routes instead of one between Lake Michigan and the Main Canal, *it being understood that the total quantity of water to be withdrawn from Lake Michigan was not to exceed that already authorized by the Secretary of War*. On June 30, 1910, the Secretary of War, acting upon this application, granted such a permit—

> subject to all pertinent conditions of the existing permissions and to other express conditions as follows:
>
> (*a*) That it be distinctly understood that it is the intention of the Secretary of War to submit the questions connected with the work of The Sanitary District of Chicago to Congress for consideration and final action, and that

this permit shall be subject to such action as may be taken by Congress.

(*b*) That if, at any time, it become apparent that the current created by such drainage work in the Calumet, as well as Chicago rivers, be unreasonably obstructive to navigation, or injurious to property, the Secretary of War reserves the right to close the discharge through said channel or rivers, or to modify it to such an extent as may be demanded by navigation and property interests along said rivers.

(*c*) That The Sanitary District of Chicago must assume all responsibility for damages to property and navigation interests by reason of the introduction of a current in the Calumet as well as Chicago river.

(*d*) That the amount of water withdrawn from Lake Michigan, through the Chicago and Calumet rivers together, shall not exceed the total amount of 250,000 cubic feet per minute (4,167 cubic feet per second) already authorized to be withdrawn through the Chicago river alone.

(*e*) That the permission herein given shall be subject to such modification as in the opinion of the Secretary of War the public interests may from time to time require.

(*f*) That this permission shall in nowise affect or in any manner be used in the friendly suit now pending in the Circuit Court of the United States for the Northern District of Illinois brought by the United States of America against the Sanitary District of Chicago, to determine the right of the said

Sanitary District to divert from Lake Michigan for sanitary purposes an amount of water in excess of that now being diverted, without having first obtained a permit from the Secretary of War.

(*g*) That the War Department shall have free access at all times to the water-flow records of the Sanitary District of Chicago and free access also to the regulating works and all other parts of its canals for the purpose of checking records or making water-flow measurements.

(*h*) That the plans for the proposed work shall be submitted to and approved by the Chief of Engineers and the Secretary of War.

(*i*) That the work shall be subject to the supervision and approval of the Engineers Officer of the United States Army in charge of the locality. (Rec. Vol. VII, pp. 27–29.)

The recitals of the permit leave no doubt as to the reasons of the Secretary of War for his action. They show that—

> So long as the water flow remains unchanged there seems to be no special objections to its extension to both rivers instead of confining it to a single one, especially since if the new (Calumet) route be developed later to a navigable state the double route will be advantageous to navigation interests.

B. Application of February 5, 1912

The appellant then proceeded to introduce certain evidence in the Calumet River suit as to the alleged necessity for using the water for sanitary purposes

(Rec. Vol. I, pp. 445–564), but no evidence as to the effect of the diversion upon lake levels was produced. On February 5, 1912, the appellant applied to the Secretary of War "for an enlargement" of the terms of the permit of May 8, 1899, as modified by the permits of December 5, 1901, and June 30, 1910. The application was for permission—

> to withdraw from Lake Michigan through the Chicago river and Calumet river not to exceed 10,000 cubic feet of water per second; such permission to be revocable at any time by the Secretary of War, and subject to such action as the Congress of the United States may see fit to take in the premises. (Rec. Vol. VII, p. 7.)

There were extended hearings before the Secretary of War upon this application. (Rec. Vol. VI, pp. 3601–3845). It was stipulated in these cases that the proceedings before the Secretary of War are to be considered in evidence with like effect as if witnesses were called and original exhibits produced and identified herein. (Rec. Vol. VI, p. 3601.)

There was opposition to the granting of the permit on the part of members of Congress and other persons representing towns and cities in Minnesota, Michigan, Wisconsin, Ohio, and New York. The granting of the permit was also opposed by the representatives of various navigation interests of Chicago and property owners and residents throughout the entire Illinois valley. The opposition of the Chicago interests centered upon the effect of the increased flow in producing a current in the Chicago river which would

be extremely detrimental to navigation. (Rec. Vol. VI, p. 3616.)

Statements that the local situation was extremely critical; that even under the present flow navigation in the river was carried on at great hazard; and that any increase in the velocity of the current would mean disasters were made by the vessel owners and representatives of the Association of Lake Lines.

There was opposition to the granting of the permit on the part of representatives of the Canadian government as well as representatives of Canadian navigation interests. Briefs on behalf of the Canadian government were submitted in opposition to the application. (Rec. Vol. VI, pp. 3630–3631; 3711–3732.) The grounds urged in the briefs included the diminishing of the capacity of navigable waters of the United States and Canada and infliction of injury upon the navigation interests of Canada; also the terms of the Boundary Waters Treaty of January 11, 1909.

As to the effect of the withdrawal of the water on lake levels, the statement of the appellant, submitted by its attorney and its Chief Engineer, substantially admitted the correctness of the calculations as to the probable lowering of levels. (Rec. Vol. VI, pp. 3701–2.) See also the opinion of Lieut. Col. Zinn, Engineer in charge at Chicago. (Rec. Vol. VI, pp. 3732–3737.)

8. Decision of Secretary of War on January 8, 1913, denying appellant's application for increased diversion

After ample opportunity had been given to the appellant to be heard, the Secretary of War announced his finding on January 8, 1913. The document incorporating his findings is of some length and may be found set forth in full in the record. (Rec. Vol. VII, pp. 7–17.) We quote, however, portions of that document as follows:

> It is clear that even under the conditions heretofore manifested on these applications the proposition to divert the waters of Lake Michigan into another watershed has not been entertained without hesitation and careful restriction by my predecessors. The propriety of obtaining congressional sanction for the project has been pointed out from the beginning; and the form in which the permit has been granted, even for the moderate amount of diversion permitted, has been so phrased as to indicate that the permission was predicated upon the absence of any substantial injury to commerce.
>
> * * * * *
>
> In the argument before me it was urged that the present canal represented the growth and development of a national policy expressed in two acts of Congress, 1822 and 1827, which authorized the construction of a canal "to connect the Illinois river with Lake Michigan," thus connecting the two watersheds. (Acts of Mar. 30, 1822, and Mar. 2, 1827.) But these statutes authorized a canal for the purpose of navigation and not sanitation. (*Mis-*

souri v. *Illinois*, 200 U. S. 526.) The Illinois and Michigan canal, actually constructed under their authority, derived its water for navigation purposes from the Calumet, Desplaines, and Chicago rivers, and not from the lakes. And although in the latter part of its existence, it was used to a very slight extent to help purify the waters of the Chicago river and thus sanitate the city of Chicago, such a purpose could not have been dreamed of at the time its construction was authorized by Congress, 90 years ago. I can not see that its authorization and construction offer the slightest congressional sanction for the great canal now under discussion, which was not even contemplated until much more than half a century later. Even at the time when the present canal was constructed and opened it is very evident that its ultimate possible effect upon the navigation of the Great Lakes was not clearly realized by those interested in that navigation.

The Secretary of War then states his conclusion—

that the withdrawal of 10,000 cubic feet per second would substantially interfere with the navigable capacity of the Great Lakes and their connecting rivers,

and sets forth the amount of the reductions (infra, p. 72). Every argument now made by the appellant by way of affirmative defense was presented to and passed upon by the Secretary of War. He reached the conclusion that there would be substantial injury to the improvements effected by the United States and Canada in harbors and rivers on the Great Lakes

and *that the proposed further diversion would be a violation of the Canadian Boundary Waters Treaty.* He estimates the lowest careful estimate of "injury to American vessels alone at $1,000,000 per year." He disposes of the argument that owing to the fact that the levels of the lakes vary on account of winds and change of barometric pressure by amounts even greater than the reduction, therefore the proposed reduction would be of no consequence. He calls attention to the fact that the demand for this diversion is based solely upon Chicago's needs for sanitation, there being involved in the case no issue of conflicting claims of navigation. According to the Chief of Engineers' report, so far as the needs of a deep waterway from the Great Lakes to the Mississippi are concerned:

> *The maximum amount of water to be diverted from Lake Michigan need actually be not over 1,000 feet per second,*

a conclusion supported by other evidence cited by the Secretary of War. He points out the fact that "from the standpoint of navigation alone in such a waterway too great a diversion of water would be a distinct injury rather than a benefit." He expresses grave doubts as to whether under Sections 9 and 10 of the Act of Congress of 1899 the Secretary of War has any authority or discretion

> to grant a permit which would inflict a substantial injury upon commerce in order to benefit sanitation.

He expresses the opinion that "no further diversion of water should be permitted at Chicago without the direct sanction of the Congress of the United States," saying:

> I do not for one moment minimize the importance of preserving the health of the great City of Chicago; but when a method of doing this is proposed which will materially injure a most important class of the commerce of the Nation and which will also seriously affect the interests of a foreign power, it should not be done without the deliberate consideration and authority of the representatives of the entire Nation. The growth of Chicago is phenomenal and its representatives are quite unwilling to put any final limit to the demand which may be made upon the waters of Lake Michigan for its sanitation under the system now in use. I have before me the report of 1911 of the president of the sanitary district, in which he says:
>
> "I am of the opinion that the presumption that our water supply is to be limited to 10,000 cubic feet per second, or 600,000 cubic feet per minute, is gratuitous and mischievous and should not be voiced by the officials of this district. I believe that we should have the volume requisite to our needs as they appear and are justified."
>
> It is therefore quite conceivable that compliance with their sanitary needs according to this method of sanitation may eventually materially change this great natural watercourse now existing through the lakes.

The considerations involved in the application the Secretary finds to be "broad questions of national policy." He then takes up the question of the sanitary needs of Chicago and expresses an opinion that the amount of water applied for is not necessary to a proper sanitation; at bottom the issue comes down to the question of cost; that there are other adequate systems of sewage disposal which are in use throughout the world including all the other cities on the Great Lakes. He says:

> The evidence before me satisfies me that it would be possible in one of the several ways to at least so purify the sewage of Chicago as to require very much less water for its dilution than is now required by it in its unpurified condition.
>
> * * * * *
>
> It is manifest that so long as the city is permitted to increase the amount of water which it may take from the lakes, there will be a very strong temptation placed upon it to postpone a more scientific and possibly more expensive method of disposing of its sewage. *This is particularly true in view of the fact that by so doing it may still further diminish its expenses by utilizing the water diverted from the lakes for water power at Lockport.* But it must be remembered that for every unit of horsepower realized by this water at Lockport four units of similar horsepower would be produced at Niagara, where the natural conditions are so much more favorable.

The matter of restoration of the lake levels by compensated works is considered by the Secretary. He points out that—

> such compensating works can only be constructed by the authority of Congress and at very considerable cost. It is not a matter which is in the hands of the Secretary of War. * * * Furthermore, in most cases such compensating works could only be constructed with the joint consent of our neighbor Canada,

and consequently disposes of all arguments based upon the Boundary Waters Treaty, considerations of which lead him to the conclusion "that the question is not merely national but international." He states in this regard—

> The establishment by formal treaty between the two countries of a tribunal with jurisdiction to decide just such questions seems to me to afford an additional reason against the assumption of jurisdiction to decide the question by an administrative officer of one of those countries.

In conclusion the Secretary of War sets forth his conclusions as follows:

> First. That the diversion of 10,000 cubic feet per second from Lake Michigan, as applied for in this petition, would substantially interfere with the navigable capacity of the navigable waters in the Great Lakes and their connecting rivers.
>
> Second. That that being so, it would not be appropriate for me, without express congressional sanction, to permit such a diversion,

however clearly demanded by the local interests of the sanitation of Chicago.

Third. That on the facts here presented no such case of local permanent necessity is made evident.

Fourth. That the provisions of the Canadian treaty for settlement by joint commission of "questions or matters of difference" between the United States and Canada offer a further reason why no administrative officer should authorize a further diversion of water manifestly so injurious to Canada against Canadian protest.

The prayer of the petition is therefore denied. (Rec. Vol. VII, p. 7–17.)

After this decision of the Secretary of War, which involves and passes upon substantially every contention now made by the appellant, it came to the attention of the War Department that appellant was diverting from Lake Michigan more water than was authorized by the permits then in force.

On February 24, 1913, acting under instructions from the War Department, the United States Engineer at Chicago wrote to appellant a letter which contained the following:

> I am directed by the War Department to notify you that measurements made by the Engineer Department during January indicate that since the Secretary of War's decision of January 8, 1913, you have been diverting from Lake Michigan more water than the 4,167 second-feet authorized by the existing War Department permits.

Your attention is invited to Section 10 of the Act of March 3, 1899, which is being violated by such diversion, also to the provisions of Sections 12 and 17 of the same act, a marked copy of which is inclosed.

Kindly advise this office what steps, if any, you propose to take to keep future diversions within the limits of the existing War Department permits and how soon such reduction of diversion may be expected.

I have also to inform you that a continuation of the excess diversion may require action by the United States District Attorney. (Rec., Vol. VI, p. 3968.)

On February 27, 1913, the president of the appellant replied to the foregoing letter without complying with its request for information and stating merely that the letter would be taken up at the next meeting of appellant's board of trustees. (Rec., Vol. VI, p. 3969.)

On March 15, 1913, the United States Engineer at Chicago, again acting under instructions from the War Department, wrote a second letter, of the same tenor as the one above quoted. (Rec., Vol. VI, pp. 3969–70.)

Finally, on March 22, 1913, Mr. Adcock, attorney for the appellant (the same who is now appellant's attorney of record on this appeal), wrote at some length to the United States Engineer at Chicago in an attempt to justify appellant's action. In his letter he mentioned the pendency of the Calumet River suit and the defense of appellant that it was acting

under the reserved police power of the State for the preservation of the lives and health of its citizens. He further states:

> You are no doubt aware that the International Waterways Commission by its report of 1907 recommended that no question be raised as to the right of the Sanitary District to flow through its channels for sanitary purposes *at least* 10,000 cubic feet of water per second. (Rec., Vol. VI, p. 3971.)

The inaccuracy of this statement is pointed out elsewhere (*infra*, p. 226), for counsel for appellant make the same misstatement in appellant's brief.

Mr. Adcock's letter proceeded as follows:

> The Board of Trustees of the Sanitary District appreciate their responsibility in the matter. *It is their desire that the rights of the Sanitary District be finally determined.* With this in view, and inasmuch as the suit now pending relating to the Sag Channel involves issues which are somewhat similar to the questions now involved in the interrogatories propounded in your two letters, I respectfully suggest that the bill of complaint in the case of the *United States* v. *Sanitary District* now pending be amended or a supplemental bill filed so that all the issues above referred to may be settled and promptly adjudicated. A great deal of testimony has been already taken, all of which will apply to the issues that would be raised by the proposed amended proceedings. A great deal of time, work, and trouble would be saved by pursuing

> the method I suggest and the Sanitary District will cooperate to speedily make up and try the issues upon the issues which may be presented by the amended or supplemental bill proposed, and will also stipulate that all testimony thus far taken be treated as having been taken in the amended proceeding. (Rec., Vol. VI, pp. 3972–73.)

In spite of this letter, appellant has seen fit to make the contention before this court that the appellee should not have proceeded by bill for injunction and that it was restricted to criminal proceedings against appellant and its officers. *It was by appellant's own request that suit for an injunction was instituted instead of criminal proceedings.*

As a result of the decision of the Secretary of War and of appellant's defiance of it, the Second or Main Channel suit was instituted.

Under our Point VIII (*infra*, p. 255), we shall deal further with the appellant's contention that the United States by acquiescence, laches, or implied authority has estopped itself from asserting its paramount control over navigation in the case of appellant.

III

Evidence as to the quantity of water now being withdrawn by the appellant from Lake Michigan and as to the amount it intends to withdraw in the future if its contentions are upheld

There is no dispute that the appellant is diverting at least 10,000 c. s. f. from Lake Michigan through its various channels. Owing to the fact that the

hearing of testimony on this subject was concluded in 1913, the record does not reveal the exact amount withdrawn since then. That it is at least 10,000 c. s. f., however, is apparent both from the allegations contained in the appellant's motion of July 12, 1920 (Rec. Vol. VIII, p. 152), from the assumed facts taken as the basis for the testimony taken in behalf of the appellant on April 25, 1923, and from admissions in the appellant's brief. This conclusion is supported by the fact that in 1923 the population of appellant's drainage district exceeded 3,142,000 (Rec. Vol. VIII, p. 217), which population would (under Sections 20 and 23 of the Illinois Act of 1889) require a diversion of about 10,500 c. s. f.

In fact, we are warranted in assuming that the appellant is regularly diverting 12,000 c. s. f. The Calumet Sag Canal was not completed until 1922 and from that time on had and has a capacity of 2,000 c. s. f. (to be increased later to 4,000 c. s. f.). According to appellant's admissions in its brief (pp. 13–14) it is at present withdrawing 6,250 c. s. f. through the main channel of the Chicago River, 1,750 c. s. f. through the North Branch of the Chicago River (1,000 at Wilmette and 750 through the Lawrence Avenue conduit), and 2,000 c. s. f. through the 39th Street conduit—a total of 10,000 c. s. f. (Appellant's Narrative, p. 191). That this is the actual truth is confirmed by appellant's frequent reiterations that 10,000 c. s. f. is the amount of the maximum or flood run-off of the Chicago *River* Basin (not the "Chicago River *Drainage* Area" as

appellant states, Appellant's Brief, p. 6—see Appellant's Narrative, p. 189). Incidentally, appellant does not explain how it was able to manage with a diversion of considerably *less* than 10,000 c. s. f. up to and including 1913, nor how it avoids the supposed bad effect of a maximum run-off in the Calumet River Basin, where it amounts to over 15,700 c. s. f. (Appellant's Narrative, p. 520), nor what it does with the trade wastes (from the stockyards and tanneries) entering its canal from the sewers of Chicago, which "require as much water to dilute it as would be necessary to take care of the sewage of a million and a half people" (Appellant's Brief, pp. 78–79).

The average amount of water which was withdrawn by appellant from the opening of the canal until 1913, was, according to appellant's chief engineer, as follows:

	Cubic second feet
1900	4314
1901	4437
1902	4569
1903	5144
1904	5271
1905	5381
1906	6292
1907	6444
1908	6596
1909	6970
1910	7132
1911	7295
1912	7458
1913	7619

(Rec. Vol. III, p. 1618.)

The report of the International Waterways Commission of January 8, 1910, shows that prior to that

time appellant refused to give that Commission information as to the amount of water it was diverting. (Rec. Vol. VII, p. 253.)

As evidence of the amount of water which appellant proposes to divert in the future, we cite the testimony of appellant's witnesses as to the probable future population of Chicago, keeping in mind the Illinois statutory requirement of amount of diversion per 100,000 of population:

	Human	Industrial equivalent	Total	Diversion in c. s. f.
1930	3,710,000	1,700,000	5,410,000	18,083
1940	4,425,000	1,900,000	6,325,000	21,083
1950	5,140,000	2,100,000	7,240,000	24,133
1960	5,800,000	2,300,000	8,100,000	27,300

(Rec. Vol. VIII, 217, Appellant's Narrative, p. 362.)

The magnitude of the proposed withdrawal can be appreciated when compared to the present flow of rivers tributary to the Great Lakes, and of connecting waters between the Great Lakes, as shown under our next subheading.

IV

The effect of the withdrawal of water from Lake Michigan upon the levels of the Great Lakes

(A) Comparison with other waters

For the purpose of convenient comparison we cite from the record evidence as to the mean annual flow of the following streams tributary to Lake Michigan:

	Cubic second-feet
Grand River	4,620
St. Joseph River	3,575
Fox River	3,370

(Rec. Vol. VII, pp. 462–3, 471–2.)

and of the following connecting waters between the Great Lakes:

	Cubic second-feet
St. Marys River	82, 000
Detroit River	204, 200
Niagara River	212, 000
St. Lawrence River (at its head)	254, 400

(Rec. Vol. VII, p. 344.)

The appellant's diversion is, therefore, substantially equivalent to the combined flow of the three principal tributaries to Lake Michigan, and to five per cent of all the water contributed by the Superior, Michigan, Huron and Erie basins.

Even in the absence of testimony directly bearing on the effect of this diversion on the lake levels, this would seem sufficient to constitute such a modification of the condition of navigable waters of the United States as to require the recommendation of the Chief of Engineers and the authorization of the Secretary of War. Likewise, the great increase of waters emptied into the Desplaines and Illinois Rivers constitutes such a modification. *The appellant has created a large navigable river flowing away from the Great Lakes.*

(B) Decision of the Secretary of War on January 8, 1913

On January 8, 1913 the Secretary of War, in rendering his decision denying appellant's application for a permit to divert 10,000 c. s. f., found that the withdrawal of 10,000 c. s. f.—

> would substantially interfere with the navigable capacity of the Great Lakes and their connecting waters. (See supra, p. 58.)

And that such a withdrawal would reduce levels as follows:

	Inches
Lakes Huron and Michigan	6.9
Lake St. Clair	6.0
Lake Erie	5.4
Lake Ontario	4.5
St. Lawrence River and Rapids Plat	4.8+

The Secretary of War further found:

> This reduction would create substantial injury in all of the American harbors of the Great Lakes and in the St. Mary's, St. Clair, and Detroit rivers. It would produce equal injury in Canadian harbors on the Great Lakes, and a still greater injury on the lower St. Lawrence, the Canadian officials claiming a probable lowering effect of 12 inches at Montreal at low water. (Rec. Vol. VII, p. 10–11.)

This finding is entitled to great weight in this case; in fact, we maintain that the appellant will not be heard to contradict it. It was made in a proceeding which the appellant invited by its application for a permit to withdraw 10,000 cubic feet of water per second from Lake Michigan. The Government of Canada was represented at the hearing, and submitted its evidence. The Secretary of War had before him the reports of the Lake Survey and the International Waterways Commission, as well as the conclusions of the Chief of Engineers, whose statutory authority in passing upon the application was, as stated in the finding, concurrent with and independent of that of the Secretary of War. The principal expert witness for the appellant, Gardner S. Williams, upon whose

criticisms of the work of the government engineers the appellant is relying in this case, had commenced his work in the case more than three years prior to the hearing before the Secretary of War. None of his criticisms or conclusions were submitted to the Secretary of War. On the contrary, the Chief Engineer for the Sanitary District (Rec. Vol. VI, p. 3701) expressly stated that he did not wish "*to question the accuracy of the figures or the fairness of the calculations.*" Here was a controversy which involved the relations between this nation and Canada; a controversy in which a finding was to be made as to the right of a foreign government. The appellant presented its case, and upon this vital question of the effect of the diversion of the water on the lake levels it produced no evidence to contradict the conclusions of the government engineers. Having invited the hearing, it permitted the Secretary of War to make a finding upon the assumption that it accepted the correctness of the methods used by the United States engineers.

We submit, therefore, that in this proceeding the appellant will not be heard "to question the accuracy of the figures or the fairness of the calculations" of the Government engineers as to the effect of the withdrawal of water from Lake Michigan upon the levels of the lakes.

The conclusions of the Secretary of War in his report and the contentions of the United States in this case, however, are sustained by the overwhelming weight of the evidence in this record.

17925—24†——6

(C) Official reports as to effect of diversion upon lake levels

Investigations begun in 1895 by a board of engineers appointed by the Secretary of War, carried on in 1898 by the Deep Waterways Commission, and then transferred to the United States Lake Survey in 1899 resulted in extensive observations on the St. Clair, Detroit, Niagara, and St. Lawrence Rivers (Rec. Vol. IV, pp. 2454–2493, 2380; Vol. VII, 253). The result of the work is summarized in the report of the International Waterways Commission, dated January 4, 1907, as follows:

* * * The amounts by which the mean level, as derived from observations of the last 46 years of the various waters will be lowered by a discharge of 10,000 and also by 14,000 cubic feet per second are given in the following table:

Location	Water level lowered by diversion at Chicago of—	
	10,000 cubic feet per second	14,000 cubic feet per second
	Feet	*Feet*
Lake Huron and Michigan	0.52	0.70
Lake St. Clair	.45	.64
Lake Erie	.45	.64
Lake Ontario	.35	.49
St. Lawrence River at Rapids Plat	.40	.57

The length of time required to produce this effect is about 5 years; about half of it will be produced at the end of 18 months. The above figures give the effect at average level; they are much more considerable during low-water periods. (Rec. Vol. IV, p. 2418–19.)

This report is signed (Rec. Vol. IV, p. 2433) by the three representatives from the United States and the three representatives from Canada.

General Ernst and Haskell, the two engineers who represented the United States on the Commission, and Wilson, Secretary of the American Section, testified as witnesses for the appellee in this case.

Subsequent to the report of the International Waterways Commission additional observations with reference to the Niagara river were made in 1907 and 1908. (Rec. Vol. II, p. 848.) Those observations check almost exactly with the measurements which had been made in 1899. (Rec. Vol. I, p. 254.) Additional observations were made for the St. Clair river in 1909. (Rec. Vol. I, p. 291.) On January 8, 1910, the International Waterways Commission made another report, in which were set forth its findings as to discharge *increments* of the river outlets of the Great Lakes System. (See Rec. Vol. VII, p. 294–5.)

According to this table (the increment being the difference in discharge corresponding to a difference in lake level of 1 foot) the withdrawal of 10,000 cubic feet of water per second from the lake produces a lowering of the level of Lakes Michigan and Huron of from *5.8 to 7.4 inches;* of Lake St. Clair of from 5.9 to 6.5 inches; of Lake Erie of from 4.8 to 6.1 inches; and of Lake Ontario of from 4 to 4.5 inches. The lowering effect of the withdrawal changes with the elevation of the lakes; a given withdrawal produces a larger effect at times of low water than at times of high water. A consideration of this fact explains the

difference in the increments which have been deduced from different series of observations.

There is, also, in the record the statement of the Canadian representatives as to the effect of the withdrawal upon the levels of the Canadian waters. This statement sets forth their conclusions with respect to levels as follows:

Lake	Actual diversion	Loss of level, assumed diversion of—	
		10,000 c. s. f.	14,000 c. s. f.
	Inches	*Inches*	*Inches*
Michigan-Huron	3.07	7.4	10.3
Erie	2.6	6.1	8.6
Ontario	1.9	4.5	6.3
Rapids Plat	2.8	6.8	9.8
Cornwall Canal	2.1	5.0	6.9
Coteau	2.2	5.4	7.6
Montreal	4.3	10.25	14.4
Lanoraie	2.2	5.4	7.6
Sorel	2.5	6.0	8.4

(Rec. Vol. VI, pp. 3639-3640.)

The facts with reference to this diversion are established by evidence as strong as can be produced in support of any engineering proposition.

This conclusion as to the effect of the diversion of water from Lake Michigan upon the lake levels has been so generally accepted by engineers that it has not been looked upon as a matter which was open to debate. While the statement as to the result has changed slightly as new observations and computations have been made, the range is a very narrow one, and the latest figures agree substantially with the earlier computations of the Government engineers. An excellent statement of the principle involved is

found in the report of Maj. Keller, dated August 13, 1903 (Rec. Vol. IV, p. 2603), as follows:

> It seems hardly necessary to prove that if unaccompanied by works which will diminish the flow in the natural outlet, an artificial diversion caused by creating a new outlet for any body of water must lower its level below that which would have existed in the absence of the artificial outlet and diversion and that the amount of such lowering will depend upon the size of the new outlet and the volume thus diverted. Certainly the asserted lowering would hardly be questioned were the diversion at Chicago of volume, for instance, equal to that of the natural discharge at Port Huron. Familiar examples in proof of this might readily be multiplied, but one will suffice: Consider the case of a trough or fountain basin which receives a constant supply of water and from which the waste flows through a rectangular notch or cut in the rim, the maximum discharge capacity of the notch being slightly greater than the constant volume of water flowing into the trough or basin. As a result of the excess discharge capacity of the notch, the basin will never fill flush to the rim, but will reach and maintain some level of equilibrium slightly below the top, and the waste will then equal the constant supply. If now the size or cross section of the outlet is increased either by widening the first notch or by adding another one elsewhere in the rim, the volume of water outflowing will at once be increased and will then temporarily exceed the supply. The surface level

> of the basin will therefore fall until it is so low as once more to bring supply and waste into equilibrium. It is plain that the difference between the new level of the basin and its former elevation is due to the additional notch and is dependent on its size or cross section. The same effects will follow even if the supply is variable, but it will, of course, be more difficult to demonstrate them directly.

See also the report of the Board of Engineers for Rivers and Harbors, of December 16, 1913. (Rec. Vol. IV, p. 2581.)

(D) Evidence sustaining the official reports

The official reports of the United States are sustained in this case by evidence of the highest order.

The expert witnesses for the United States, so far as the testimony deals with matters of an engineering nature, were men of recognized distinction in the engineering profession, or men who, by reason of specialized training in river hydraulics and hydrography were uniquely qualified adequately to solve the questions involved in this case.

We shall not take the time of this Court to set forth the qualifications and experience of these witnesses. An unsatisfactory and incomplete summary is contained in Appellant's Narrative (pp. 126–131), while the qualifications of appellant's witnesses are treated very elaborately. A full account will be found in the portions of the record there referred to.

That the diversion of water at Chicago in the Drainage Canal lowers the Great Lakes system from the foot of the rapids in St. Marys River to some point in the lower St. Lawrence River was not questioned by the engineering experts produced on behalf of the appellant, and there appears no serious questioning of this fact by the appellant in any of the evidence. The controversy is as to the measure of this lowering for a specific volume of diversion. The difference in the conclusions as to the measure of the lowering in the four Great Lakes concerned is as follows:

	Secretary of War, Jan. 8, 1913	Best evidence of appellee	Williams, appellant's witness principal
Lakes Michigan and Huron:	*Inches*	*Inches*	*Inches*
10,000 c. s. f.	6.9	6.0	4.1
14,000 c. s. f.	9.6	8.4	5.7
Lake Erie:			
10,000 c. s. f.	5.4	5.5	3.5
14,000 c. s. f.	7.6	7.7	4.9
Lake Ontario:			
10,000 c. s. f.	4.5	5.0	4.0
14,000 c. s. f.	6.3	7.0	5.6

It appears from these figures that for a diversion of 10,000 c. s. f., Mr. Williams' conclusions were that the lowerings would be substantially *two* inches less for Lakes Michigan-Huron and Erie and *one* inch less for Lake Ontario than the determination of the lowering by the United States Engineers. The controversy, then, is as to the correctness of the conclusions of the Secretary of War and the Government Engineers on the one hand, and those of the only witness for the appellant, who made an analysis of the data of the Government Engineers and reached conclusions

of his own. It should be added that Mr. Williams, in his conclusions, has the partial endorsement of appellant's witnesses, Frederic P. Stearns and John R. Freeman, and of vague generalizations by Lyman E. Cooley. In the analysis of the testimony, however, it will appear that the corroboration of these two engineers, well known in the profession, is of a superficial character, without adequate study of the data.

Appellant's expert testimony in the hydraulic phase of the case is mainly that of a single engineer.

The qualifications of this one engineer to criticize the many expert witnesses of the appellee will not bear close scrutiny. His conclusions were of a partisan character, determined for no other purpose than to contribute to the defense in this case. His failures on previous occasions in attempting to measure the flow of the American channel of the Detroit River, and to conduct discharge measurements on the St. Mary's River do not indicate either experience or expert knowledge. (Rec. Vol. II, pp. 769-780.)

An interesting sidelight is thrown upon Mr. Williams' testimony by the fact that he was a witness for the State of Missouri in the suit brought in this Court against the State of Illinois and appellant to restrain the drainage of sewage into the Illinois and Mississippi Rivers by appellant (200 U. S. 496). In that case Mr. Williams testified to the appalling effects which appellant's diversion and discharge of sewage at Chicago would have on the citizens of

Missouri. Mr. Williams testified, among other things, to the following:

> The danger impending over the citizens of Missouri as the result of the discharge of the sewage of Chicago through the Drainage Canal into the waters of the Illinois River is a most fearful menace to the life and welfare, not only of the citizens of Missouri but of the citizens of other cities below the mouth of the Illinois River, leaving entirely out of consideration the question of typhoid fever. (Rec., Vol. II, p. 763.)

Mr. Williams was of the opinion that—

> there would be great danger of the occurrence of an epidemic of anthrax, not only among the human inhabitants of the State of Missouri but also among the lower animals using the water. (Rec., Vol. II, p. 763.)

and that glanders and other vicious diseases would probably attack the inhabitants of the plaintiff State. Mr. Williams was so positive of his conclusions that he stated that it was—

> almost a certainty that the germs of the disease would be communicated or transmitted to the water supply of the City of St. Louis and the consumers thereof (Rec., Vol. II, p. 765).

And that—

> it would undoubtedly lead to an outbreak of Asiatic cholera in the City of St. Louis. (Rec., Vol. II, p. 765.)

See also further portions of his testimony. (Rec., Vol. II, pp. 766–768.)

Mr. Williams' information on the condition of the Niagara River at the International Bridge Section was the result of observations made from the car window while passing across the bridge on a railroad train. (Rec., Vol. II, p. 915.) His experience was almost exclusively with the measurement of very small streams. (Rec., Vol. II, pp. 781–782.)

Mr. Williams also served as an expert witness against the United States in the case in which the United States sought the condemnation of the water power at Sault Ste. Marie, the case of *United States* v. *Chandler-Dunbar Water Power Company*, 229 U. S. 53. It appears further that when Mr. Williams needed to have some discharge measurements made in the St. Lawrence River in connection with a water-power project he employed a Mr. Blanchard, who was assistant to Mr. Sabin on the St. Clair River, and who was in charge of the discharge measurements of the Detroit River, both under the United States Lake Survey.

The object of the hydraulic measurements on the Great Lakes, begun in 1898, had no bearing whatever on any controversy that might arise regarding the depletion of the Great Lakes system by reason of the diversions at Chicago.

An appreciation of the care in which the appellee's observations were made, of the effort and expense devoted to ascertaining the truth, and of the improbability of any material error can be appreciated only by a review of technical evidence to an extent that would be out of place in this brief. Little idea

of the processes of river measurement and of the inapplicability and shallowness of the appellant's criticisms of the methods employed by appellee's experts can be gained without an elaborate study of their testimony. (See particularly the testimony of Mr. Shenehon.)

Appellant, in criticizing the conclusions reached by appellee's witnesses, lays particular stress upon its claim that appellee's witnesses erred in assuming that a certain stage (or level) of the Lake at an estimated number of minutes before the time the discharge measurement was made was the stage that controlled the particular discharge at the time the measurement was made. (Appellant's brief, pp. 65–66.) In advancing this criticism, appellant's witness (and counsel for appellant) assumed that all ascending stages of the Lake were high stages and that all descending stages were low stages. The increment resulting from a low stage of the Lake was found to be less than the increment from a high stage; translated in terms of effect on the lake levels, a diversion of 10,000 c. s. f. results in a greater lowering when the lake is at a low stage than when it is at a high stage.

Appellant's assumption is without basis in the record or in fact. There are as many ascending stages of the lake at low elevations as there are descending stages; the same is true as to high elevations. For instance, if measurements happened to be taken when the elevation of the lake is rising

even though it be approaching its highest point, and if, as appellant claims, appellee's witnesses were in error as to the time taken for the effect of the elevation to reach the measuring section, the discharge measurements would be too low. On the other hand, after the climax is reached and the elevation is going down, the discharge measurements at high elevations would, according to appellant, be too high. There were several hundred discharge measurements made. Just as many were made during descending stages as ascending stages, and any possible error pointed out by appellant is compensated by the opposite error at other times.

Appellant's brief (p. 66) also contains a very confusing and misleading statement as to assumptions made by appellee's witnesses with respect to the time in which the flow in appellant's canal would be changed throughout from 4,167 c. s. f. to 10,000 c. s. f. Two of the appellee's experts (Ray and Moore) made estimates as to this length of time. Appellant attempted to refute their testimony by tests made; and these tests permitted certain definite conclusions. One of these is that the appellant was attempting to create a flow of 10,000 c. s. f. through the full length of the canal by discharging 9,000 c. s. f., or a little more, at Lockport. Under these circumstances, it is not surprising that a long period of time was required to establish a flow of 10,000 c. s. f. (Rec., Vol. VI, pp. 3447–48, 3505; Rec., Vol. VII, pp. 789, 92.)

The inapplicability of appellant's canal test to the rivers of the Great Lakes may be seen at a glance from the following comparison:

First, the change in flow in the Niagara River, for example, is caused by relatively small change in the lake at the *head* of the river. A hundred or more measurements were made when the water did not rise or fall more than two inches in an hour, and this meant a change of only about two per cent in the flow (Rec. Vol. II, pp. 848–51; Vol. VII, pp. 149–53.)

Second, the change of flow in appellant's canal was caused by sudden opening of gates at *the foot of the canal*, and the almost instantaneous change was from 4,000 to 9,000 c. s. f. or more. This was a change more than sixty times greater than the change in the river flow.

Mr. Shenehon's discussion of reservoir effect in the Niagara River indicates that the appellant's experts were fully cognizant of the hydraulic principles involved in variations of flow. (Rec. Vol. V, pp. 3172–76.)

In fact, these experiments made by appellant in its canal do not in any way disprove the determinations of the appellee's engineers. When the gates at appellant's power house at Lockport were open to the capacity of 9,000 to 10,000 c. s. f., it had to draw off a quantity of water from the storage in the forebay of the power house and canal. If the amount of the storage is taken into consideration, it will be found that the change of flow at various places along the canal up the canal from the power house travels

approximately at the rate determined by the Government engineers. Appellant's stress is laid upon the fact that it takes a much longer time to secure a uniform flowage throughout the entire canal of the full amount of water for which an opening is made at the power house. We must, however, take into consideration the source of supply of the water.

In Lake Erie, for example, at the mouth of the Niagara River, if there is an increment in the elevation it immediately moves down the Niagara River to the International Bridge and the flow is increased correspondingly directly to the elevation. In the case of appellant's canal, however, the effect of the opening (the lag, as it is called in this case) must travel back through the canal over thirty miles to Lake Michigan and then the water from Lake Michigan must travel down the canal again in order to secure a uniform flow of the increased amount. The Chicago River is filled with slips between its various docks. The storage in these slips must be drawn down in order to increase the slope from the river to Lake Michigan. In the meantime Lake Michigan itself may have fallen, and this would tend to retard the flow from Lake Michigan through the Chicago River and canal. In the Niagara River, on the other hand, there is but one factor involved—that is, the elevation of Lake Erie at Buffalo. The change in volume corresponds directly to that change in elevation.

(E) The effect of the appellant's diversion of water from Lake Michigan is a substantial interference with the navigable capacity of the Great Lakes

In addition to the finding of the Secretary of War in his decision of January 8, 1913, in which the Chief of Engineers concurred (Rec. Vol. VII, p. 10), there is considerable evidence of the important results of each variation of an inch in the lake levels. For example, in the report of the International Waterways Commission, dated January 8, 1910, it is stated:

> The traffic which passed through the Detroit River, its busiest link, in 1907, amounted to 71,226,895 tons, valued at about $700,000,000. About 70 per cent of this traffic is carried in large freight carriers which are loaded down to the greatest draft that can be carried into the harbors or through the channels between the lakes. With the depth now available they are usually loaded to a draft of about 19 feet, but careful watch is kept upon the stage of the waterways and advantage is taken of any temporary increase of stage to load the vessels deeper. The number of deep-draft vessels, as well as their size, and the share of lake traffic which they carry is increasing each year, while the lake traffic itself is increasing with great rapidity. Vessels which would carry an additional load of 85 tons for each inch of additional draft have recently been added to the fleet. Every inch added to the available depth of water would, therefore, be of material benefit to commerce. (Rec., Vol. VII, pp. 248–9.)

In the proceedings before the Secretary of War the representatives of the Canadian Government made clear the substantial nature of the effect produced by the diversion of this amount of water as follows:

> That these seemingly small changes are important and divert traffic may be seen from the fact that in 1905, when the water in Lake Huron reached a minimum of 580.66 during the season of navigation and had a mean level for the year 580.95, there passed east through the American canals at the Soo 32,632,268 net tons and through the Canadian canal only 4,146,740 net tons. Practically all the large carriers with grain, iron ore, flour, and wheat passed through the United States canals.
>
> In 1910 when the water in Lake Huron reached a minimum of 579.51 during the season of navigation and had a mean level of only 580.15 the Canadian canal with its three inches more water carried the bulk of the heavy freight east and passed nearly all the large carriers, the figures being Canadian canal, 31,531,036 tons, and United States canals, 15,602,673 tons.
>
> That is to say, that, with plenty water (19.89 feet to 20.78 feet in the Poe lock), the Canadian lock passed only 11.3 per cent of the freight, but, with low water (18.08 to 18.73 feet in the same lock), the extra three inches in the Canadian lock increased these figures to 67 per cent. (Rec. Vol. VI, p. 3643.)

The importance of one inch of depth at the critical points of navigation is shown by the large amounts which have been expended by the Government in increasing those depths a few feet. In Vol. I of the report of the Chief of Engineers for 1893, p. 533, there is a résumé of the projects for improving the depths of the channels at the critical points prior to that time; and in the record in this case there appears (Vol. VI, p. 3624–3625) a summary showing that almost $100,000,000 had been spent prior to June 30, 1911, in improving the harbors and channels of the Great Lakes.

The principal points at which each inch of lowering produces a substantial effect are given by Mr. Shenehon (Rec., Vol. I, p. 320) as follows:

> The floor of the Poe lock is one of the critical points at the present time. The north end of Lake Michigan is an intricate place for navigation, with a good many shoals. And when a shoal is two inches nearer the surface by the lowering of the lake level, it becomes more of a menace. The vessels, in thick weather sometimes get astray, and loss of draught on a shoal may mean a very serious thing to a vessel. The Manitou Passage in Lake Michigan is a place of the same kind; Gray's reef passage, Sturgeon Bay canal, is a critical point, and the entrance to Green Bay is a place where a vessel is likely to get into trouble. The foot of Lake Huron approaching the St. Clair river is another place; also Lake St. Clair; the foot of the Detroit River and Bar Point, which is just beyond the Detroit

> River, and the west end of Lake Erie; and more particularly that part of Lake Erie leading toward Toledo. The west end of Lake Erie is shallow. When the new lock is built at the Sault, giving greater drafts, the Poe lock will cease to be a critical point; and when the Livingston channel is built in the main Detroit River that will cease to be a critical point. But these others remain; these are fixed and that is what I mean by saying that the points that are critical at the present time, after improvements have been made permitting deeper navigation, those that are safely passed over now, two inches of lowering will reduce their efficiency. (Rec. Vol. I, p. 320–321.)

The appellant, however, asserts that this lowering is not to be regarded as a substantial one for the reasons: (1) That the lake levels vary from other causes more than from the effect of the proposed diversion; (2) because lake levels subsequent to the opening of the Drainage Canal were actually higher than they were prior to 1900; (3) because the United States itself has, by improvements in the Detroit and St. Clair Rivers, increased their discharging capacity, and therefore lowered the levels of Lakes Michigan and Huron by from 6 inches to 1 foot.

The first of these contentions is amply disposed of by the Secretary of War's decision and the report of the International Waterways Commission of January 4, 1907:

> The oscillations will remain the same as before, but low water will fall lower and high

> water will rise less high. The average draft of vessels must be diminished by the amount that the average level is lowered unless the depth be restored by remedial works. (Rec. Vol. IV, p. 2420).

See also the testimony of Major Keller (Rec. Vol. IV, p. 2608) and the statement of the representatives of the Canadian Government in the hearing before the Secretary of War (Rec. VI, p. 3640).

Appellant's second argument, that the lake levels were higher after the opening of the canal than they were before, is effectively answered by its own witness, Mr. Williams (Rec. Vol. II, p. 755):

> Q. What inference, as an engineer, is it your intention that the court at the hearing of this case shall draw from your table number LXV so far as it throws light upon the question of fact which is involved in this case?
>
> A. That the lakes are actually higher now than they were before the diversion. That is all.
>
> Q. *In your opinion does it throw any light at all upon the question of fact as to the effect of diversion?*
>
> A. *None whatever.*

As a matter of fact, however, appellant's statement is misleading. The lake levels, averaged over a period from 1861 to 1900, were higher *by six inches* than the average for the period from 1900 to 1910. (Rec. Vol. VII, p. 759.) Reference to the charts on the subject in appellant's narrative (opposite p. 220) will show a considerable lowering after 1910. Fur-

thermore, appellant was not withdrawing 10,000 c. s. f. during this period; the amount increased gradually from 4,314 c. s. f. in 1900 to 7,619 c. s. f. in 1913.

As to third of appellant's arguments, namely, that by the improvements in the Detroit and St. Clair Rivers their discharging capacity had been increased and therefore the level of Lakes Michigan and Huron had been lowered, the evidence of the appellee's engineers showed that the deposit of material in one part of the river had compensated for dredging in other parts. (Rec. Vol. V, p. 3005, 3334, 2844.)

This dredging, however, even if it had all the effect which is claimed for it by the appellant, was done by the United States in the improvement of navigation. It was part of a general project, and may have been deemed wise in the long run, even if there were some lowering of lake levels. Certainly, in the face of the express statements of the government engineers, it furnishes no argument that a lowering such as that which will be produced by the diversion of the water at Chicago is not to be looked upon as a substantial one.

An example of the inaccuracy with which counsel for appellant has prepared this portion of their case for presentation to this Court is found in such statements as the following (Appellant's Brief, p. 67):

> The unimportance of a few inches is shown by the failure of the appellee to remove a platform over the floor of the Poe Lock,

> which reduced the available depth of the Poe Lock approximately 0.33 of a foot, or about 4 inches. This condition existed from the time it was available for navigation in 1898 to 1913, when Mr. Ripley testified as to such condition. (Appellant's Narrative, p. 154.)

Both the above statement and the summary of Ripley's testimony in Appellant's Narrative seek to give the impression that Ripley was testifying from personal knowledge. As a matter of fact, Ripley was testifying from a *plan* of the lock.

Whatever the plan may have been, the platform was *not* built four inches or any other amount above the lock. This is clear from the testimony of appellee's witness De Young and the survey to which he testified. (Rec. Vol. VI, pp. 3977–78.) Curiously, not only is there no mention of De Young's name in Appellant's Narrative, index or otherwise, but his name is not even included in appellant's elaborate index of the record. (Vol. A.) There is no excuse for counsel's misstatement.

Another example is the following statement (appellant's Brief, pp. 67–68):

> The reference plane for the navigation improvement project of 1903, of the critical points of navigation between Lake Superior and Erie ports provided for by Congress, was fixed by the Engineer Corps *six inches lower* because of the diversion of 10,000 second-feet at Chicago. (Appellant's Narrative, p. 155.) In other words, these critical points of naviga-

> tion were dredged and deepened six inches lower than they would have been had the Chicago diversion not existed, and navigation was thus protected from the claimed effects of the Chicago diversion.

Reference to the record discloses that in the 1903 project the improvements were referenced to an assumed water surface of 4.0 lower in one case and 2.7 in the other. (Rec. Vol. III, p. 1298.)

V

The injury to navigation resulting from the lowering of the Lakes

We have already called attention to the findings of the Secretary of War on January 8, 1913, in this regard.

> The lowest careful estimate of injury to American vessels alone is reported by the Chief of Engineers at $1,000,000 per year. (Rec. Vol. VII p. 11.)

This finding of the Secretary of War is supported by the report of the International Waterways Commission of December 1, 1907 (Rec. Vol. IV, p. 2420–2421), and by the evidence of the witnesses for the United States in this case.

In fact, the extent of the injury to commerce which will be inflicted by this lowering of lake levels has never been seriously questioned. In the final report by the Board of Engineers on Waterways from Lockport, Illinois, to the mouth of the Illinois River, dated August 15, 1913, the members of that Board unite in the following statement:

> The largest lake freighters recently built carry over 80 short tons of freight for each inch of loaded draft, and an uncompensated Chicago diversion of 10,000 second-feet would cause a loss to each vessel of at least 446 tons in carrying capacity for each down trip through the channels connecting with Lakes Michigan and Huron. This, based upon 25 trips per season, with vessels returning light, means a loss of at least 11,150 tons per year, and at a freight rate of 55 cents per ton represents a monetary loss of at least $6,000 per large vessel per year. During the season of 1912 there passed through the locks at Sault Ste. Marie over 72,000,000 tons of freight, the greater part of which was carried in vessels of such size as to be affected by any loss of depth caused by a Chicago diversion. The tonnage of 1913 bids fair to exceed the tonnage of 1912. The lowest estimate of the loss to American vessels alone that has been brought to the attention of the Board is over $1,000,000 per annum, and the loss will increase with the increase in the number and size of vessels. (Rec. Vol. IV, p. 2587.)

In this connection should also be considered the statement of the representatives of the Canadian Government in the hearing before the Secretary of War. (Rec. Vol. VI, pp. 3644–3645.) The figures presented by them show with respect to Canadian vessels—

> a total loss per annum of $281,628 to the lake freighters in freight charges alone

in addition to the loss resulting from the building of boats designed for certain depths in reliance upon a maintenance of those depths. They state further:

> The damage accomplished by the lowering of the lakes and St. Lawrence levels can not be computed and shown simply by the loss of carrying capacity in tonnage for vessels. There is more to consider; the loss to the public at large in delaying cheaper rates; the loss to the country in rendering all harbour and channel improvements more costly and retarding their completion. (Rec. Vol. VI, pp. 3644–3645.)

The Shipping Federation of Canada, in its statement before the Secretary of War, reached substantially the same conclusions, finding a loss to Canadian vessels of $273,093 in freight per season. It states also that at least one-half of the trans-Atlantic steamers, etc., would be affected in trading at Montreal, to the extent of ten inches in draught, as would also be affected the deep-draught colliers of the Dominion Coal Co., and, as a result, there would be an additional loss of $322,675 per season. It calls attention to the

> fact that a very large number of steamers at present using the St. Lawrence route have been especially designed and built for that trade, relying on the minimum depth of the present channel which is availed of by shipowners to the last inch. (Rec. Vol. VI, pp. 3678.)

Analysis of evidence as to effect of lowering on navigation

(1) In speaking of the lowering of the surface levels of the Great Lakes and the connecting waterways, or loss of depth in these, it is understood that this lowering is referred to the surface levels which would exist in the absence of the diversion in the Chicago Drainage Canal which causes these lowerings. A lake, as Michigan, for instance, may be actually higher for a series of years following the opening of the Drainage Canal. The variation in the rainfall, the run-off, and the evaporation from these basins is such that the surface levels change from season to season and from year to year. We have periods of high water and periods of low water, and a period of ample supply with its tendency to higher levels may mask for a time the lowering effect caused by the diversion. See testimony of Wheeler (Rec. Vol. I, p. 91) and Shenehon (Rec. Vol. I, p. 286).

(2) Assuming for illustrative purposes a lowering of five inches for a diversion of 10,000 cubic second-feet in the Drainage Canal, the loss in load for draught of 19 feet 7 inches instead of 20 feet, of one of the big lake freighters is, for each inch, from 80 to 88 tons of 2,000 pounds, or 400 to 444 tons for 5 inches loss of draught. The loss in tonnage for losses in draught as computed by appellee's witness, Dr. Sadler (Vol. III, p. 1245), gives substantially the same result. See also the testimony on this question of Noble, Ernst, Townsend, Wheeler, Sabin, Livingstone, Kel-

ler, Shenehon, and Coulby. (Rec. Vol. I, pp. 15–16, 64, 77, 118, 180, 203, 246, 320, and 430.)

(3) For the large type of lake freighters whose loss of carrying capacity is 400 tons for a loss of 5 inches in draught, the annual loss depends on the number of loads carried during the season. Taking twenty round trips as a basis, and considering the upbound trips as light or partial loads, but the down bound trips as loaded to the limit of navigable depths, the loss of freight for the year for such a vessel is 8,000 tons. Some considerable range in the actual number of trips made appears from the testimony; see testimony of Livingstone, Coulby, Sabin, Wheeler and Adams. (Rec. Vol. I, pp. 203–205, 430–440, 443, 181, 118, and Vol. III, pp. 1372–3.) The testimony leads inevitably, we believe, to the conclusion that twenty round trips is a conservative number as a basis for computing the measure of damage to commerce. The inclusion of small craft in Professor Adams' figures accounts or his low estimate of the number of trips (11.6).

(4) The measure of annual damage based on an assumed loss of draught varied from the figures testified to by appellant's witness, Dr. Sadler (Appellant's Narrative, p. 159; Appellant's Brief, p. 68) to considerably higher figures established by the testimony of the appellee's witnesses, Wheeler, Livingstone and Coulby. (Rec. Vol. I, pp. 118, 207, 481.) Wheeler estimated the annual loss at $227,230 for each inch of draught loss; Livingstone, $500,000 and Coulby

(testifying merely to the loss of his fleet of 61 vessels), $48,800.

While the maximum losses of carrying capacity are borne by the biggest vessels, mention at least should be made of the damage to a great fleet of smaller steamers and sailing vessels trading in the shallower ports.

(5) The above estimates of damage are based on the conditions for one of the years 1907, 1912 and 1913. In 1907, the commerce passing through the Soo Locks was 58,217,214 tons, and in 1913, it was 79,718,344 tons. an increase of 37 per cent in six years. In ten years, 1903 to 1913, the commerce increased from 34,674,437 to 79,718,344 tons, an increase of 117 per cent. In the 20-year period, 1893 to 1913, the commerce increased 638 per cent, so that the commerce of the latter year is more than seven-fold that of the former year. (Statistical report of commerce 1913, p. 11, Rec. Vol. VI, p. 3600.)

The record does not reveal the increase from 1913 to 1924.

(6) The abstraction of a great volume of water from the Great Lakes system by the diversion at Chicago entails great losses in the water power capacity of the Niagara and St. Lawrence rivers. At Niagara Falls alone, 10,000 cubic second feet is equivalent when developed with the highest efficiency to 280,000 horse power. (Rec. Vol. 1, p. 314.) On the St. Lawrence River, in the Long Sault Rapids alone the loss is 45,000 horse power. (Rec. Vol. I,

pp. 314–15–33.) The losses to the Canadians in the depletion of the volume of flow of the Cedar, Cascade, Split Rock, Coteau and Lachine Rapids has not been estimated, but is a very considerable figure. Assuming a gross annual rental of $10 per horse power on on the turbine shaft at Niagara Falls, the annual aggregate rental amounts to $2,800,000, and half this amount capitalized at ten per cent, is $14,000,000. The annual rental value of an electrical horse power at Niagara Falls is stated by appellee's witness F. G. Ray, at $18 per year. (Rec. Vol. V, p. 2814, 2849–50.)

While it is recognized that the water diverted in the Chicago Drainage Canal will augment the water powers at Lockport, and on the Des Plaines and Illinois rivers, these powers are insignificant and petty in comparison with the great developments in the Niagara River.

(7) The lowering of the surface levels of the waters of the Great Lakes from the ship docks at Sault Ste. Marie to the Gulf of St. Lawrence does entail a loss of draught in that class of lake vessels carrying the greater percentage of freight. The draughts to which these vessels are loaded crowds the limit of draught in the navigable channels. In support of this statement we cite the testimony of appellee's witnesses, Noble, Ernst, Townsend, Sabin, Livingstone, Keller, and Ray, and appellant's witness, Ripley. (Rec. Vol. I, pp. 15, 26, 63, 76–77, 179, 180, 185, 201, 246–7, 248, 280; Vol. III, 1318, 1343–44.)

(8) While the damage to commerce due to lower surface levels caused by the diversion at Chicago is already great, this damage will be aggravated when the present through routes of vessel travel are developed for larger, deeper draught vessels; or the cost of this development will be greatly increased by the extra five or six inches of earth or rock excavation required to secure the same draught with lowered lake and river surface levels.

As illustrative of the measure of this increased cost, assume an artificial channel 300 feet wide at bottom and a mile in length. For six inches extra depth, the increase in excavation is 29,333 cubic yards. Estimating the cost of this excavation at $2 per yard (Rec. Vol. III, p. 1319) the cost is $58,666 per mile.

The cost of excavation for six inches required by lower surface levels for navigation on draughts of 25 feet or 30 feet because of the larger areas involved will be much in excess of the cost of excavation to make 20 and 21 foot navigation available, assuming the same lowered lake surface levels.

Deep draught navigation on the Great Lakes is not speculative, but certain. See testimony of appellee's witnesses, Ray and Noble (Rec. Vol. V, p. 2809; Vol. I, p. 3), and of appellant's witnesses, Cooley and Ripley (Rec. Vol. III, pp. 1706–7, 1818–19).

The first passage through the Soo locks of a vessel over 500 feet in length was in 1904. In

1913, 170 vessels ranging in length from 510 to 617 feet passed the Soo locks, and these vessels carried 52 per cent of the freight through these locks, or 41,400,000 tons. Statistical Report of Commerce, 1913. See also testimony of Dr. Sadler. (Vol. III, pp. 1253 et seq.) As an illustration of the growth and the present needs of draught for ocean traffic, the depth of the Panama Canal's depth recommended was 40–40½ feet. (Rec. Vol. III, p. 1317.) Appellant's witness, Sadler, assuming that business on the lakes should increase at the same rate during the next 24 years that it had during the preceding 24 years, estimated the damage done by the loss of three inches draught at $30,000,000.

(9) Not only have the lengths of vessels increased, but the larger types have been built for, or are capable of loading to, draughts of from 21 to 25 feet. See testimony of appellee's witnesses, Wheeler, Sabin, Livingstone, and Coulby (Rec. Vol. I, pp. 118–119, 179, 207–208, 209, 431, 436) and appellant's witness Sadler (Rec. Vol. III, pp. 1251–52).

(10) The surfaces of the lakes are subject to certain fluctuations due to seasonal changes, and certain oscillation due to barometric inequalities and wind. Some testimony on the part of the appellant purported to show that a lowering of a few inches due to the lake diversion will, for this reason, be insignificant and cause no substantial injury to commerce. (Rec. Vol. III, p. 1776.) The fallacy of this suggestion, which appears obvious, was clearly estab-

lished by the testimony. We quote from the testimony of appellee's witness Shenehon:

> Whatever the water level is, if it had been lowered, say two inches, by a diversion, you would still be short your two inches where you needed it, in the critical places. The natural fluctuations due to winds and to seasonal conditions are independent of the Drainage Canal, and the loss in draft is always measured by the amount of the lowering; you are always two inches closer to the bottom in such a case, whether the lake is raised or whether the lake is tilted up or not; you are always two inches closer to the bottom than you would be otherwise; and when you are running over critical areas two inches may count. Perhaps I should say: When you are attempting to run over critical areas. (Rec., Vol. I, p. 320.)

See also the testimony of appellee's witnesses Ernst, Wheeler, and Coulby. (Rec. Vol. I, pp. 64, 70, 71, 116, 180, 444–445.) See also the portions of the report of the International Waterways Commission, quoted by General Ernst:

> The oscillations will remain the same as before, but low water will fall lower and high water will rise less high. The average draft of vessels must be diminished by the amount that the average level is lowered unless the depth be restored by remedial works.
>
> A permanent average lowering of six inches in the lake's level therefore is not easily observable, and will probably not be noticed by navigators.

(11) It is good practice to improve channels and waterways so as to allow some clearance below the keel of the vessel. In rivers or protected channels where waves are not large in times of storm, this clearance is needed in order to allow for the squat or settling of a vessel when running at high speeds. If this clearance is not available, a loss of speed to the vessel is the result. In waterways exposed to wave action an additional clearance is needed to care for the surging of the vessel in a sea. Whatever clearance in these waterways is desirable, it is obvious that the lowering of the surface levels by the diversion at Chicago lessens the effective value of this clearance, and that channels and waterways of this character are damaged to this extent. Assuming a lowering of six inches due to the diversion at Chicago, it becomes apparent that where under the condition of no diversion a foot existed between the keels of vessels, but half a foot remains after the effects of the diversion have been accomplished. Considerable testimony along this line has been incorporated by the appellant, which purports to show that since this clearance is desirable, the effect of the lowering is of small moment. No controversy exists as to this clearance being good practice. It does not follow, however, that any large clearance of this kind is desirable or necessary on the floor of a ship lock such as that at Sault Ste. Marie, and the evidence is conclusive that no such clearance has existed in the critical improved channels in the lower Detroit River. The absence of

this clearance in the Detroit River has compelled vessels to run at slow speed.

(12) The lessened depth due to the lowering of the surface levels of the waters of the Great Lakes system by reason of the diversion at Chicago creates an obstruction to navigation wherever the mean depths are at present 20 feet or less, and having in mind future navigation, wherever the depths are 30 feet or less, and this obstruction exists in every bay, harbor, and inlet of these lakes including the terminal chambers at the entrance to ship locks. It creates an obstruction to navigation also in the St. Marys river from the ship locks, and including the ship locks; in the St. Clair, Detroit, Niagara, and St. Lawrence Rivers wherever the depths are within the limitation stated above. Places where the depths are close to the present limits of navigation, 19 to 20 feet, have been particularly spoken of in the testimony as critical areas. As the effect of this surface lowering is to limit the navigable areas of the Great Lakes and to change the sailing courses of the through freighters and make them longer, the lowering is an obstruction to navigation and a damage to the commerce of the Great Lakes. The limitation of the available sailing courses for the vessels of the Great Lakes caused by this lowering constitutes an obstruction to navigation. It is impracticable to limit the navigation of the Great Lakes only to avenues laid down as sailing courses.

17925—24†——8

In times of storm and fog many vessels diverge widely from the avenue traversed in times of clear air and fair weather. Any shoal or shallow area which has less depth by reason of the diversion at Chicago is an increased menace to vessels under these conditions, and is therefore an obstruction to navigation. While the limitations of loading will for a large percentage of the tonnage be fixed by the critical places in the main avenues of commerce, such as the Soo Locks, the Middle or West Neebish in the St. Marys River, Lake St. Clair, the lower Detroit River, the West end of Lake Erie, the approach to the particular harbor as Milwaukee, Chicago, Gary, Indiana Harbor, Toledo, Cleveland, Buffalo, or Toronto, the vast shallows and shoals of the Great Lakes are still more of a menace with lower levels than with such levels as would exist in the absence of the diversion at Chicago. The foregoing is, we believe, conclusively established by the evidence. See particularly the testimony of appellee's witness Ray (Rec. Vol. I, pp. 29, 273–278, 281–3), Shenehon (Rec. Vol. I, pp. 320–321), and Livingstone (Rec. Vol. I, p. 222) and for further evidence (Rec. Vol. I, pp. 105, 201, 246–248, 429). Ray cites many particular instances in which a difference in draught of two inches determines whether a boat will ground or clear (see Rec. Vol. I, pp. 246–248).

VI

Evidence as to methods of compensating for loss of lake level

To offset the damage to navigation caused by the lessened drafts resulting from the diversion at Chicago, three suggestions are offered by the appellant. First, build boats of such additional length that on the lessened draught they would carry the same amount of freight as the shorter boats on the impaired draught; second, excavate the various waterways and deepen the lock chambers to regain the lost draught; third, raise the surface levels of the various lakes and rivers by regulating or compensating works, so as to secure the original draughts.

Offsetting damage by lengthening vessels

The first suggestion of lengthening the vessels appears trivial. The appellant's witness Sadler estimated the cost of additional length to offset loss of draught inches as follows:

93 vessels 500 to 600 ft. in length	$1,404,300
73 vessels 600 ft. class	$1,197,200

This method of lessening the extent of the damage to commerce is, of course, a direct tax on the vessel interests, and a tax that goes on eternally, and is worthy of small consideration as a feasible solution.

Partially restoring depths by dredging, etc.

The second suggestion of restoring navigable depths by deepening the bottom in the various waterways, including the local chambers, had already received consideration by the International Waterways Com-

mission in its report on the Chicago Drainage Canal in 1907. The findings of this Commission are as follows:

> 28. The total cost of restoring the depth in the harbors of the Great Lakes and the channels between the lakes is therefore roughly $10,000,000, and of restoring it in the Welland and St. Lawrence Canals is $2,500,000 additional, or $12,500,000 in all.
>
> 29. The shores of the Great Lakes are very far from being fully developed, and it is highly probable that many harbors not now in existence remain to be created, or if in existence remain to be improved. The lowering of the lakes' surface increase the difficulty and cost of such improvements. This consideration is of importance, although no money value can now be given it.
>
> 30. The expenditure of the sums mentioned above will restore the depths now existing, but it will not prevent very serious annoyance to the navigation interests during the execution of the work. The time required will be several years, and in the meantime the vast commerce of the Great Lakes will be hampered not only by deficient depth but also by the occupation of the channels, already crowded with commerce, by the excavating machines. (Rec. Vol. 4, p. 2422.)

The highly superficial character of the estimates made by the appellant's witness Ripley is revealed by his testimony. (Rec. Vol. III, pp. 1306–7, 1347–9, 1350–1, 1353.)

This testimony indicates very clearly that the method of excavation and deepening alone will not restore the navigable depths when the surface levels are lowered four inches or six inches, and that the cleaning-up processes will not restore the advantageous condition of the channel as it would exist in the absence of the lowering caused by the diversion at Chicago. The extra depths excavated by prior contracts are an asset to present navigation by allowing some partial clearance, at least, below the keels of vessels for more facile navigation; and in view of the greater navigable depths which the testimony in this case indicates are certain to prevail on the Great Lakes, the work of excavation already done is an asset towards the future deepening which the appellant in this case may not impair. In the end, Mr. Ripley's estimate is of so approximate a character and has omitted so many important channel ways, and has failed to take into account great lake areas where vessels may seek refuge in time of storm, that the cost indicated by Mr. Ripley, great as it is, is entirely inadequate to restore the navigable depths of the Great Lakes system and remove the obstructions to navigation created by the diversion at Chicago.

Regulating or Compensating Works

This method of restoration appears in some cases to represent sound engineering practice. The Board of Engineers on Deep Waterways in its report of June

30th, 1900, recommends regulating works to be placed at the head of the Niagara river. These works were to consist in part of submerged dams or weirs, and in part of movable gates operated from overhead platforms resting on masonry piers. The estimated cost at this time was $796,923. The raising of the level of Lake Erie contemplated by these works was much in excess of the lowering caused by the diversion of 10,000 cubic second feet at Chicago, and was probably enough to more than compensate in Lake St. Clair and nearly compensate Lakes Michigan and Huron and the St. Marys river. Appellee's witness, Alfred Noble, was a member of this board. Mr. Noble testified (Rec. Vol. I, page 29) that since 1900 the cost of engineering works in general has increased. The presumption is that these regulating works would cost more at the present time than in 1900. The maintenance and operation of regulating works of this character should be taken into consideration in estimating the full outlay.

The International Waterways Commission in a report dated June 20, 1913, recommends compensating works to be built in the Niagara river just above Chippewa, within a few miles of the rapids above the cataract at Niagara Falls. These compensating works consist of a series of submerged concrete weirs stretching across the river. The estimated cost of these works is $3,500,000. The cost of annual maintenance and operation is not stated. These compensating works are estimated to

raise the level of the Niagara river in the vicinity of the works about three feet, and to raise the mean level of Lake Erie 4¼ inches, the mean level of Lake St. Clair about 2¾ inches, and the mean level of Lakes Huron and Michigan about 1⅛ inches. Notwithstanding the great expense of these works, it appears that for the mean lake level compensation is not such as to fully offset a lowering of 5½ inches of Lake Erie caused by the diversion of 10,000 cubic second feet at Chicago. In times of low water, however, the estimated compensating effect is about 6⅛ inches, which more than compensates the lowering by the diversion above mentioned. It is interesting to note in connection with the project of the International Waterways Commission the criticisms which this commission makes in its preliminary report upon the earlier project of June 30th, 1900, of the Board of Engineers on Deep Waterways. As indicative of the extreme differences of opinion as to the feasibility, expense, best method, and probable results of such regulating or compensating works as the appellant proposes, we need only refer to the testimony in which the subject is discussed. (Rec. Vol. IV, pp. 2616–2621, 2621–2627; Vol. V, p. 3348; Vol. IV, pp. 2614–2615, 2588–89; Vol. III, p. 1172, 1173–1175; Vol. II, pp. 742–3; Vol. III, pp. 1336–1339; Vol. I, p. 328.)

The International Waterways Commission regards the project of the Board of Engineers on Deep Waterways as impracticable. The Board of Engineers on Lakes to Gulf Waterway criticizes as unwise the

scheme of regulation proposed by Dean Shenehon. Appellant's witness Ripley appears to regard movable regulating works as desirable to maintain the full section of waterway in times of high water, which the scheme of the Lakes to Gulf Board violates in its method of submerged weirs. The project of submerged weirs of the above Board places the crest of these weirs 24 to 25 feet below the surface level of the St. Clair River, and the effect of these weirs is to increase the current wherever the weirs are located. In view of future navigable depths of 30 feet on the Great Lakes as indicated by the works of the Canadian government in the Welland Canal, these submerged weirs will become an obstruction to navigation. It is a question whether this system of submerged weirs on the St. Clair River would not augment the formation of ice blockades, and therefore tend to unduly raise the levels of Michigan-Huron and deplete during the winter season the elevations for Lakes Erie and Ontario, so that the Great Lakes system is thrown out of coordination.

We can not believe, however, that this Court will regard any of this evidence as material to the issues of this case.

To put into operation any scheme of compensation or regulation may require under the existing treaty with Great Britain the favorable action of the Joint High Commission.

Article IV of the treaty with Great Britain concerning the boundary waters between the United

States and Canada, proclaimed May 13, 1910, provides:

> The high contracting parties agree that, except in cases provided for by special agreement between them, they will not permit the construction or maintenance on their respective sides of the boundary of any remedial or protective works or any dams or other obstructions in waters flowing from boundary waters or in waters at a lower level than the boundary in rivers flowing across the boundary, the effect of which is to raise the natural level of waters on the other side of the boundary, unless the construction or maintenance thereof is approved by the aforesaid International Joint Commission. (Rec. Vol. IV, p. 2564.)

The evidence submitted by the appellant as to the cost of deepening channels and the expense of constructing compensating works only emphasizes the fact that this diversion of water at Chicago is part of one problem affecting both this nation and Canada, the solution of which, so far as this nation is concerned, must be in the hands of the Federal Government. It is the contention of the appellee that this is precisely where it has been placed by Congress; and that the withdrawal of the water, as well as the deepening of channels and the building of compensating works, must be authorized by Congress and approved by the War Department.

VII

Injury to navigation due to current caused by excess flow through Chicago River

The current in the Chicago River in excess of the current authorized by the Secretary of War is extremely dangerous to navigation. This matter becomes particularly important in this case not only because it is a material interference with navigation but because it is in direct violation both of the Act of Congress of March 3, 1899, and the permits of the Secretary of War.

It appears in the record that the flow through the Chicago River varies throughout the day. It is increased in late afternoon and evening, which is the time when the greatest demand is being made upon the power house at Lockport.

It is true that the cross section of the Chicago River has been increased since 1901, and that a larger volume of flow can be accommodated without increasing the current. The testimony of the Chief Engineer of the appellant (Rec., Vol. III, p. 1598) on direct examination is as follows:

> The river has been widened to a width of at least 200 feet and it has been deepened so that at the dock lines there is a depth of water of 16 feet, gradually deepening to a point 50 feet out from the docks where it is 26 feet deep for the middle 100 feet of the river.

This testimony is somewhat misleading. This does not apply to openings at bridges, and there are

many bridges in the Chicago river. Upon cross-examination of this witness (Rec. Vol. VI, pp. 3482–3488) it appeared that at the bridge openings the total width in some cases is as low as 140 feet, and at the St. Charles Air Line Bridge the width of the two draws are 55½ and 59½ feet. The width of the river is less than 175 feet at nearly every bridge between Halsted Street and the lake; at Van Buren Street the total width, including a by-pass, is 156 feet; at Taylor Street the width is 140 feet, with two by-passes of 137 square feet each.

Of course, the situation at the narrowest points is the one to be considered. These are the critical, the dangerous, points.

The testimony shows that the current in the Chicago river is greatly in excess of a mile and a quarter per hour and that it is detrimental and dangerous to navigation. The appellee called as witnesses a number of ship captains and navigators who have spent their lives in navigation and who have had experience in navigating ships on the Chicago river from two to thirty years.

The testimony of these men was that the current in the river is from two to ten miles per hour; that the safe draught was not over eighteen and a half feet; and that it was very dangerous to navigate the Chicago river because of the excessive current. (Rec. Vol. V, pp. 3020–3021, 3022–3023, 3023–3026, 3028, 3029, 3031–3033, 3033–3034, 3043, 3044, 3054.)

The largest boats do not navigate the Chicago river; they can not come in. A boat, however, of

50 feet beam loaded to 20 feet would occupy a cross section of approximately 900 square feet. Two such boats would occupy about one-half of the entire cross section of the river at many places, leaving that part of the river nearest the docks, the sides and bottom where there is normally a slow current for the passage of water. In this way the mean velocity is necessarily doubled and the maximum velocity would be correspondingly increased. While the testimony that there is a current of ten miles an hour may be somewhat exaggerated, yet from this evidence it is obvious that there must be a very great current and of course many times in excess of a mile and a quarter per hour rate.

Most of the witnesses were not cross-examined. What cross-examination there was by appellant was largely to show that the Chicago river is now deeper and wider than it was before the Sanitary District canal was opened, and that much of this work had been done by the Sanitary District. Of course, this is perfectly true, and as far as cross section is concerned, the navigability of the Chicago river is now greatly improved. On the other hand, during the last fifteen years, as is pointed out elsewhere in this brief, the size of boats has greatly increased and channels and harbors have had to be deepened and widened accordingly. Also, it should be kept in mind that the improvements in the Chicago river have been made with the consent of the Secretary of War and the Chief of Engineers.

The current and the navigability generally of the Chicago river was before Secretary of War Stimson upon the application of the Sanitary District of February 5, 1912. (Rec. Vol. VI, pp. 3616, 3618.)

As the condition exists to-day in the Chicago river there is a current far in excess of any current that has received any semblance of approbation by the Secretary of War, and a current which is detrimental and in fact dangerous to the navigation of the river. This is caused by the fact that the appellant is flowing through that river more water than is authorized by the Secretary of War. It amounts to a modification of the condition and capacity of the channel of a navigable water of the United States, and aside from all other elements of the case is sufficient to justify an injunction by this court in the case involving the diversion through the Chicago river.

VIII

There are no acts of Congress and no investigations or surveys of United States officers which amount even remotely to an invitation to build this canal, or to authority for its construction

Appellant's contention that authority for its unauthorized acts is to be found in the Act of Congress of 1827 relating to the Illinois and Michigan Canal, is discussed at length under our Point V, A (*infra*, p. 203).

Similar contentions with respect to the Niagara Falls Act of 1906 and the Canadian Boundary

Waters Treaty of 1910, are dealt with under subdivisions B and C of Point V (*infra*, pp. 219 and 226).

The attempt to work out some sort of estoppel from the reports of Government engineers with respect to the improvement of navigation between Lake Michigan and the Mississippi river, is discussed in our Point VIII (*infra*, p. 255).

IX

The evidence as to the cost of building sewers, purifying works, etc., in case the unauthorized diversion is enjoined

Appellant's brief (pp. 73–74) presents certain extraordinary conclusions as to the effect of forcing it and the City of Chicago to adopt methods such as are successfully being employed by practically all the large cities on the Great Lakes. In view of the appellee's motion to strike those portions of appellant's answer setting up such matters on the ground of their immateriality, no attempt was made by the appellee to rebut the testimony on which the conclusions are based. Reference to the record will disclose that the testimony is largely by interested witnesses and that it is not invulnerable. Inasmuch as the appellant predicates its contentions on the theory that such testimony is "undisputed evidence," it will not be inappropriate to direct the attention of this Court to certain significant facts.

The water supply and sewage disposal of a great city are usually parts of a problem which is handled by *one* municipality. In the case of Chicago we have

two municipal corporations dealing with this problem—the City of Chicago and the Sanitary District. The city has control of the water supply and the sewers. The Sanitary District undertakes to dispose of the sewage. The water supply is taken from Lake Michigan, and the expense to the city, therefore, for water supply is very much less than other cities are obliged to incur for that purpose.

Even if the City of Chicago were obliged to rebuild its system of sewers and to construct purifying works in order to take care of its sewage with the quantity of water now authorized by the Secretary of War, the expense to which it would be put on account of water supply and sewage disposal would not be greater, in proportion to its population, than that to which other cities have been put and which other cities must incur in the near future. Mr. Fuller, one of the witnesses for the appellant, stated (Rec. Vol. III, p. 1468) that the cost to the City of Washington for water supply and sewage disposal works was $104 per capita, and presented figures showing that for a part of its water supply works the City of New York has already expended more than $200,000,000. In the light of these figures it can not be said that appellant's highest estimate of expense is more than some other cities are paying for a pure water supply.

It will not do to say that there is no other way of disposing of the sewage of Chicago, because many other cities are obliged to dispose of their sewage, and are disposing of it, in other ways.

It should be remembered that except for a brief hearing in April, 1923, the bulk of the testimony on this question was heard prior to December, 1914. At that there is a statement in the record of the hearing before the Secretary of War as to other successful methods of sewage disposition in London, Manchester, and Birmingham, England; Emscher District, Germany; Columbus, Ohio; Baltimore, Md.; and Toronto, Canada. In all these cases, according to the statement—

> the quantity of water for diluting the final affluents is quite insignificant.

The statement says further that—

> the subject of purification of sewage is far beyond the experimental state. * * *
>
> It is to be noted also that the experience of other cities, notably the experience of Manchester with the Manchester Ship Canal, shows conclusively that the natural discharge of the Chicago river plus, say, 1,000 second-feet drawn from Lake Michigan for navigation purposes, would be amply sufficient to carry away through the drainage canal the purified effluents of Chicago and the whole Sanitary District. (Rec. Vol. VI, pp. 3648–3649–3650–3651–3652.)

The appellant itself has recognized that it is only a matter of time when it must adopt another method of sewage disposal. (See statement of appellant; Chief Engineer at the hearing before the Secretary of War, Rec. Vol. VI, pp. 3691–3692.)

The reports of Engineers Hering and Fuller (Rec. Vol. I, pp. 496–548), and of Mr. Wisner, Chief Engineer of the appellant, show clearly that there are other feasible methods of sewage disposal which may be used by Chicago, and that, really, the only question involved is one of expense. The Secretary of War dealt with this contention of the appellant as follows:

> I have carefully examined, however, the evidence which both sides have introduced bearing upon the sanitary needs of the City of Chicago, and my conclusion is in no way shaken. I am not persuaded that the amount of water applied for is necessary to a proper sanitation of the City of Chicago. The evidence indicates that at bottom the issue comes down to the question of cost. Other adequate systems of sewage disposal are possible and are in use throughout the world. The problem that confronts Chicago is not different in kind but simply larger and more pressing than that which confronts all of the other cities on the Great Lakes, in which nearly 3,000,000 people of this country are living. The urban population of those cities, like that of Chicago, is rapidly increasing, and a method of disposition of their sewage, which will not injure the potable character of the water of the lakes, must sooner or later be found for them all. The evidence before me satisfies me that it would be possible in one of several ways to at least so purify the sewage of Chicago as to require very much less water for its dilution than is now required by it in its unpurified condition. A recent report of the

> engineer of the sanitary commission (Oct. 12, 1911) proposes eventually to use some such method, but proposes to postpone its installation for a number of years to come, relying upon the present more wasteful method in the meanwhile. It is manifest that so long as the city is permitted to increase the amount of water which it may take from the lakes there will be a very strong temptation placed upon it to postpone a more scientific and possibly more expensive method of disposing of its sewage. (Rec. Vol. VII, pp. 14–15.)

This feature of the case need not, we believe, be further discussed for, after all, under the theory of appellee, these considerations urged by the appellant can not be given effect over the paramount rights of Federal control of Navigation.

ARGUMENT ON THE LAW

(Pages 123-326)

I

All the waters here involved are "navigable waters of the United States" as that term is used in the various acts of Congress

As is already apparent from our Statement of the Case, the waters involved in this litigation are the following:

1. The Great Lakes except Lake Superior, the various connecting waters between the Great Lakes and the St. Lawrence River.

2. The Chicago River, including its branches, and the Calumet River, including its branches.

3. The Desplaines, Illinois, and Mississippi Rivers.

There is substantially no dispute as to the navigable character of these waters (except possibly as to the upper portion of the Little Calumet River), nor is it disputed that these waters are embraced within the term "navigable waters of the United States" both as employed in the Acts of Congress and as defined by this Court in discussing the scope of the power of Congress with reference to interstate commerce. We shall, however, take this occasion to refer to decisions of this Court which determine the matter conclusively.

The definition of "navigable waters of the United States" is originally to be found in the case *The Daniel Ball* v. *United States*, 1871, 10 Wall. 557,

although it was necessarily involved in the prior decision of this Court in the case of *The Propeller Genesee Chief et al.* v. *Fitzhugh et al.*, 1851, 12 How. 443, and was recognized by the Congress of the Confederation over sixty years prior thereto in the Ordinance of 1787 (see *Economy Light & Power Co.* v. *United States*, 256 U. S. 113). The definition as stated in the case of *The Daniel Ball* is as follows:

> Those rivers must be regarded as public navigable rivers in law which are navigable in fact. And they are navigable in fact when they are used, or are susceptible of being used, in their ordinary condition, as highways for commerce, over which trade and travel are or may be conducted in the customary modes of trade and travel on water. And they constitute navigable waters of the United States within the meaning of the Acts of Congress, in contradistinction from the navigable waters of the States, when they form in their ordinary condition by themselves, or by uniting with other waters, a continued highway over which commerce is or may be carried on with other States or foreign countries in the customary modes in which such commerce is conducted by water. (10 Wall. 563.)

The principles thus stated have been recognized and applied by this Court in a great many cases among which we mention *United States* v. *The Steamer Montello*, 1870, 11 Wall. 411; same case, 1874, 20 Wall. 430; *Oklahoma* v. *Texas*, 1921, 258 U. S. 574; *Brewer-Elliott Oil & Gas Co.* v. *United States*, 1922, 260 U. S. 77.

The character of the Chicago River, its branches and forks as navigable waters of the United States is specifically recognized in *Escanaba and Lake Michigan Transportation Co.* v. *City of Chicago*, 1883, 107 U. S. 683. The same is true of the Calumet River in *Cummings* v. *Chicago*, 1902, 188 U. S. 410, and of the Desplaines and Illinois Rivers in *Economy Light & Power Co.* v. *United States*, 256 U. S. 113.

The Great Lakes, their connecting waters, and the St. Lawrence River, in addition to being navigable waters of the United States (*The Propeller Genesee Chief*, 12 How. 443; *United States* v. *Rodgers*, 150 U. S. 249; *Illinois Central R. R. Co.* v. *Illinois*, 146 U. S. 387) are "international waters, being dedicated in perpetuity to the common navigation of all the inhabitants" of the countries on both sides of the boundary (Moore, International Law Digest, Vol. 1, p. 675; Hyde, International Law, 1922, Vol. 1, pp. 320–321).

The international character of these waters has been recognized by this court in *The Propeller Genesee Chief, supra* (pp. 453–454):

> These lakes are in truth inland seas. Different states border on them on one side, and a foreign nation on the other. A great and growing commerce is carried on upon them between different states and a foreign nation, which is subject to all the incidents and hazards that attend commerce on the ocean. Hostile fleets have encountered on them, and prizes been made; and every reason which existed for the grant of admiralty jurisdiction

> to the general government on the Atlantic seas, applies with equal force to the lakes. There is an equal necessity for the instance and for the prize power of the Admiralty Court to administer international law, and if the one cannot be established, neither can the other.
>
> Again. The Union is formed upon the basis of equal rights among all the States.
>
> * * * * *
>
> That equality does not exist, if the commerce on the lakes and on the navigable waters of the West are denied the benefits of the same courts and the same jurisdiction for its protection which the Constitution secures to the States bordering on the Atlantic.

In *Moore* v. *American Transportation Co.*, 24 How. 1, 37–38, this Court, in holding that navigation of the Great Lakes did not fall within the statutory phrase "inland navigation," said:

> But the business upon the great lakes lying upon our northern frontiers, carried on between the states, and with the foreign nation with which they are connected (and this is the only business which Congress can regulate, or with which we are dealing), is of a very different character. They form a boundary between this foreign country and the United States for a distance of some twelve hundred miles, and are of an average width of at least one hundred miles; and this, without including Lake Michigan, of itself three hundred and fifty miles in length and ninety in breadth, which lies wholly within the United States.

> The aggregate length of these lakes is over fifteen hundred miles, and the area covered by their waters is said to be some ninety thousand square miles. The commerce upon them corresponds with their magnitude. * * *
>
> This commerce, from its magnitude, and the well known perils incident to the lake navigation, deserves to be placed on the footing of commerce on the ocean; and we think, in view of it, Congress could not have classed it with the business upon rivers, or inland navigation, in the sense in which we understand these terms.
>
> These lakes are usually designated by public men and jurists, when speaking of them, as great inland waters, inland seas, or great lakes.

In *United States* v. *Rodgers*, 150 U. S. 249, 258, the Great Lakes were held to be "high seas" within the meaning of an Act of Congress. See also *United States* v. *Chandler-Dunbar Water Power Co.*, 229 U. S. 53, in which this Court said that the matter of the levels of the Great Lakes (p. 67)—

> was a matter of international consideration, for Canada, as well as the United States, was interested in the control and regulation of the lake water levels.

The international character of the Great Lakes and their connecting waters is confirmed by the Boundary Waters Treaty of January 11, 1909. Inasmuch as this treaty is discussed more at length elsewhere we shall pause here only to note that to a limited extent Lake Michigan is likewise given an international

character by the covenant in Article I that the free and open navigation provided for with respect to the boundary waters "shall extend to the waters of Lake Michigan."

II

The level of the Great Lakes and the diversion of water from the St. Lawrence River basin to the Mississippi River basin are both subjects of interstate commerce national (and also international) in character and are of such a nature as to require exclusive control by Congress. Independently, therefore, of any assertion of control by Congress, the Illinois Enabling Act of 1889, in so far as it authorized and directed the appellant to do the acts here complained of without authorization of Congress, was void.

We propose under this heading to demonstrate that independently of the Acts of Congress of September 19, 1890, and March 3, 1899, the State of Illinois (acting through its creation, the Sanitary District of Chicago) had no right or power to do the acts here complained of. Particularly it had no right to do any act, whether within or without its territorial limits, that would lower the level of the Great Lakes, their connecting waters, and the St. Lawrence river, or to create a large navigable river debouching into another river basin, without the authority of Congress. The subject of the level of these waters is, we believe, national (and, indeed, international) in character; it is, therefore, of a sort as to which the non-action of Congress is to be taken as a declaration that it shalll be free from interference by the several States. The conclusion to which we are led is that Sections 20

and 23 of the Enabling Act of the Illinois legislature of 1889, in so far as they purported to require the appellant to withdraw certain amounts of water from Lake Michigan (20,000 cubic feet for each 10,000 inhabitants of the district) irrespective of the authorization of Congress, were unconstitutional and void because of their inevitable conflict with the exclusive power of Congress over such subjects of interstate commerce.

In view of the fact that Congress has beyond question asserted its paramount control over these subjects by the Act of March 3, 1899 (Section 10 of which specifically prohibits these acts of the appellant), our contentions under the present heading may be thought unnecessary. We are led to include them in this brief by the misleading assertions by appellant as to the state of the law prior to March 3, 1899, from which appellant attempts to work out some sort of authority or justification for its defiance of the law after that date.

In the first place, appellant's brief reiterates frequently that an apparently unlimited diversion of water by it was lawful under the law as it existed prior to the assertion of Federal control by Congress in the Act of September 19, 1890. We do not understand the significance of this assertion, for admittedly the Act of Congress of September 19, 1890, was passed two years before any contracts had been let or work begun on the excavation of the channel for the canal. The basis for this contention, whatever may be its

significance, is apparently in the line of decisions beginning with *Willson* v. *Black Bird Creek Marsh Co.*, 2 Pet. 245, which hold that, in the absence of legislation by Congress, a state may lawfully authorize an obstruction of navigable waters *entirely within its boundaries*. As is manifest from our analysis of these cases (infra. p. 136) this doctrine was never extended to navigable waters which, like the Ohio River or the Great Lakes, are not wholly within the boundaries of a single state; in fact, its application to these waters was negatived in such cases as the *Wheeling Bridge Case*, 13 How. 558. The extent of lawful state action in such waters was restricted to matters purely local in character, such as the regulation of pilotage (*Cooley* v. *Port Wardens*, 12 How. 299) or the improvement of harbors (*Mobile County* v. *Kimball*, 102 U. S. 691). The authorization of Congress was and always has been a necessary prerequisite to the creation of obstructions or modifications of the navigable capacity of such waters.

In the second place, appellant's brief reiterates no less frequently that its acts were "affirmatively authorized by law" within the meaning of that phrase as it appears in Section 10 of the Act of Congress of September 19, 1890. We cannot conceive what bearing this contention has on any questions involved in this case for the Act of Congress of March 3, 1899, was enacted into law nearly a year before the appellant (under the permit of May 8, 1899) accomplished a connection between its channel and the Chicago

River and thereby diverted water from Lake Michigan. The basis for this contention, however, is a misapplication of the decision of this Court in *United States* v. *Bellingham Bay Boom Co.*, 176 U. S. 211, which held that in the case of an obstruction of a navigable stream confined *wholly within the boundaries of a State*, the words "affirmatively authorized by law" in the Act of 1890 included lawful authorization by an act of the state legislature (see infra, p. 201). Manifestly, an obstruction of a navigable water like Lake Michigan or the Ohio and Mississippi Rivers could not *lawfully* be authorized by legislation of a single state *either* before or after the enactment of the Act of 1890.

The international character of the subject of the levels of the Great Lakes was noted by this Court in *United States* v. *Chandler Dunbar Water Power Co.*, 229 U. S. 53, at pp. 66–67:

> That outflow [i. e., from Lake Superior] has great influence both upon the water level of Lake Superior and also upon the level of the great system of lakes below which receive that outflow. A difference of a foot in the level of Lake Superior may influence adversely access to the harbors on that lake. The same fall in the water level of the lower lakes will perceptibly affect access to their ports. This was a matter of international consideration, for Canada, as well as the United States, was interested in the control and regulation of the lake water levels.

If we are correct in our contention that this subject of lake levels is *national* in character and is therefore exclusively under the control of Congress, then it makes no difference whether interference with that control proceeds from a state statute or from the acts of individuals. As was said in *Kansas City Street R. Co.* v. *Kaw Valley Drainage Dist.*, 233 U. S. 75, at p. 78:

> The freedom from interference on the part of the states is not confined to a simple prohibition of laws impairing it, but extends to interference by any ultimate organ.

We shall now proceed to a brief citation of cases involving the distinction between subjects *local* and subjects *national* in character with respect to interstate commerce, and particularly with respect to obstructions and modifications of the navigable capacity and condition of navigable waters of the United States.

A

Those subjects of interstate commerce which require a general system or uniformity of regulation are national in character, and as to such subjects the power of Congress is exclusive; those subjects of interstate commerce admitting of diversity of treatment according to the special requirements of local condition are local in character, and as to such subjects the States may act within their respective jurisdictions until Congress sees fit to act

Cases involving the principle set forth in the foregoing subheading have been reviewed so recently and so thoroughly in the *Minnesota Rate Cases*, 230 U. S. 352, that we shall not attempt to do more than observe more particularly the application of

the principle to obstructions of navigation and of the navigable capacity of navigable waters of the United States. We quote, however, the following pertinent portions of the opinion in that case (pp. 399–400):

> There is no room in our scheme of government for the assertion of state power in hostility to the authorized exercise of Federal power. The authority of Congress extends to every part of interstate commerce and to every instrumentality or agency by which it is carried on, and the full control by Congress of the subjects committed to its regulation is not to be denied or thwarted by the commingling of interstate and intrastate operations. This is not to say that the nation may deal with the internal concerns of the state, as such, but that the execution by Congress of its constitutional power to regulate interstate commerce is not limited by the fact that intrastate transactions may have become so interwoven therewith that the effective government of the former incidentally controls the latter. This conclusion necessarily results from the supremacy of the national power within its appointed sphere.
>
> * * * * *
>
> The grant in the Constitution of its own force, that is, without action by Congress, established the essential immunity of interstate commercial intercourse from the direct control of the states with respect to those subjects embraced within the grant which are of

such a nature as to demand that, if regulated at all, their regulation should be prescribed by a single authority. It has repeatedly been declared by this court that as to those subjects which require a general system or uniformity of regulation, the power of Congress is exclusive. In other matters, admitting of diversity of treatment according to the special requirements of local conditions, the states may act within their respective jurisdictions until Congress sees fit to act; and, when Congress does act, the exercise of its authority overrides all conflicting state legislation.

* * * * *

The principle which determines this classification underlies the doctrine that the states can not, under any guise, impose direct burdens upon interstate commerce. For this is but to hold that the states are not permitted directly to regulate or restrain that which, from its nature, should be under the control of the one authority, and be free from restriction, save as it is governed in the manner that the national legislature constitutionally ordains.

In *Covington & Cincinnati Bridge Co.* v. *Kentucky*, 154 U. S. 204, will be found a summary of cases applying the principle to questions of navigation, and a later summary is contained in the briefs of counsel in *Wilmington Transportation Co.* v. *R. R. Commission of California*, 236 U. S. 151.

The cases are not hard to classify for they fall naturally into two groups: (1) Those involving waters, the navigable portions of which, like the

Chicago and Calumet Rivers, are wholly within the bounds of a single state, and which for convenience will be referred to as *State* navigable waters, and (2) those involving waters the navigable portions of which, like Ohio River and Lake Michigan, are in two or more states, or like the other Great Lakes form boundaries between this and other countries, and which for convenience will be referred to as *interstate* navigable waters.

B

Until Congress asserted its paramount control the subject of obstructions to the navigable capacity of State navigable waters, not affecting navigable waters without the State, was deemed to be local in character and was held to be subject to the authority of the State

We have no doubt whatever but that prior to the assertion of Federal control over the matter the State of Illinois might lawfully have authorized the construction of bridges in the Chicago and Calumet Rivers. Bridges, prohibitive as they might be of navigation in those rivers, could have no effect on navigation elsewhere. So, too, the State might have authorized dams in those rivers so long as the water was ultimately permitted to flow into Lake Michigan and the dam was for some legitimate purpose within the power of the State. Such obstructions, however, differ greatly from an obstruction of an interstate water, whether by a bridge whose span is too low or by decreased water levels which limit the draught of boats. Such cases will be discussed under our next subheading.

(1) *Cases involving dams across state navigable waters* are *Willson* v. *Black Bird Creek Marsh Co.*, 2 Pet. 245;

Pound v. *Turck*, 95 U. S. 459; *Huse* v. *Glover*, 119 U. S. 543; and *Monongahela Navigation Co.* v. *United States*, 148 U. S. 312.

(2) *Cases involving bridges across state navigable waters* are *Gilman* v. *Philadelphia*, 3 Wall. 713; *Escanaba and Lake Michigan Transportation Co.* v. *Chicago*, 107 U. S. 683; *Cardwell* v. *American Bridge Co.*, 113 U. S. 205; *Hamilton* v. *Vicksburg, Shreveport and Pacific R. R. Co.*, 119 U. S. 280; *Willamette Iron Bridge Co.* v. *Hatch*, 125 U. S. 1, and *Lake Shore & Michigan Southern R. Co.* v. *Ohio*, 165 U. S. 365.

(3) *Cases involving improvement of state navigable waters* are *Withers* v. *Buckley*, 61 U. S. 84, *Sands* v. *Manistee River Improvement Co.*, 123 U. S. 288. In this connection may also be considered cases like *Huse* v. *Glover*, 119 U. S. 459, where by means of locks and dams the navigation of a state navigable water has been facilitated.

In every one of these cases the navigable water was, like the Black Bird Creek, the Chippewa River, and the Schuylkill River, wholly within the State which authorized the obstruction. In none of them did the obstruction affect or injure the navigable capacity of an *interstate* navigable water.

C.

With respect to interstate navigable waters, the subject of obstructions to their navigable capacity has always been deemed national in character, and subject to the exclusive control of Congress.

The obstruction resulting from a bridge the span of which is too low, and the obstruction resulting

from a lowering of water level, are manifestly of the same character. In the one case a boat can not clear because its mast or chimney will strike the bridge; in the other case, a boat can not clear because its keel will strike the river or lake bed. There is no distinction in principle, therefore, between the two types of obstruction, and the action of appellant in the present case is exactly the same in nature and effect as if it had thrown a bridge across Lake Michigan, or any of the Great Lakes or their connecting waters, the span of which was six inches too low for the passage of the larger vessels. That a State may not lawfully create such an obstruction, even in the absence of any affirmative assertion of control by Congress, is, we believe, conclusively established by such cases as the *Wheeling bridge case*, 13 How. 553, and *Covington & Cincinnati Bridge Co.* v. *Kentucky*, 154 U. S. 204. It was impliedly held in all the cases discussed in our preceding subheading, having to do with obstructions of *state* navigable waters.

We shall first, however, by a brief review of the cases, point out the limits to which this Court has heretofore gone in upholding state action with reference to *interstate* navigable waters.

1. *The power of the States with respect to interstate navigable waters has at all times been limited to matters purely local in character, incidental to and aiding commerce, and not affecting navigation elsewhere*

It would serve no useful purpose to undertake an analysis of all the cases which might properly be

grouped under this subheading. They are important only in so far as they illustrate the application to state restrictions on navigation of interstate waters, of the distinction between subjects of interstate commerce local and national in character. In the cases which have already been referred to (*supra*, p. 134) are cited what we believe to be representative cases on this question, and we need not repeat the citations or review the facts of each case. It will be noticed, however, that the cases fall into four fairly well-defined classes. Other, and perhaps better, classifications might possibly suggest themselves, but would not, we believe, add anything to the solution of our present query.

(*a*) *The regulation of pilotage.*—The case which originally dealt with this subject, and which may be regarded as the leading case is *Cooley* v. *Port Wardens*, 12 How. 299.

(*b*) *Protection of coasts and improvement of harbors, bays, and streams.*—The leading case dealing with this subject is *Mobile County* v. *Kimball*, 102 U. S. 691.

(*c*) *Quarantine and inspections laws and the policing of harbors.*—A typical case dealing with this subject is *Morgan's, etc., Co.* v. *Louisiana Board of Health*, 118 U. S. 455. This and similar cases are important in our consideration of appellant's claim of justification under the state's police power.

(*d*) *Regulation of wharfs, piers, and docks.*—A typical case dealing with this subject is *Parkersburg, etc., Trans. Co.* v. *Parkersburg*, 107 U. S. 691.

It will be noticed that there are seemingly no cases involving the right of the state, in the absence of legislation by Congress, to divert water from an interstate navigable water for purposes of sewage disposition or drinking water. The principles applied in the foregoing cases suggest, however, the correct application of the principle distinguishing between subjects of interstate commerce local and national in character. The ordinary diversion, which might properly be regarded as local in character, is that which returns the water thus used to the same navigable body of water. Such a use has no effect on the level or the navigability of that water, and is the method employed by nearly every city, so far as we know, except Chicago.

It will further be noticed that in all the foregoing cases, even those involving public health, such as quarantine and inspection laws, the paramount control of Congress over the various subjects is explicitly recognized, to be asserted when and where it sees fit.

2. Obstructions to the navigable capacity of interstate waters without authority from Congress have always been held unlawful, being national in character and subject to the exclusive control of Congress

We submit that the case of *Pennsylvania* v. *Wheeling and Belmont Bridge Co.* (usually referred to as the *Wheeling Bridge Case*), 13 How. 518, conclusively establishes that, even in the absence of any assertion of its paramount control by Congress, obstructions to the navigable capacity of interstate

waters are unlawful. In that case the state of Pennsylvania, by original bill filed in this court, sought to restrain the Bridge Company from proceeding with the construction of a bridge across the Ohio River at Wheeling. The facts of the case resemble the instant case to a striking extent.

At the point when the bridge was being constructed the Ohio River was wholly within the boundaries of Virginia, but was, of course, an interstate navigable water because of its serving as a highway of commerce for the states both above and below Wheeling. In this respect, therefore, it more than covers the instant case where we are dealing with a situation exactly as if a bridge were thrown across any of the Great Lakes or their connecting waters. The Bridge Company justified its act by authority conferred upon it by an act of the Virginia Legislature, just as appellant does under the Illinois Enabling Act of 1889. During the pendency of the suit the Bridge Company proceeded with the construction of the bridge so that it was completed at the time the decision of this Court was rendered, holding it an unlawful obstruction; just as in the instant case appellant has proceeded with its program of construction of canals, diverting water through the Calumet River, and taking an unauthorized amount of water from Lake Michigan in the face of the institution of the Calumet River Suit in 1908 and the Main Channel Suit in 1913, and the limitations contained in the prior permits.

The contentions of the Bridge Company in regard to the *extent* of the obstruction were substantially the same as appellant's, as is shown by the following:

> But it is said, the bridge constitutes no serious obstruction to the navigation of the Ohio; that only seven steamboats of two hundred and thirty which ply upon the river as high as Pittsburgh are obstructed, and that arises from the height of their chimneys, which might be lowered at a small expense in passing under the bridge; that by the introduction of blowers the chimneys might be shortened without lessening the speed of the boats; that the goods and passengers which are conveyed on the public lines of communication, between Pittsburgh and Philadelphia, could be as well conveyed on boats of lower chimneys, and consequently the State, as proprietor of those lines, if at all injured, is injured so inconsiderably as not to lay the foundation of this procedure; that none of the packets or the other boats on the river are owned by the State of Pennsylvania (p. 568).

The same argument was made, too, that the theory of such cases as *Willson* v. *Black Bird Creek Marsh Company*, 2 Pet. 245, having to do with obstructions of *state* navigable waters should be applied, and that there was "no act of Congress prohibiting obstructions on the Ohio River." As a matter of fact the only Act of Congress was the sanctioning of a compact made by Virginia and Kentucky, at the time of the latter's admission into the Union, which compact was the same as that contained in Article IV of the Ordinance of 1787, the provisions of which were accepted and agreed to by the State of Illinois.

Other contentions of the appellant in the *Wheeling Bridge case*, which are echoed by appellant in this case, are summarized in the opinion as follows:

> That the bridge is a connecting link of a great public highway, as important as the navigation of the Ohio River; that Pennsylvania had set the example of authorizing bridges across the Ohio; that certain engineers of the United States had recommended a wire suspension bridge at Wheeling, and gave as their opinion that "by an elevation of ninety feet, every imaginable danger of obstructing the navigation would be avoided;" that certain reports of committees in Congress recognized the necessity of a bridge at Wheeling, and recommended an appropriation for that purpose; that the headway for steamers left by the bridge is amply sufficient, forty-seven feet above the water, for all useful purposes; and if sufficient draught can not be had at that height, blowers might be added; that chimneys might have hinges on them; so as to be lowered without much inconvenience; that the bridge will not be an appreciable inconvenience to the average class of boats; that the bridge will not diminish or destroy trade between Pittsburgh and other ports, or do irreparable injury to the citizens of Pennsylvania (p. 558).

This Court, in holding the *Wheeling Bridge* to be an unlawful obstruction, and in granting the injunctive relief prayed by the State of Pennsylvania, ruled against substantially every contention made by

the appellant in the present case. We quote portions of the opinion as follows:

> And this injury is of a character for which an action at law could afford no adequate redress. It is of daily occurrence, and would require numerous, if not daily prosecutions, for the wrong done; and from the nature of that wrong, the compensation could not be measured or ascertained with any degree of precision. The effect would be, if not to reduce the tolls on these lines of transportation, to prevent their increase with the increasing business of the country.
>
> If the obstruction complained of be an injury, it would be difficult to state a stronger case for the extraordinary interposition of a court of chancery. In no case could a remedy be more hopeless by an action at common law. The structure complained of is permanent, and so are the public works sought to be protected. The injury, if there be one, is as permanent as the work from which it proceeds and as are the works affected by it. And whatever injury there may now be, will become greater in proportion to the increase of population and the commercial developments of the country. And in a country like this, where there would seem to be no limit to its progress, the injury complained of would be far greater in its effects than under less prosperous circumstances (p. 562).
>
> * * * * *
>
> It is objected that there is no act of Congress prohibiting obstructions on the Ohio River, and

that until there shall be such a regulation, a state, in the construction of bridges, has a right to exercise its own discretion on the subject.

* * * * *

The case of *Wilson* v. *The Black Bird Creek Marsh Company*, 2 Pet. 250, is different in principle from the case before us. A dam was built over a creek to drain a marsh, required by the unhealthiness it produced. It was a small creek, made navigable by the flowing of the tide. The Chief Justice said it was a matter of doubt, whether the small creeks, which the tide makes navigable a short distance, are within the general commercial regulation; and that in such cases of doubt, it would be better for the court to follow the lead of Congress. Congress have led in regulating commerce on the Ohio, which brings the case within the rule above laid down. The facts of the two cases, therefore, instead of being alike, are altogether different.

No state law can hinder or obstruct the free use of a license granted under an Act of Congress. Nor can any state violate the compact, sanctioned as it has been by obstructing the navigation of the river. More than this is not necessary to give a civil remedy for an injury done by an obstruction (p. 566).

* * * * *

The fact that the bridge constitutes a nuisance is ascertained by measurement. The height of the bridge, of the water, and of the chimneys of steamboats, are the principal facts to be ascertained. If the obstruction

exists, it is a nuisance. To ascertain this a jury is not necessary. It is shown in the report, by a mathematical demonstration. And the other matters, connected with the case, as to the benefit of high chimneys, lowering of them in passing under the bridge, and shortening chimneys, are matters of science and experience, better ascertained by a report than by a verdict. And the same may be said of the statistics which are in the case (p. 568).

* * * * *

The Bridge Company had legal notice of the institution of the suit, and of the application for an injunction to stay their proceedings, before their cables were thrown across the river. This should have induced them to suspend, for a time, their great work, alike creditable to the enterprise of their citizens, and the genius and science of the engineer who planned the bridge and superintended its construction. It is a matter of regret that, by the prosecution and completion of the bridge, they have incurred a high responsibility.

For the reasons and facts stated, we think that the bridge obstructs the navigation of the Ohio, and that the State of Pennsylvania has been, and will be, injured in her public works in such manner as not only to authorize the bringing of this suit but to entitle her to the relief prayed (p. 578).

In view of the relief granted to the State of Pennsylvania in the *Wheeling Bridge case*, where the liti-

gants were in the situation of private individuals before this court, how much stronger is the right of the United States, relying upon its *paramount* and *exclusive* right of control of such subjects of interstate commerce as are national in character?

After the decision in the *Wheeling Bridge case*, "Congress in the exercise of its constitutional authority to regulate commerce, legalized the structure, by a legislative enactment" (*The Wheeling Bridge*, 18 How. 421). This Court, in holding that by reason of the act of Congress its previous decree could not be enforced, said (p. 430):

> So far, therefore, as this bridge created an obstruction to the free navigation of the river, in view of the previous acts of Congress, they are to be regarded and modified by this subsequent legislation; and although it still may be an obstruction in fact, is not so in the contemplation of law.

In *Newport and Cincinnati Bridge Co.* v. *United States*, 105 U. S. 470, a bridge across the Ohio River between Newport and Cincinnati had been authorized, both by an act of Congress and by acts of the Ohio and Kentucky Legislatures, which required the bridge company to comply with the regulations of Congress. Congress later withdrew its assent. The right of Congress to do this was upheld. This Court said:

> It can not be denied that but for the act of 1871 [16 Stat. at L., 573], a bridge built according to the original plan would have

> been a lawful structure which the Company could have maintained until Congress withdrew its assent, or required alterations to be made. The paramount power of regulating bridges that affect the navigation of the navigable waters of the United States is in Congress. It comes from the power to regulate commerce with foreign Nations and among the States.
>
> * * * * *
>
> That the Ohio is one of the navigable rivers of the United States must be conceded. It forms a boundary of six States and the commerce upon its waters is very large.
>
> No question can arise in this case upon what the States have done, for both Ohio and Kentucky required the Company to comply with the regulations of Congress.
>
> * * * * *
>
> We conclude that the withdrawal by Congress of its assent to the maintenance of the bridge, when properly made, is, for all the purposes of this case, equivalent to a positive enactment that from the time of such withdrawal the further maintenance of the bridge shall be unlawful, notwithstanding the legislation of the several States, upon the subject. If modifications are directed, assent is, in legal effect, withdrawn, unless the required changes are made. (Pp. 475–6, 479.)

In *Miller* v. *Mayor of New York*, 109 U. S. 385, was involved the lawfulness of the Brooklyn Bridge. In that case the facts showed that not only the authority of the New York Legislature but also of

Congress had been obtained. Because of its connection with Long Island Sound, the East River may be regarded as an interstate water.

In *Covington & Cincinnati Bridge Co.* v. *Kentucky*, 154 U. S. 204, this Court held that Kentucky had no power "to regulate tolls upon a bridge connecting it with another state, without the assent of Congress."

> The authority of the state, so frequently recognized by this court, to fix tolls for the use of wharves, piers, elevators, and improved channels of navigation, has always been limited to such as were exclusively within the territory of a single state, thus affecting interstate commerce but incidentally, and cannot be extended to structures connecting two states without involving a liability of controversies of a serious nature (p. 221).

In *Kansas City, S. R. Co.* v. *Kaw Valley Drainage Dist.*, 233 U. S. 75, the Kansas court, on petition of the Drainage District, had ordered the railroad company to remove its bridges across the Kansas River. It appeared that in 1903 the river had overflowed its banks, flooded a large part of Kansas City, Kansas, and caused great loss, and that the railroad company's bridges on account of their elevation had caused the river to overflow. Referring to the judgment of the Kansas court, this Court said (p. 78):

> They are out-and-out orders to remove bridges that are a necessary part of lines of commerce by rail among the states. But that subject matter is under the exclusive control of Congress and is not one that it has

> left to the states until there shall be further action on its part. The freedom from interference on the part of the states is not confined to a simple prohibition of laws impairing it, but extends to interference by any ultimate organ.

Further citation and analysis of cases bearing on this question would be superfluous. Fundamentally we are dealing with the same question which arose in *Gibbons* v. *Ogden*, 9 Wheat. 190, where it was held once and for all time that a state might not interfere with a subject of interstate navigation national in character, even by an act taking place within its own borders. Other familiar authorities to the same effect are *Brown* v. *Maryland*, 12 Wheat. 419; *Henderson* v. *Mayor of New York*, 92 U. S. 259; *Hall* v. *DeCuir*, 95 U. S. 485; *Lord* v. *Goodall, etc., Steamship Co.*, 102 U. S. 541; *Gloucester Ferry Co.* v. *Pennsylvania*, 114 U. S. 196; *Philadelphia & S. Mail S. S. Co.* v. *Pennsylvania*, 122 U. S. 326; and *Sault Ste. Marie* v. *International Transit Co.*, 234 U. S. 333.

Appellant, by diverting the equivalent of a large navigable river from a fork of the Chicago River, is creating a result which is national in scope. It is just as surely regulating what boats may navigate the St. Clair River and the other critical points of Great Lake Navigation and what boats may enter the various harbors and trade at the various docks as if it were enforcing a law forbidding boats of a certain draft from trading on the Great Lakes. While pretending to concede the power of Congress

to regulate, it nullifies the power by abstracting the thing to be regulated.

Returning, in conclusion, to the fundamental distinction which has been made by this Court between matters local and matters national in character, we submit that the subject of the levels of the Great Lakes does not *permit* of diversity of treatment according to the local requirements of cities on their shores. What Chicago can do so can Milwaukee, Toledo, and Cleveland. As was stated by this Court in the case of *Pennsylvania* v. *West Virginia*, 262 U. S. 553 (p. 596):

> The question is an important one; for what one state may do others may, and there are ten states from which natural gas is exported for consumption in other states.

That the subject will admit "only of one uniform system or plan of regulation" must be apparent from the fact that the depths of harbors, locks, and other improvements which have been and will be undertaken at great expense in the Great Lakes—whether by the United States, the state, or private individuals—necessarily depend on trustworthy calculations as to the depths of the lakes and on confidence that the levels will be maintained by a paramount authority. The matter can not be left to the conflicting requirements of local conditions.

D

Under the compact contained in article 4 of the ordinance of 1787, Illinois may not interfere with or decrease the navigable capacity of Lake Michigan or any of the other Great Lakes

To quote from the opinion of this Court in *Economy Light & Power Co.* v. *United States*, 256 U.S. 113, 118:

> The public interest in navigable streams of this character in Illinois and neighboring states, and the Federal authority over such as are capable of serving commerce among the states, does not arise from custom or implication, but has a very definite origin. By article 4 of the compact in the Ordinance of July 13, 1787, for the government of the territory northwest of the river Ohio, it was declared: "The navigable waters leading into the Mississippi and Saint Lawrence, and the carrying places between the same, shall be common highways, and forever free, as well to the inhabitants of the said territory as to the citizens of the United States, and those of any other states that may be admitted into the Confederacy, without any tax, impost, or duty therefor." (1 Stat. at L. 51, 52, note; U. S. Rev. Stat. 1878, ed. pp. 13, 16.)

The effect of this compact was held to be as follows:

> To the extent that it pertained to *internal affairs*, the Ordinance of 1787—notwithstanding its contractual form—was no more than a regulation of territory belonging to the United States, and was superseded by the admission of the state of Illinois into the

Union "on an equal footing with the original states in all respects whatever" (p. 120).

* * * * *

But, so far as it established public rights of highway in navigable waters capable of bearing commerce from state to state, it did not regulate internal affairs alone, and was no more capable of repeal by one of the states than any other regulation of interstate commerce enacted by the Congress, being analogous in this respect to legislation enacted under the exclusive power of Congress to regulate commerce with the Indian tribes. (p. 120).

In the *Wheeling Bridge Case*, 13 How. 518, 565–6 this Court gave the same interpretation to a similar compact between Virginia and Kentucky.

Congress have not declared in terms that a state, by the construction of bridges, or otherwise, shall not obstruct the navigation of the Ohio, but they have regulated navigation upon it, as before remarked, by licensing vessels, establishing ports of entry, imposing duties upon masters and other officers of boats, and inflicting severe penalties for neglect of those duties, by which damage to life or property has resulted. And they have expressly sanctioned the compact made by Virginia with Kentucky, at the time of its admission into the Union, "that the use and navigation of the River Ohio, so far as the territory of the proposed State, or the territory that shall remain within the limits of this Commonwealth lies thereon, shall be free and common to the citi-

> zens of the United States." Now, an obstructed navigation can not be said to be free.
>
> * * * * *
>
> This compact, by the sanction of Congress, has become a law of the Union. What further legislation can be desired for judicial action?

On the other hand, in such cases as *Escanaba & Lake Michigan Transportation Co.*, 107 U. S. 678; *Cardwell* v. *American River Bridge Co.*, 113 U. S. 205; *Huse* v. *Glover*, 119 U. S. 543; *Hamilton* v. *Vicksburg, Shreveport and Pacific R. R. Co.*, 119 U. S. 280; *Sands* v. *Manistee River Improvement Co.*, 123 U. S. 288; and *Willamette Iron Bridge Co.* v. *Hatch*, 125 U. S. 1, this court held the compact inapplicable to obstructions over navigable waters entirely within the boundaries of a single state.

We submit that the principle to be extracted from these cases is that where the obstruction or restriction of navigability is of a *state* navigable water, the compact does not apply; where it is of an *interstate* navigable water such as the Ohio River or the Great Lakes, the compact is, and has always been in force. It is true that the Economy Light & Power Co. case involved an obstruction to what was before 1890 a *state* navigable water (i. e., the Desplaines River); yet Congress had by its Acts of 1890 and 1899 extended its paramount control to such waters, and they had therefore become to that extent *interstate* navigable waters.

E

The subject of the levels of and diversion of waters from the Great Lakes is necessarily national because international in character and therefore subject to the exclusive control of Congress

Under our Point I we call attention to the decisions of this Court relating to the *international* character of those of the Great Lakes which are boundary waters. (Supra, pp. 125–128.) They have been held subject to admiralty jurisdiction (*The Propeller Genesee Chief*, 12 How. 443); they have been held to be "high seas" (*United States* v. *Rodgers*, 150 U. S. 249) and navigation on them was held not to constitute "inland navigation" (*Moore* v. *American Transportation Co.*, 24 How. 1). The matter of their levels has been held to be "of international consideration." (*United States* v. *Chandler-Dunbar Water Power Co.*, 229 U. S. 53.)

> These lakes are in truth inland seas. Different states border on them on one side, and a foreign nation on the other. A great and growing commerce is carried on upon them between different states and a foreign nation, which is subject to all the incidents and hazards that attend commerce on the ocean. (*The Propeller Genesee Chief*, 12 How. 443, 453.)

As was said by this Court in *Lord* v. *Goodall, etc., Steamship Co.*, 102 U. S. 541, (p. 544).

> Navigation on the high seas is necessarily national in its character. Such navigation is clearly a matter of "external concern" affecting the nation as a nation in its external affairs. It must therefore be subject to the national government.

In *Henderson* v. *Mayor of New York*, 92 U. S. 259, this Court held invalid a statute imposing onerous conditions upon the master of every vessel arriving in the Port of New York from foreign ports or other states. We quote from the opinion (p. 273):

> A regulation which imposes onerous, perhaps impossible, conditions on those engaged in active commerce with foreign nations must of necessity be national in its character. It is more than this; for it may properly be called "international." It belongs to that class of laws which concern the exterior relation of this whole nation with other nations and governments. If our government should make the restrictions of these burdens on commerce the subject of a treaty, there could be no doubt that such a treaty would fall within the power conferred on the President and the Senate by the Constitution. It is, in fact, in an eminent degree, a subject which concerns our international relations, in regard to which foreign nations ought to be considered and their rights respected, whether the rule be established by treaty or by legislation.
>
> It is equally clear that the matter of these statutes may be and ought to be the subject of a uniform system or plan.

In this connection we call attention to the following discussion of the specific subject under consideration (i. e., diversions of international waters) in the recent work of Charles Cheney Hyde on International Law:

> The diversion of the waters of an international stream for any purposes, such as those

of sanitation, navigation, power or irrigation, tends to interfere with the fullest use of the river by all riparian proprietors. There may be said to be an essential conflict between the interest of the stream as a whole, and that of the particular State diverting its waters. Where a river traverses or serves as the boundary of the territories of several States, the existence of the river interest, as such, becomes the more apparent, because of the common concern of all in its welfare.

* * * * *

In the case of a navigable river a special element projects itself which at once opposes any unrestricted taking of water serving to diminish the depth of channels of navigation and thus to impair their value. Any duty imposed upon a riparian State, either by international law or by contract, to maintain the navigability of an international river, implies an obligation also to check within places subject to the control of such State the commission of any acts which, unless restricted, would prove injurious to navigation generally. This obligation would seem to render improper the tolerance of any diversion productive of such an effect even though it should occur at a point where the river ceased to be navigable and lay wholly within the domain of the acquiescent territorial sovereign. (Vol. I, pp. 313–316.)

The international character of the appellant's proposed diversion of water has been understood and emphasized frequently by the officers of the United

States familiar with the matter. (See Appellant's Narrative, 469–471.) It was emphasized in the Report of the Board of Engineers on August 16, 1895. (Rec. Vol. VI, pp. 3931–3940.) It was mentioned by Major Marshall in his report to the Chief of Engineers on April 24, 1899 (Rec. Vol. VI, p. 3586), before the appellant was given its first permit to divert water. In the ruling of the Secretary of War on March 14, 1907, in which he refused appellant's application for a permit to reverse the flow of the Calumet River and divert water from Lake Michigan through it, the Secretary of War stated:

> Added to this, is the international complication which is likely to arise in the threatened lowering of the lake level in the ports and harbors and canals of Canada * * * It may be fortunate that circumstances now require submission of this question of capital and national importance to the Congress of the United States. (Rec. Vol. VII, p. 25.)

In the decision of the Secretary of War of January 8, 1913, denying appellant's application for an increased diversion, he stated:

> The question therefore becomes not merely national but international. (Rec. Vol. VII, pp. 7–17; Appellant's Narrative, p. 36.)

This view of the Secretary of War had an ample basis in the hearing which had taken place before him, for representatives of a foreign government and of foreign interests were strenuously opposing the appellant's application and made an imposing showing of serious injury to their interests.

Finally and, we submit, conclusively, the President of the United States and Congress have recognized the question as having an international character, affecting the United States in its external relations, by participating in the creation, organization, investigations and reports of the International Waterway Commission, and by negotiating and entering into the Canadian Boundary Waters Treaty of January 11, 1909. We discuss the provisions of this treaty elsewhere (infra, pp. 226, 305) and shall not dwell on them here. That treaty, we believe, just as certainly and effectively as a positive act of Congress, forbids the unauthorized diversion of waters by the appellant, and even permits the Canadian Government to complain of the authorized diversion of 4167 c. s. f. if it should prove injurious to navigation on the Canadian side of the boundary waters. The treaty, also, by its prohibition of the placing of submerged weirs and dams as compensating works without the approval of the International Joint Commission, an international tribunal, manifests the absurdity of appellant's contention that it should receive a *permit* from the Federal *judiciary* to take 10,000 c. s. f. on condition that it pay for the construction and maintenance of such weirs.

III

Whatever may have been the case prior to 1890, Congress assumed control of the subject of obstructions to the navigable capacity, and modifications of the course, condition, and capacity, of all navigable waters of the United States by its act of September 19, 1890, and even more extensively by its act of March 3, 1899.

Whether or not, in the absence of an assertion of its paramount control by Congress, the appellant might lawfully have obstructed the navigable capacity of the Great Lakes, such an assertion of control *was* made in unmistakable terms by the Acts of Congress of September 19, 1890 (26 St. at L. 454), and of March 3, 1899 (30 St. at L. 1151). Inasmuch as the provisions of the Act of 1890, though partially repealed by the Act of 1899, throw some light on the meaning and scope of the later statute, we shall first set forth the applicable portions of the Act of 1890.

Section 7 of the Act of 1890 provided in part:

> It shall not be lawful hereafter * * * to excavate or fill, or in any manner to alter or modify the course, location, condition or capacity of the channel of said navigable water of the United States, unless approved and authorized by the Secretary of War.

Section 10 of the Act of 1890 provided in part:

> That the creation of any obstruction, not affirmatively authorized *by law*, to the navigable capacity of any waters, in respect of which the United States has jurisdiction, is hereby prohibited.

The Ninth Circuit Court of Appeals in *United States* v. *Bellingham Bay Boom Co.*, 81 Fed. 658 (affirming same case, 72 Fed. 585, and later affirmed by this Court; 176 U. S. 211), held that the words "affirmatively authorized by law" in Section 10 of the Act of 1890 included authorization by a state legislature where the navigable water was wholly within the boundaries of the state. Thereupon the Act of 1899 was passed, Section 10 of which replaced the above-quoted portions of Sections 7 and 10 of the Act of 1890, as follows:

> That the creation of any obstruction not affirmatively authorized *by Congress*, to the navigable capacity of any of the waters of the United States is hereby prohibited; and * * * it shall not be lawful to excavate or fill, or in any manner to alter or modify the course, location, condition, or capacity of, any port, roadstead, haven, harbor, canal, lake, harbor of refuge, or enclosure within the limits of any breakwater, or of the channel of any navigable water of the United States, unless the work has been recommended by the Chief of Engineers and authorized by the Secretary of War prior to beginning the same.

It would seem that a mere reading of the above-quoted statutory provisions is all that is necessary to demonstrate that the appellant's acts were in violation of the Act of 1899 and would have been in violation of the Act of 1890 if that act were in force. In this connection, it should be remembered that prior to the enactment on March 3 of the Act of 1899 appel-

lant had done nothing affecting in the slightest any navigable waters of the United States except the accomplishing of certain improvements in the Chicago River. These improvements were made under permits of the Secretary of War expressly reciting:

> That this authority shall not be interpreted as approval of the plans of the Sanitary District of Chicago to introduce a current into Chicago River. This latter proposition must hereafter be submitted for consideration. (Appellant's Narrative, p. 474; Rec. Vol. VIII, p. 122.)

The mere excavation of a ditch in the interior of a state is of no concern to the Federal Government. The diversion of water by appellant, so far as it was lawful, was under the permit of May 8, 1899, and was not accomplished until January 17, 1900. Until January 17, 1900, therefore, the appellant did nothing affecting either the navigable capacity, the location, the condition, or the course of any navigable water of the United States. Its acts must be judged under the provisions of the Act of 1899.

Can there be any doubt that *since* the enactment of the Act of 1899—

(1) The appellant has created an obstruction to the navigable capacity of navigable waters of the United States—

(*a*) By lowering the levels of the Great Lakes, their connecting waters, and the St. Lawrence River.

(*b*) By introducing into the Chicago River an unduly rapid current, dangerous to navigation.

(2) The appellant has modified the course, location, condition, and capacity of navigable waters of the United States—

(*a*) By lowering the levels of the Great Lakes, their connecting waters, and the St. Lawrence River, whether or not the lowering be sufficient to obstruct.

(*b*) By introducing into the Chicago River an increased current, whether or not it be dangerous to navigation.

(*c*) By diverting into the Mississippi Basin waters which would naturally flow into the St. Lawrence basin.

(*d*) By increasing the amount of water flowing down the Desplaines, Illinois, and Mississippi Rivers.

(*e*) By reversing the course of the Calumet River.

Even if this Court should be of the opinion that the lowering of the Great Lakes by several inches and the increased current in the Chicago River do not constitute *obstructions* within the meaning of the first clause of Section 10, they, and the other acts above listed under (2), constitute violations of the last clause of that section.

Nor, as a matter of fact, is there room for doubt that if the applicable provisions of the Act of 1890 were in force, the appellant would be violating those provisions. (1) Appellant would be violating Section 10 of that Act forbidding obstructions. The construction given by this Court to the words "affirmatively authorized by law" does not assist appellant, for a state legislature never had the power or right to authorise obstructions to waters like Lake Michigan, not wholly within the state's boundaries.

(2) Appellant would be violating Section 7 of that Act forbidding modifications of the condition, etc., of navigable waters. No exception was made in Section 7 for acts authorized by state legislatures; in *every* case the approval and authorization of the Secretary of War was required.

Although the statutes themselves seem to us to answer every contention made by appellant, we shall nevertheless review the decisions bearing on the interpretation and application of these statutes. We shall reserve for separate consideration in our Point IV certain particular points made by appellant as to whether the acts of appellant created an *obstruction* or a *modification;* in our Points V and VI we shall meet the claim of appellant that its acts *have* been authorized by Congress and the Secretary of War.

A

In all decisions on the subject prior to these acts of Congress, even where the State's act was upheld as a legitimate exercise of its police power, this court has expressly recognized that when Congress should see fit to act the authority of the State came to an end

Under subheadings B and C of our Point II (supra, pp. 35 to 136) we have discussed in another connection the long line of cases beginning with *Willson* v. *Black Bird Creek Marsh Company*, 2 Pet. 245, which, in the absence of legislation by Congress, upheld the power of the State to create certain obstructions to the navigable capacity of navigable waters entirely within their boundaries and to regulate purely local matters in their ports on interstate navigable waters. The purposes for which the States might formerly exercise this limited power were varied

but in a general way they all came within the scope of the police power. In some cases it was for the protection of public health (*Willson* v. *Black Bird Creek Marsh Company*, 2 Pet. 245; *Morgan's, etc., Co.* v. *Louisiana Board of Health*, 118 U. S. 455); in some cases it was for furthering of commerce in saw-logs, etc. (*Pound* v. *Turck*, 95 U. S. 459); in some cases it was for improvement of rivers or harbors (*Mobile County* v. *Kimball*, 102 U. S. 691; *Sands* v. *Manistee River Improvement Co.*, 123 U. S. 288); in some cases it was for public convenience and commerce crossing a bridge (*Gilman* v. *Philadelphia*, 3 Wall. 724; *Escanaba & Lake Michigan Transportation Co.* v. *Chicago*, 107 U. S. 683). We know of no case in which the object of the State's act, if held lawful, was not referable to its police power.

In *every* such case, in *express* language, a reservation was made: when Congress saw fit to legislate on the subject the authority of the State ceased, and any act, by legislation or by any ultimate organ, in conflict with the assertion of control by Congress, would be void and unlawful.

B

By its acts of 1890 and 1899 Congress made an effectual assertion of its paramount control over all navigable waters of the United States and assumed jurisdiction of the subjects mentioned in the above heading

In *United States* v. *Rio Grande Dam & Irrigation Co. et al.*, 174 U. S. 690 (reversing 51 Pac. 674), this court, speaking through Mr. Justice Brewer, said (p. 703):

> It is true there have been frequent decisions recognizing the power of the state in the ab-

sence of congressional legislation to assume control of even navigable waters within its limits to the extent of creating dams, booms, bridges, and other matters which operate as obstructions to navigability. The power of the state to thus legislate for the interests of its own citizens is conceded, and until in some way Congress asserts its superior power and the necessity of preserving the general interests of the people of all the states, it is assumed that state action, although involving temporarily an obstruction to the free navigability of a stream, is not subject to challenge. A long list of cases to this effect can be found in the reports of this court. See, among others, the following: *Wilson* v. *Black Bird Creek Marsh Co.*, 2 Pet. 245; *Gilman* v. *Philadelphia*, 3 Wall. 713; *Escanaba Co.* v. *Chicago*, 107 U. S. 678; *Willamette Iron Bridge Co.* v. *Hatch*, 125 U. S. 1.

After discussing certain Acts of Congress (14 St. at L. 253, Chap. 262 and 26 St. at L. 1101), the court said (p. 707):

> But whatever may be said as to the true intent and scope of these various statutes, we have before us the legislation of 1890. On September 19, 1890, an act was passed containing this provision (26 Stat. at L. 454, sec. 10).

The court then quotes Sec. 10 and proceeds (pp. 707-708):

> As this is a later declaration of Congress, so far as it modifies any privileges or rights conferred by prior statutes, it must be held controlling, at least as to any rights attempted to be created since its passage; and all the pro-

ceedings of the appellees in this case were subsequent to this act. This act declares that "the creation of any obstruction, not affirmatively authorized by law, to the navigable capacity of any waters in respect to which the United States has jurisdiction, is hereby prohibited." Whatever may be said in reference to obstructions existing at the time of the passage of the act, under the authority of state statutes, it is obvious that Congress meant that thereafter no state should interfere with the navigability of a stream without the condition of national assent. It did not, of course, disturb any of the provisions of prior statutes in respect to the mere appropriation of water of non-navigable streams in disregard of the old common-law rule of continuous flow, and its only purpose, as is obvious, was to affirm that as to navigable waters nothing should be done to obstruct their navigability without the assent of the national government. It was an exercise by Congress of the power, oftentimes declared by this court to belong to it, of national control over navigable streams, and various sections of this statute, as well as in the act of July 13, 1892 (27 Stat. at L. 88, 110), provide for the mode of asserting that control. It is urged that the true construction of this act limits its applicability to obstructions in the navigable portion of a navigable stream, and that as it appears that although the Rio Grande may be navigable for a certain distance above its mouth, it is not navigable in the territory of New Mexico, this statute has no applicability. The lan-

guage is general, and must be given full scope. It is not a prohibition of any obstruction to the navigation, but any obstruction to the navigable capacity; and anything, wherever done or however done, within the limits of the jurisdiction of the United States, which tends to destroy the navigable capacity of one of the navigable waters of the United States, is within the terms of the prohibition. Evidently Congress perceiving that the time had come when the growing interests of commerce required that the navigable waters of the United States should be subjected to the direct control of the national government, and that nothing should be done by any State tending to destroy that navigability without the explicit assent of the national government, enacted the statute in question. And it would be to improperly ignore the scope of this language to limit it to the acts done within the very limits of navigation of a navigable stream.

See also *Lake Shore & Michigan Southern Ry. Co.* v. *Ohio*, 165 U. S. 365; *United States* v. *Bellingham Bay Boom Co.*, 176 U. S. 211; *Cummings* v. *Chicago*, 188 U. S. 410; *Union Bridge Co.* v. *United States*, 204 U. S. 364; *Philadelphia Co.* v. *Stimson, Secretary of War*, 223 U. S. 605; *United States* v. *Chandler-Dunbar Water Power Co.*, 229 U. S. 53.

In *Economy Light & Power Co.* v. *United States*, 256 U. S. 113 (affirming 256 Fed. 792), this court said:

> But, as was recognized in the *Gilman case* [*Gilman* v. *Philadelphia*, 3 Wall. 731], Congress may exercise its authority through general as well as through special laws, its power

> in either case being supreme. The Act of 1899 * * * is a due assertion of the authority of Congress over all navigable waters within its jurisdiction; and it must be accorded due weight as such (p. 121).

In *Southern Pacific Company et al.* v. *Olympian Dredging Company*, 260 U. S. 205, 207–208 this court said:

> By the Act of September 19, 1890 (26 Stat. at L. 453, 454, chap. 907), Congress inaugurated a new policy of general, direct control over the navigable waters of the United States.
>
> * * * * *
>
> By this legislation Congress assumed jurisdiction of the subject of obstructions to navigation, and committed to the Secretary of War administrative power in so far as administration was necessary.

No point is made by appellant as to the constitutionality of these Acts of Congress. Any possible contention that there has been an undue delegation of power to the Secretary of War is effectively met by the decisions of this Court in such cases as *Union Bridge Co.* v. *United States*, 204 U. S. 364; *Philadelphia Co.* v. *Stimson, Secretary of War*, 223 U. S. 605.

C

The effect of Section 10 of the Act of 1899 is to make the creation of such obstructions or modifications dependent "upon the concurrent or joint assent of both the national Government and the State government"

We have already pointed out the interpretation given by this Court to the words "affirmatively authorized by law" as they appear in Section 10 of the Act of 1890 in *United States* v. *Bellingham Bay Boom Co.*, 176 U. S. 211 (supra, p. 193). The same

interpretation was given the words as they appeared in another section of the Act of 1890 in *Lake Shore & Michigan Southern R. Co.* v. *Ohio*, 165 U. S. 365. Incidentally, it may be noted that in the *Bellingham Bay Boom Co. case*, this Court held the obstruction unlawful, for the evidence showed that it was not even authorized by the Act of the Oregon Legislature. That the words "affirmatively authorized by law" did not cover obstructions caused within the state but affecting navigable capacity of waters outside the state is clear from the opinion of this Court in *United States* v. *Rio Grande Dam & Irrigation Co.*, 174 U. S. 698. In that case, which arose under Section 10 of the Act of 1890, the unlawful act consisted of diverting the water of a *nonnavigable* river in the Territory of New Mexico with a harmful result to the navigable capacity of that river in its navigable portion *outside* the Territory. The fact that New Mexico was not a state is immaterial; the act of its legislature was just as lawful or unlawful as authorization for the dam.

There is, therefore, no doubt as to the meaning and intent of the words "affirmatively authorized by Congress" as they appear in Section 10, of the Act of 1899. An act of the state legislature can not authorize an obstruction to the navigable capacity of a navigable water of the United States whether within or without the boundaries of the state. There must be Federal authority. That it must be an *Act* of Congress in the case of an obstruction, and not

merely the authorization of the Secretary of War, is shown under our next subheading.

The question then arose in *Cummings* v. *Chicago*, 188 U. S. 410, as to whether the words "affirmatively authorized by Congress" in Section 10 of the Act of 1899 were intended (p. 428)—

> to supersede, for every purpose, the authority of Illinois over the erection of structures in navigable waters wholly within its limits? Did it intend to declare * * * that the assent of the Secretary of War, proceeding under the above acts of Congress, was alone sufficient to authorize such structures?

In that case Cummings, having obtained the recommendation of the Chief of Engineers and a permit from the Secretary of War, proceeded to construct a dock in the Calumet River. An ordinance of the City of Chicago, enacted under power duly delegated it by the Illinois Legislature, required the permission of its department of public works as a condition precedent to the construction of any dock within the limits of the city. This Court, in holding that the state's authority had not been superseded to that extent, said (pp. 430–31):

> But we will not at this time make any declaration of opinion * * * as to the extent to which Congress may go in the matter of the erection or authorizing the erection of docks and like structures in navigable waters that are entirely within the territorial limits of the several states. Whether Congress may, against or without the expressed will of a state, give

affirmative authority to private parties to erect structures in such waters, it is not necessary in this case to decide. It is only necessary to say that the act of 1899 does not manifest the purpose of Congress to go to that extent under the power to regulate foreign and interstate commerce and thereby to supersede the original authority of the states. *The effect, of that Act, reasonably interpreted, is to make the erection of a structure in a navigable river, within the limits of a state, depend upon the concurrent or joint assent of both the national government and the state government.* The Secretary of War, acting under the authority conferred by Congress, may assent to the erection by private parties of such a structure. Without such assent the structure can not be erected by them. But under existing legislation they must, before proceeding under such an authority, obtain also the assent of the state acting by its constituted agencies.

Montgomery v. *Portland*, 190 U. S. 89, involved an identical situation with regard to the Willamette River in Oregon, and, in the words of the opinion, "this case can not be distinguished in principle from *Cummings* v. *Chicago*." A third case applying the same principles is *North Shore Boom & Driving Company* v. *Nicomen Boom Company*, 212 U. S. 406, involving the lawfulness of a boom in the North River, a river wholly within the boundary of the state of Washington. The boom was in violation of the laws of Washington; it did not appear whether or not the Boom Company had complied with the Federal stat-

ute. This Court, after quoting the first portion of Section 10 of the Act of 1899, said (p. 413):

> It leaves out the words "not affirmatively authorized by law," and substitutes "not affirmatively authorized by Congress." There is, therefore, no reference to state action or state law. Obstruction not affirmatively authorized by Congress is prohibited, but the case of the state assent remains with the state for its sole adjudication.
>
> The construction of the boom of defendant in this case, the state court has decided, was not authorized by the state. Whether it was or not is not a Federal question.

A further application of the same principle is found in *Port of Seattle* v. *Oregon & Washington R. Co.*, 255 U. S. 56, in which this Court said (pp. 69–70):

> So far as the pierhead lines are concerned, the railroad concedes that their establishment by the United States did not create, as against the state, a right to wharf out. They merely fixed the line beyond which piers might not extend. * * * And the power of the United States in this respect was not exhausted by its first exercise. [Citing *Philadelphia Co.* v. *Stimson*, 223 U. S. 605.] The lines so fixed, although acted upon by the erection of piers, could be changed by the United States at any time. [Citing *Greenleaf Johnson Lumber Co.* v. *Garrison*, 237 U. S. 251.]

The case of *International Bridge Co.* v. *New York*, 254 U. S. 126, involves a very different situation. The bridge was erected in 1874, under authority of an

Act of Congress, between Squaw Island in the Niagara River and the mainland of New York State. The state of New York brought suit against the Bridge Company to recover penalties for failure to place upon the bridge a roadway for vehicles and a pathway for pedestrians. This Court said (p. 132):

> The part of the structure with which we are concerned is within the territorial jurisdiction of the state of New York. There was no exercise of the power of eminent domain by the United States. The state was the source of every title to that land, and, apart from the special purposes to which it might be destined, of every right to use it. Any structure upon it, considered merely as a structure, is erected by the authority of New York.

The case had nothing to do with the bridge as an obstruction of the navigable capacity of the Niagara River.

What encouragement appellant can extract from any of these cases is beyond our comprehension. *None* of them holds that state authority alone is sufficient for the creation of an obstruction or a modification of the condition of a navigable water of the United States. All of them have expressly held that Federal assent, either by Act of Congress or authorization from the Secretary of War (depending on the character of the proposed act) is a necessary condition precedent. Why cases such as *Cummings* v. *Chicago* should have been cited to any other effect we are unable to understand.

D

Under Section 10 of the act of 1899 an act of Congress is necessary to authorize the creation of an obstruction to the navigable capacity of a navigable water of the United States; for a modification of the condition, etc., of such navigable water, not amounting to an obstruction, the recommendation of the Chief of Engineers and the authorization of the Secretary of War is necessary

Apparently counsel for appellant contend that, in the face of the seemingly explicit language of Section 10 of the Act of 1899, an act of Congress is not necessary to authorize the creation of an obstruction to the navigable capacity of a navigable water of the United States; that power has been delegated to the Secretary of War to authorize any and all manner of obstructions, and that all that is necessary to legalize an obstruction is a permit from him following a recommendation by the Chief of Engineers. (See Appellant's Brief, Point II, particularly pp. 131–139.)

What advantage this surprising contention, even if tenable, would bring to appellant is hard to understand, for appellant has never had either the recommendation of the Chief of Engineers or a permit from the Secretary of War to divert more than a limited amount of water, which, since March 31, 1903, has been a maximum of 4,167 c. s. f. Appellant is, of course, arguing that certain permits granted it for the making of improvements in the Chicago River are permits to take 10,000 c. s. f. and, indeed, an unlimited amount of water. This is in spite of express recitals in those permits negativing any such interpretation. This we shall discuss in our Point VI, however. (Infra, pp. 241–242.)

We submit that, without doing shocking violence both to the English language and to fundamental rules of grammar and syntax, the applicable portions of Section 10 can be read to mean only the following:

> (1) The creation of any obstruction to the navigable capacity of a navigable water of the United States must be affirmatively authorized by Congress; e. g., there must be an act of Congress, general or special, authorizing the obstruction.
>
> (2) A modification of the course, location, condition, or capacity of any navigable water of the United States, when *not* amounting to an obstruction, must, to be lawful, be recommended by the Chief of Engineers and authorized by the Secretary of War.

A bridge or any other structure may or may not be an obstruction. An example of this is the *Wheeling Bridge case*, 13 How. 518. With its span at ninety feet the bridge was held to be an obstruction; the Bridge Company was directed by decree of this Court to elevate it to one hundred and eleven feet, a height at which it would not be an obstruction. There can be no doubt, however, but that Federal assent would be necessary to construct such a bridge, no matter how high, under existing legislation.

So with a modification of the condition or capacity of a navigable water. A lowering of the lake levels of five inches may, and under the evidence in this case does, amount to an obstruction. A lesser lowering such as would be caused by the authorized diversion of 4,167 c. s. f. might not be enough to constitute

an obstruction. Both situations are covered by Section 10, the one requiring an act of Congress and the other requiring *at least* the recommendation of the Chief of Engineers and the authorization of the Secretary of War. As a matter of fact, Congress has power to declare all modifications to be obstructions. (See cases cited under our next subheading, pp. 214 to 217.) Whether or not it has done so by Section 10, however, it is unnecessary to decide.

The interpretation we have placed upon the statute was given expression in *Hubbard* v. *Fort*, 188 Fed. 987, in which the Circuit Court in the District of New Jersey said (pp. 992–993):

> So far as applicable to the present question, such section (10) may be summarized thus: First, the creation of any *obstruction* to the navigable capacity of any waters of the United States is prohibited unless affirmatively authorized by Congress; second, it shall not be lawful to build any *structure* in a navigable river or water of the United States, except on *plans recommended* by the Chief of Engineers and *authorized* by the Secretary of War; and, third, it shall not be lawful to excavate or fill the channel of any navigable water of the United States unless such work is recommended by said Secretary of War prior to beginning the same. [If literally exact, the last clause should have read "recommended by the Chief of Engineers and authorized by the Secretary."]

The case of *West Chicago Street Ry. Co.* v. *Illinois, etc.*, 201 U. S. 506, declared a specific permit from the Secretary unnecessary only because the act (30 Stat. 1153) provided that a specific improvement of the Chicago River, involved in that case, should be at the expense of the city, and this provision of the statute was held an implied permit by Congress for this specific work, dispensing with the necessity of further authority from the Secretary under Section 10 of the act (p. 527).

The construction we contend for is supported by considerations drawn from other sections of the Act of 1899 and by the interpretation given by this Court to the Act of 1890. We do not pretend to understand just what message is intended to be conveyed by appellant's elaborate dissection of the two statutes. (Appellant's Brief, pp. 133–136.) It does not require much discernment, however, to discover that counsel for appellant have taken desperate liberties with the facts of the instant case in an endeavor to bring them within the views apparently held by the Supreme Court of Maine in *Maine Water Company* v. *Knickerbocker Steam Towage Company*, 99 Me. 473, 59 Atl. 953. For example, counsel say (Appellant's Brief, pp. 131–2):

> Excavating and filling in the channels of the Chicago River and its branches was the *only* work appellant was required to do in navigable waters of the United States to accomplish and bring about the diversion. The reversal of the current and flow of the

> Chicago River and its branches was a *necessary* result. * * * That includes, of course, the diversion of water *to the amount required by state authority*.

We hardly know whether to take such statements seriously or not. Are we to understand that the Chicago River simply flowed into the Sanitary & Ship Canal without the assistance of the appellant, as the necessary result of improvements made by it in the Chicago River under permits that expressly stated that they did not confer authority to divert water? Or that later permits to widen and otherwise improve the river automatically sent a current into the canal at the rate of 20,000 cubic feet per minute per 100,000 population in the district ("the amount required by state authority")? Has appellant, then, no control over the amount it is diverting? The absurdity of such a contention is self-evident.

We take the liberty of quoting further from the well-reasoned opinion in the case of *Hubbard* v. *Fort*, *supra*, in the absence of any decision of this Court having to do with the interpretation of Section 10 in this regard:

> And how can it be said that the structures or the works subsequently referred to in this section may not amount to an obstruction to such navigable capacity? It is to be noted that "excavate or fill" is associated with "alter or modify the course, location, condition, or capacity of any" navigable water, all of which

may be so performed as to become serious obstructions to navigation. That such obstructions may be but slight, and that some will be of only temporary duration, would not make them any less obstructions and within the prohibition. Any less comprehensive interpretation of the first part of section 10 would do violence to its language and, as already said, be meaningless. If Congress intended that as to all other obstructions not prohibited by section 9 no affirmative action by Congress should be necessary, but that they might be constructed upon obtaining the permission of the Secretary of War it used singularly inapt and ambiguous language in expressing such intention.

* * * * *

As the law stood immediately before the act of 1899 was passed, the initial authorization of the Congress to create obstructions to the navigable capacity of an intrastate water was not necessary if state legislative authority for such construction had been obtained, and the building of wharves and other structures mentioned in the first part of section 7 of the act of 1890, in any United States navigable water, was only prohibited without the permission of the Secretary of War, if they obstructed or impaired navigation, commerce, or anchorage. The erection of bridges and their appurtenances over intrastate waters was permitted without the need of the approval of the Secretary of War, if authorized by law before the passage of said act. The excavating, filling, altering, etc., the channel

of navigable waters was permitted if approved and authorized by the Secretary of War.

Among the changes effected by the act of 1899 was to require the affirmative authorization by Congress to create any obstruction to the navigable waters of the United States, except that bridges, dams, dikes, and causeways in or across waters the navigable portions of which lie wholly within the limits of a single state were permitted if authorized by state legislation and the location and plans of such structure were approved by the chief of engineers and by the Secretary of War. Perhaps without the change from "authorized by law" to "authorized by Congress" no obstruction to the navigable capacity of interstate waters without affirmative congressional enactment would have been lawful, but a present reading of the law in the light of the history of its enactment clearly evinces to my mind a legislative purpose to require affirmative action on the part of Congress before such a crossing of interstate streams as contemplated by complainants in this suit shall be permitted, and that only when such congressional action shall have been taken can the powers delegated to the Secretary of War be put into operation. (188 Fed. 996–7, 998–9.)

The fallacy of the reasoning of the Supreme Court of Maine lies in its omission to consider that in the Act of September 19, 1890, the effect of the combined provisions of sections 7 and 10 gave the same result that it thought could not have been intended in the

later statute. The structures covered by section 7 of the earlier act could be authorized by the Secretary of War *if* they did not constitute obstructions. If they did, they were forbidden by Section 10 unless "affirmatively authorized by law." The conclusion of the Maine court disregards the word "affirmatively" and renders it meaningless; indeed, the result is the substitution of the word "impliedly."

E

Whether the entire navigable capacity, and whether the unmodified condition of a navigable water should be conserved for the use and safety of navigation, are questions legislative in character, and the determination of these questions by Congress is conclusive

By Section 10 of the Act of 1899 (as well as by the corresponding provisions in Sections 7 and 10 of the Act of 1890), Congress has made unlawful, not only the creation of *obstructions* to navigable capacity, but also any modification of "the course, location, condition, or capacity of any * * * navigable water of the United States." The latter may or may not actually amount to *obstructions*. That Congress has power to exercise its paramount control to this extent, and that its determination as to the extent of the exercise is conclusive, is, we submit, not open to question.

In *United States* v. *Chandler-Dunbar Water Power Co.*, 229 U. S. 53, this Court, speaking of the power of Congress over interstate commerce, said (p. 62):

> It includes navigation and subjects every navigable river to the control of Congress. All means having some positive relation to

the end in view which are not forbidden by some other provision of the Constitution are admissible.

This Court further said (pp. 64, 65, 70):

> So unfettered is this control of Congress over the navigable streams of the country that its judgment as to whether a construction in or over such a river is or is not an obstacle and a hindrance to navigation is conclusive. Such judgment and determination is the exercise of legislative power in respect of a subject wholly within its control.
>
> * * * * *
>
> *The conclusion to be drawn is, that the question of* * * * *whether the whole flow of the stream should be conserved for the use and safety of navigation, are questions legislative in character,* and when Congress determined, as it did by the act of March 3, 1909, that the whole river between the American bank and the international line * * * was "necessary for the purposes of navigation of said waters and the waters connected therewith," *that determination was conclusive.*
>
> * * * * *
>
> It is for Congress to decide what is and what is not an obstruction to navigation.

In *Southern Pacific Company et al.* v. *Olympian Dredging Company*, 260 U. S. 205, this Court speaking of the Acts of 1890 and 1899, quoted with approval language from the opinion in *Monongahela Bridge Co.* v. *United States*, 216 U. S. 177 (see *infra*, p. 189) to the same effect.

In *Philadelphia Co.* v. *Stimson*, 223 U. S. 605, this Court said (pp. 635, 638):

> When the state of Pennsylvania established harbor lines and thus undertook to regulate the rights of navigation, its action, however effective as between the state and the riparian proprietors, was necessarily subject to the paramount power of Congress. The state lines can be conceded no permanent force, as against the will of Congress, without substituting for its constitutional authority the supremacy of the state with respect to navigable waters.
>
> It is for Congress to decide what shall or shall not be deemed in judgment of law an obstruction of navigation. *Pennsylvania* v. *Wheeling & B. Bridge Co.*, 18 How. 421. And in its regulation of commerce it may establish harbor lines or limits beyond which deposits shall not be made or structures built in the navigable waters. The principles applicable to this case have been repeatedly stated in recent decisions of this court.
>
> * * * * *
>
> It must be concluded, therefore, that it was competent for Congress to provide for the establishment of the harbor lines in question for the protection of the harbor of Pittsburgh. It acted within its constitutional power in authorizing the Secretary of War to fix the lines.

See also *Wheeling Bridge case* (second case), 18 How. 421; *Union Bridge Co.* v. *United States*, 204 U. S. 364; *Gibson* v. *United States*, 166 U. S. 269; *Scranton* v. *Wheeler*, 179 U. S. 141; *Chicago, B. &*

Q. R. Co. v. *Illinois*, 200 U. S. 561; *West Chicago Street R. Co.* v. *Illinois*, 201 U. S. 506; *Hannibal Bridge Co.* v. *United States*, 221 U. S. 194.

The vice of appellant's contention is that it attempts to place upon the already overburdened court a heavy burden which is not justiciable but political in nature. It asks the court to usurp the political function of Congress to determine the legislative policies of the Government.

F

Congress has committed to the Secretary of War and the Chief of Engineers the administrative duty of determining whether a modification of the condition, etc., of navigable waters is such that they can approve or whether it amounts to an obstruction requiring affirmative authorization from Congress; the determination of those questions by the Secretary of War and the Chief of Engineers is conclusive

It will be recalled that at the very outset, in granting the permit of May 8, 1899, the Secretary of War entertained grave doubt as to his power to authorize the diversion of water by appellant. This was the reason for the incorporation of the first condition in that permit, namely, that it should "be subject to such action as may be taken by Congress." The report of Major Marshall, United States Engineer at Chicago, to the Chief of Engineers of the United States, on April 24, 1899 (Rec. Vol. VI, p. 3586), confirms this and shows that the basis for the doubt was the effect of the diversion on the levels of the Great Lakes. The Chief of Engineers and the Secretary of War came to the conclusion that since the lowering from a diversion of 300,000 cubic feet per minute would not exceed three inches, they might

hazard a consent *subject* to the action of Congress. At that time there had not been any considerable investigation of the effect on the lake levels.

In 1907, however, when the subject of a further diversion by opening a new outlet through the Calumet came up, the subject of the effect on lake levels had been elaborately investigated by the United States Lake Survey and the Secretary of War and the Chief of Engineers had before them its reports and also the conclusions of the International Waterways Commission in its report of January 4, 1907. The Chief of Engineers reached the conclusion that the proposed further abstraction would—

> undoubtedly lower the levels of all the waters of the Great Lakes, except those of Lake Superior, and thus diminish the navigable capacity and depth of the various channels and harbors which have been deepened and improved under authority of Congress—

and came to the conclusion that the War Department should deny the application, it being a matter for the sanction of Congress. (Rec. Vol. VII, pp. 23–25.) The Secretary of War followed the recommendation of the Chief of Engineers, as the statute required him to, and denied the application. Both the Wilmette Permit of September 11, 1907, and the Calumet Permit of June 30, 1910, were expressly conditioned on a limitation of the total withdrawal to 4167 c. s. f.

On February 5, 1912, appellant applied for permission to divert 10,000 c. s. f. There was an ex-

tended hearing. The report of Lt. Col. Zinn, Engineer in charge at Chicago (Rec. Vol. VI, pp. 3732–3737), shows the reasons for the recommendation of the Chief of Engineers against allowing the application; the reasons were substantially the same as those expressed by the Secretary of War. In his decision on January 8, 1913, denying the application, the Secretary of War came to the following conclusions (among others):

> First. That the diversion of 10,000 cubic feet per second from Lake Michigan, as applied for in this petition, would substantially interfere with the navigable capacity of the navigable waters in the Great Lakes and their connecting rivers.
>
> Second. That that being so, it would not be appropriate for me, without express congressional sanction, to permit such a diversion, however clearly demanded by the local interests of the sanitation of Chicago.

With regard to the prior permits, he said:

> The propriety of obtaining congressional sanction for the project has been pointed out from the beginning; and the form in which the permit has been granted, even for the moderate amount of diversion permitted, has been so phrased as to indicate that the permission was predicated upon the absence of any substantial injury to commerce. (Rec. Vol. VII, pp. 7–17.)

The Chief of Engineers and the Secretary of War have, therefore, made a decision, after a hearing in

which there has never been a suggestion of unfairness or fraud or arbitrary action, that a diversion of more than 4,167 c. s. f. would be an obstruction to the navigable capacity of navigable waters of the United States and that, therefore, the increased diversion was one which only Congress could authorize. Certain it is that the Chief of Engineers and the Secretary of War refused to authorize it. The appellant, however, proceeded in defiance of the decision to divert an increased amount of water until it now exceeds 10,000 c. s. f.

We submit that the necessary effect of Section 10 of the Act of Congress of March 3, 1899, is to make the decision of the Chief of Engineers and the Secretary of War final. The decision of such a question by Congress is, as we have already pointed out in the preceding subheading, final as a determination of a legislative question. By Section 10 it has necessarily committed the determination of certain facts to these officers of the United States. They can recommend and authorize a modification of the condition of navigable waters if and when, after investigation by the Chief of Engineers, they find that the modification will not amount to an *obstruction*. If they find that it *will* amount to an obstruction, then the modification must await the action of Congress. Furthermore, even if there were no showing that the modification would actually amount to an obstruction, there is no duty on the part of the Chief of Engineers to recommend, or the Secretary of War to authorize, it. They may and should

be guided by what seems to be for the best interest of the United States in the preservation of the navigability of its waters.

The appellant is now asking this Court to disregard, as appellant has done, what is in effect the decision of Congress on a legislative matter. While the decision comes from the Chief of Engineers and the Secretary of War, it must be regarded as having the same force and effect as that of Congress which might unquestionably have determined the matter itself. The decisions of this Court do not, we believe, leave the matter open to doubt. In *Southern Pacific Co. et al.* v. *Olympian Dredging Co.*, 260 U. S. 205, this Court said (pp. 208–210):

> That the Secretary of War was authorized to impose the condition heretofore quoted does not admit of doubt. The power to approve implies the power to disapprove, and the power to disapprove necessarily includes the lesser power to condition an approval. In the light of this general assumption by Congress of control over the subject and of the large powers delegated to the Secretary, the condition imposed by that officer can not be considered otherwise than as an authoritative determination of what was reasonably necessary to be done to insure free and safe navigation so far as the obstruction in question was concerned.
>
> * * * * * *
>
> It was not for the petitioners, however, to question either his reasons or his conclusions. They were justified in proceeding upon the assumption that what the Secretary, in the

exercise of his lawful powers, declared to be no obstruction to navigation, was in fact no obstruction. The language which this court employed in *Monongahela Bridge Co.* v. *United States*, 216 U. S. 177, 195, is pertinent. "* * * Congress intended by its legislation to give the same force and effect to the decision of the Secretary of War that would have been accorded to direct action by it on the subject. It is for Congress, under the Constitution, to regulate the right of navigation by all appropriate means, to declare what is necessary to be done in order to free navigation from obstruction, and to prescribe the way in which the question of obstruction shall be determined. Its action in the premises can not be revised or ignored by the courts or by juries, except that when it provides for an investigation of the facts, upon notice and after hearing, before final action is taken, the courts can see to it that executive officers conform their action to the mode prescribed by Congress."

See also the cases cited under the preceding subheading. These cases meet every contention made by appellant both in its Point VIII and its Point III (c).

IV

Appellant has created and is maintaining an obstruction to the navigable capacity of navigable waters of the United States in violation of section 10 of the act of Congress of March 3, 1899

That appellant has violated and is continuing to violate the last clause of Section 10 of the Act of

1899, forbidding modification of the condition, etc. of navigable waters, hardly seems open to question. The creation of a large navigable river flowing away from Lake Michigan into the Mississippi River Basin, equal in volume to the combined flow of the Grand, Fox, and St. Joseph Rivers and substantially five per cent of the flow over Niagara Falls; the lowering of the lake levels; the increased current in the Chicago River, and other incidents—show such a violation conclusively. We shall, therefore, take no time to demonstrate what is self-evident, by discussion of the evidence in this connection.

That appellant is likewise violating the first clause of Section 10 forbidding the creation of obstructions to navigable capacity can hardly be doubted, under the evidence in this case and the decisions of this Court. In our Statement of the Case (pp. 74 to 78) we have pointed out the conclusions reached, after careful investigation and painstaking observations over a period of years, by the Chief of Engineers, the United States Lake Survey, and the International Waterways Commission as to the amount of the lowering of levels. The question was raised in the Calumet River Suit instituted in 1908 and the appellant made no effort to rebut the testimony of appellee's witnesses on this subject, all men of experience and standing. In the hearing before the Secretary of War on appellant's application for an increased diversion, which led to the Secretary's decision of January 8, 1913, and his findings as to the

effect of the diversion, the Chief Engineer for appellant said he did not wish "to question the accuracy of the figures or the fairness of the calculations." It was only after the application had been refused and the Main Channel Suit was instituted that appellant sought to discredit the figures and calculations. It sought to do so largely through the testimony of one man who was employed by appellant in connection with the litigation and therefore was not a disinterested witness, a man whose expert qualifications will not bear close scrutiny. On the basis of the data furnished by *appellee's* witnesses, this individual assumed to criticize the methods, observations, and deductions of the United States Lake Survey, the International Waterways Commission, and the testimony of a host of competent expert engineers. The superficiality of his criticisms is amply demonstrated by the evidence, and we do not feel called upon to enter upon a detailed discussion of its technical features. Even this witness, however, conceded a lowering in the lake levels of approximately two inches less than those of the appellee's most trustworthy witnesses. In the case of Lake Michigan appellant's witness conceded a lowering of 4.1 inches for a diversion of 10,000 c. s. f. (See Statement of the Case, p. 79.)

The material and substantial injury to navigation caused by each inch of lowering is, we believe, incontrovertibly established by the evidence. (See Statement of the Case, p. 94.) That we are dealing,

not with a fanciful or theoretical effect, but a concrete obstruction is perfectly apparent from the narrow margin which the larger boats have even now over critical points in the Great Lakes. It will not do to say that there should be a clearance of two feet anyway as a margin of safety. The same result follows: the draught of the boat must still be so many inches less. The same applies to the oscillations due to barometric conditions, etc.

Finally, the injury to navigation by the increased and dangerous current in the Chicago River must be considered; the Secretary of War has repeatedly indicated his view that a current of a mile and a quarter an hour is all that is consistent with safe navigation of the river. We do not believe that appellant will gainsay that it has created and is maintaining a current of a greater rapidity.

That the unauthorized acts of appellant have created an obstruction in violation of the prohibition of Section 10 of the Act of 1899 is clear from a consideration of the cases interpreting the meaning and scope of the clause in question.

A

"Anything wherever done or however done, within the limits of the jurisdiction of the United States, which tends to destroy the navigable capacity of one of the navigable waters of the United States, is within the terms of the prohibition"

The language quoted in this subheading is from the opinion of this Court in *United States* v. *Rio Grande Dam & Irrigation Company*, 174 U. S. 690. In that case the Irrigation Company was proceeding to construct a dam across the Rio Grande River in the

territory of New Mexico and to appropriate the waters of that stream for the purposes of irrigation. The Rio Grande River was not navigable within the limits of New Mexico, but became a navigable river at a point considerably lower down in its course. Under the issues raised by the pleadings, the facts were assumed to be that most of the flow of the river had already been appropriated by other parties and the defendant proposed to take the balance. This, according to the averment of the defendant, "would be very largely only so acquired from the excess storm and flood waters now unappropriated, useless, and going to waste." This Court said (p. 708):

> It is urged that the true construction of this act limits its applicability to obstructions in the navigable portion of a navigable stream, and that as it appears that although the Rio Grande may be navigable for a certain distance above its mouth, it is not navigable in the territory of New Mexico, this statute has no applicability. The language is general, and must be given full scope. It is not a prohibition of any obstruction to the navigation, but any obstruction to the navigable capacity, and anything, wherever done or however done, within the limits of the jurisdiction of the United States which tends to destroy the navigable capacity of one of the navigable waters of the United States, is within the terms of the prohibition. Evidently Congress, perceiving that the time had come when the growing interests of commerce required that the navigable waters of the United States

> should be subjected to the direct control of the national government, and that nothing should be done by any state tending to destroy that navigability without the explicit assent of the national government, enacted the statute in question. And it would be to improperly ignore the scope of this language to limit it to the acts done within the very limits of navigation of a navigable stream.

This language is, in itself, sufficient answer to the untenable position taken by appellant throughout its brief that, having widened and improved the channel of the Chicago River under its permits of July 11, 1900, so as to accommodate an increased flow, appellant was thereafter helpless to control the amount of water flowing into its canal, and was not responsible if 10,000 c. s. f. happened to go through its gates at Lockport. The words "anything wherever done or however done" seem broad enough to cover the failure and refusal of appellant to close its gates far enough to limit the flow to 4,167 c. s. f., especially in view of its acceptance of the various permits up to and including the Wilmette Permit of September 11, 1907 and the Calumet Permit of June 30, 1910, in both of which appeared the express condition that the total diversion of water from Lake Michigan should not exceed the 4,167 c. s. f. already authorized. Appellant received privileges in these permits on what must be construed to be an additional agreement on its part to observe the limitation on the diversion.

B

To constitute an obstruction neither material injury and damage to commerce nor unreasonable obstruction to navigation are necessary

Under its Point VI (b), appellant contends that the injury and damage to commerce must be *material* and the obstruction to navigation must be *unreasonable*. Both requirements are, as a matter of fact, met in the instant case. (See Statement of the Case, *supra*, pp. 70 to 106.) That appellant's contention is not the law, however, is clear from consideration of this Court's decisions in *United States* v. *Rio Grande Dam & Irrigation Company*, 174 U. S. 690, and *Economy Light & Power Co.* v. *United States*, 256 U. S. 113.

In the Rio Grande case this Court passed adversely on such a contention in saying of the language in Section 10 (p. 708):

> It is not a prohibition of any obstruction to the *navigation*, but any obstruction to the navigable *capacity*.

The case was remanded, directing—

> an inquiry into the question whether the intended acts of the defendants * * * will substantially diminish the *navigability* of that stream within the limits of present navigability, and if so, to enter a decree restraining those acts to the extent that they will so diminish. (p. 710.)

That the evidence in the instant case meets this requirement is shown in our Statement of the Case. We do not belive that the word "substantially" as

used by this Court in the excerpt just quoted was intended to mean more than *appreciably*, that is, in a manner in which it would have to be taken account of in estimating the navigable capacity of a water. If it be true, as appellant asserts, that harbors and other improvements built in the Great Lakes since the diversion have been calculated so as to allow for the several inches loss in level, further proof would be unnecessary. The importance of every inch in critical points in these waters is, however, proved by the practice of navigators in taking careful note of the levels in connection with loading their vessels; every loss of an inch means a loss in tonnage of some eighty tons. A matter of five or six inches is very substantial in places where, like the Poe Lock, there is a depth of only 18 to 20 feet. (Rec. Vol. VI, p. 3643.)

Appellee was under no obligation to prove material injury and damage to commerce, but, nevertheless, did so. (Statement of the Case, *supra*, pp. 94 to 106.) That this was not a necessary element in its case is clear, not only from the Rio Grande case, but also *Economy Light & Power Co.* v. *United States*, 256 U. S. 113. In that case the United States sought by injunction to restrain the Power Company from constructing a dam in the Desplaines River in Illinois.

> The district court found that there was no evidence of actual navigation within the memory of living men, and that there would be no present interference with navigation by the building of the proposed dam. The

> circuit court of appeals did not disturb this finding [168 C. C. A. 138, 256 Fed. 792, 798]. But both courts found that in its natural state the river was navigable in fact (p. 117).
>
> * * * * *
>
> We concur in the opinion of the circuit court of appeals that a river having actual navigable capacity in its natural state, and capable of carrying commerce among the states, is within the power of Congress to preserve for purposes of future transportation, even though it be not at present used for such commerce, and be incapable of such use according to present methods, either by reason of changed conditions or because of artificial obstructions (p. 123).

That a small variation of lake levels is *substantial* and may constitute an obstruction is confirmed by the language we have elsewhere quoted from *United States* v. *Chandler-Dunbar Water Power Co.*, 229 U. S. 53, (*supra*, p. 131).

Another case which may be considered in this connection is the first *Wheeling Bridge case*, 13 How. 553. As has already been pointed out, practically all the contentions here made by appellant were urged and overruled (*supra*, p. 139). See, too, the excerpt elsewhere quoted from *Hubbard* v. *Fort*, 188 Fed. 992 (*supra*, p. 178).

Appellant cites *Union Bridge Co.* v. *United States*, 204 U. S. 364. That case, however, involved a proceeding in the nature of a criminal information under Section 18 of the Act of 1899 making it the duty of the

Secretary of War to institute certain proceedings whenever he—

> shall have good reason to believe that any railroad or other bridge now constructed, or which may hereafter be constructed, over any of the navigable waterways of the United States, is an *unreasonable* obstruction to the free navigation of such waters.

The insertion of the word "unreasonable" was naturally due to the conflicting interests of commerce over the bridge and under the bridge. The fact that the word was specifically employed in the case of bridges confirms our contention that it is not to be read into Section 10.

We do not comprehend in what respect the other cases cited by appellant on this subject can possibly be deemed in point.

Appellant's Point VI, (c), is substantially a paraphrasing of the point just discussed, with the additional claim that the obstruction must "*clearly exist.*" The cases chiefly relied on, *New York* v. *New Jersey & Passaic Valley Sewage Commissioners*, 256 U. S. 296, and *Kansas* v. *Colorado*, 206 U. S. 46, are readily distinguished from the instant case. The principle governing controversies between states, as expressed by this Court in the former case, as is follows (p. 309):

> Before this court can be moved to exercise its extraordinary power under the Constitution to control the conduct of one state at the suit of another, the threatened invasion of rights must be of serious magnitude, and it must be

established by clear and convincing evidence. *Missouri* v. *Illinois*, 200 U. S. 496.

The reasons for this principle are clearly set forth in *Kansas* v. *Colorado* (pp. 97–98).

> As Congress can not make compacts between the states, as it can not, in respect to certain matters, by legislation compel their separate action, disputes between them must be settled either by force or else by appeal to tribunals empowered to determine the right and wrong thereof. Force, under our system of government, is eliminated. The clear language of the Constitution vests in this court the power to settle those disputes. We have exercised that power in a variety of instances, determining in the several instances the justice of the dispute. Nor is our jurisdiction ousted, even if, because Kansas and Colorado are states sovereign and independent in local matters, the relations between them depend in any respect upon principles of international law. International law is no alien in this tribunal.
>
> * * * * * *
>
> One cardinal rule, underlying all the relations of the states to each other, is that of equality of right. Each state stands on the same level with all the rest. It can impose its own legislation on no one of the others, and is bound to yield its own views to none. Yet, whenever, as in the case of *Missouri* v. *Illinois*, 180 U. S. 208, the action of one state reaches through the agency of natural laws, into the territory of another state, the question of the extent

> and the limitations of the rights of the two states becomes a matter of justiciable dispute between them, and this court is called upon to settle that dispute in such a way as will recognize the equal rights of both and at the same time establish justice between them. In other words, through these successive disputes and decisions this court is practically building up what may not improperly be called interstate common law.

This principle of equality has no application to a case which presents a conflict between a paramount sovereign power of Congress and an assertion of power by a state.

> There is no room in our scheme of government for the assertion of state power in hostility to the authorized exercise of Federal power. (*Minnesota Rate Cases*, 230 U. S. 352, 399)

The case of *Mississippi R. R. Co.* v. *Ward*, 2 Black 485 (cited and quoted in Appellant's Brief, p. 199) was simply a suit between private individuals.

In the instant case, however, the obstruction was *clearly* proved unless the conjectures and superficial criticisms of one person, whose interest and qualifications are open to question, can be deemed to cast any serious doubt on the conclusions of the United States Lake Survey, the International Waterways Commission, the Chief of Engineers of the United States, the Secretary of War, and a host of expert engineers of high standing.

C

Appellant's criticism of appellee's use of expert evidence in this case is unfounded

In its Point VI (a) appellant takes occasion to criticize appellee's use of expert testimony to prove the lowering of the levels of the Great Lakes and the injury to navigation and commerce, and complains that "no one testified to observing any lowering effect" or "to observing a loss in the amount the boats actually carried." (Appellant's Brief, p. 194). Does one need to see very much more than the physical phenomenon of a large navigable river carrying 10,000 c. s. f. into the Mississippi Valley? Appellant will not assert that the evidence of the total discharge of the Niagara River was a mere matter of expert testimony, and that it is taking practically five per cent of that discharge. It will not deny that it is abstracting from Lake Michigan substantially as much as is contributed by the combined flow of the Grand, St. Joseph, and Fox Rivers.

Such a contention was made and answered in the first *Wheeling Bridge Case*, 13 How. 518, 568:

> The fact that the bridge constitutes a nuisance is ascertained by measurement. The height of the bridge, of the water, and of the chimneys of steamboats are the principal facts to be ascertained. If the obstruction exists, it is a nuisance. To ascertain this a jury is not necessary. It is shown in the report, by a mathematical demonstration. And the other matters connected with the case as to the benefit of high chimneys, lowering of them in pass-

> ing under the bridge, and shortening chimneys, are matters of science and experience, better ascertained by a report than by a verdict. And the same may be said of the statistics which are in the case.

Appellant cites *Missouri* v. *Illinois*, 200 U. S. 496, and *North Dakota* v. *Minnesota* 263 U. S. 365. We have already pointed out the distinction between controversies among states, which come into this Court on a basis of equality, and the present controversy, in which the Federal Government is asserting its paramount right. *Salvin* v. *North Brancepeth Coal Co.*, L. R. 9 Ch. App. 705, also cited by appellant, was a controversy between private parties, and can be of no assistance in a case of this kind.

V

The obstructions created by appellant have never been affirmatively authorized by Congress as required by section 10 of the act of March 3, 1899

Under its Point I appellant claims to find Congressional authority for an apparently unlimited diversion of water in the Act of Congress of March 2, 1827, relating to the Illinois and Michigan Canal, and even goes so far as to assert that—

> The Secretary of War construed the Congressional Act of March 2, 1827, and the laws of Illinois, as affirmatively authorizing the diversion. (Appellant's Brief, p. 90.)

This is the only express claim of appellant to Congressional authority but elsewhere in its brief we find substantially the same contention made with

regard to the Niagara Falls Act of 1906 and the Canadian Boundary Waters Treaty of January 11, 1910 (Appellant's Brief, pp. 188–192). We shall treat of all three claims of authority under the same heading.

We discuss them only under protest. Section 10 of the Act of Congress of March 3, 1899, demands that the particular obstruction be "*affirmatively* authorized," and the word "affirmatively" forbids any *implication* of authority. The statutory requirement can not be met by anything short of *express* authority.

A

The Act of Congress of March 2, 1827, relating to the Illinois and Michigan Canal did not constitute such authorization.

Fully to appreciate appellant's ingenuity in resurrecting this ancient Act of 1827 (4 St. at L. 234) it is necessary only to read its provisions and to know how much, or how little, was done under the authority of that statute. We need not pause to discuss the prior Act of March 30, 1822 (3 St. at L. 659) as, by its terms, it was abandoned by failure of Illinois to comply with its conditions. The pertinent portions of the Act of 1827 are as follows:

> An act to grant a quantity of land to the State of Illinois for the purpose of aiding in opening a canal to connect the waters of the Illinois River with those of Lake Michigan. [Approved and in force March 2, 1827.]
>
> SECTION 1. *Be it enacted by the Senate and House of Representatives of the United States of America in Congress Assembled*, That there be

and hereby is granted to the State of Illinois, for the purpose of aiding the said State in opening a canal to unite the waters of the Illinois River with those of Lake Michigan, a quantity of land equal to one-half of five sections in width, on each side of said canal, and reserving each alternate section to the United States, to be selected by the Commissioner of the Land Office, under the direction of the President of the United States, from one end of the said canal to the other; and the said land shall be subject to the disposal of the Legislature of the said State, for the purpose aforesaid, and no other: *Provided*, That the said canal when completed, shall be and forever remain a public highway for the use of the Government of the United States, free from any toll, or other charge, whatever, for any property of the United States, or persons in their service passing through the same: *Provided*, That said canal shall be commenced within five years and completed in twenty years, or the State shall be bound to pay to the United States the amount of any lands previously sold, and that the title to purchasers under the State shall be valid.

SEC. 2. And be it further enacted, That so soon as the route of the said canal shall be located and agreed on by the said State, it shall be the duty of the Governor thereof, or such other person or persons as may have been, or shall hereafter be, authorized to superintend the construction of said canal, to examine and ascertain the particular sections to which said State will be entitled, under the provisions of

this act, and report the same to the Secretary of the Treasury of the United States.

SEC. 3. And be it further enacted, That the said State under the authority of the Legislature thereof, after the selection shall have been so made, shall have power to sell and convey the whole or any part of the said land, and to give a title in fee simple therefor, to whomsoever shall purchase the whole or any part thereof. (Rec. Vol. VIII, Rec. 68–69.)

This land grant amounted to 200,000 acres. (Rec. Vol. IV, p. 2228.)

By an act passed January 9, 1836, the State Legislature of Illinois provided for the construction of the Illinois and Michigan Canal (Rec. Vol. IV, pp. 2295–2304):

SEC. 16. (Description—Proviso). The said canal shall not be less than forty-five feet wide at the surface, thirty feet at the base, and of sufficient depth to insure a navigation of at least four feet, to be suitable for ordinary canal-boat navigation, to be supplied with water from Lake Michigan and such other sources as the canal commissioners may think proper, and to be constructed in the manner best calculated to promote the permanent interest of the country; reserving ninety feet on each side of said canal to enlarge its capacity, whenever in the opinion of the board of canal commissioners the public good shall require it.

The canal as originally projected and worked on from 1836 to 1841 had a declivity of an inch per mile, or 2.9 feet between Bridgeport (on the fork of the

south branch of the Chicago River) and Lockport. Lack of funds prevented its completion on this plan. When work was resumed in 1843 a temporary expedient was adopted, of a temporary level eight feet above the Chicago datum. (Rec. Vol. III, 1718.) The canal was opened in 1848. It was fed in ordinary seasons from the Desplaines River and by a feeder through the Sag Valley and the Calumet River at Blue Island. A dam was built across the Calumet River at an elevation eleven feet above the Chicago datum. This was not sufficient in the dry seasons, and a Dutch Wheel or Lift Wheel was erected at Bridgeport for the purpose of supplementing the feed water of the canal. (Rec. Vol. III, p. 1716.) In time of drought—about 45 days in the year—the canal received water by pumping from the Chicago River. (Rec. Vol. VI, p. 3723.)

In 1865, an enabling act was procured from the Illinois Legislature which authorized the City of Chicago, by arrangement with the Canal Trustees, to deepen this canal on the original plan for sanitary purposes. (Rec. Vol. VIII, pp. 70–71.) This plan was completed in 1871. When opened to gravity the canal is estimated by appellant's witness Cooley to have carried out 40,000 cubic feet per minute. The lake was then high and in later years, when it fell, the capacity shrunk to 15 to 20,000 cubic feet per minute, which was scarcely more than the dry weather flow. In 1881 the Illinois Legislature by resolution authorized Chicago to install pumps at the north terminus of the canal (i. e., Bridgeport) whereby at least

60,000 cubic feet per minute should be pumped from the Chicago River into the canal. These pumps were installed in 1883, but were not taken over by the city until 1886. (Rec. Vol. III, 1718–1719.)

According to appellant's own witness, Cooley, after 1883 the Illinois and Michigan Canal was operated—

> up to a limit of 60,000 feet of water per minute or a thousand feet per second, which was little in excess of the ordinary flow of the sewers coming from the water supply and the ground waters. (Rec. Vol. III, p. 1736.)

In testimony given several years later, after the hearing before the Secretary of War, appellant's Chief Engineer Wisner, stated that the capacity of the canal after 1871 was 24,000 cubic feet per minute, and that after the installation of the pumping works at Bridgeport, a total of 50,000 to 60,000 cubic feet per minute was caused to flow into the canal from the Chicago River. The witness then made what was on its face a *guess*, unsupported by observation, measurements, or facts, that the diversion of this amount—

> had the practical effect of reversing the Chicago River * * * when there was a dry weather flow (i. e., a minimum run-off). (Rec. Vol. VI, p. 8433.)

If the dry-weather flow of the Chicago River is as little as 60,000 cubic feet per minute, it is hard to understand why appellant's witnesses elsewhere were so bold as to state its maximum run-off as 10,000

c. s. f. If any water was ever diverted from *Lake Michigan* before the opening of the appellant's canal in 1900, it was an insignificant amount in a limited portion of the year, and that there ever was a reversal of current prior to 1900 may well be doubted.

Now, having briefly reviewed the history of this canal, we may appropriately repeat the comment made by representatives of the Canadian Government in a brief filed with the Secretary of War in reply to appellant's contention:

> To argue that the operation of a small pumping plant for 45 days in the year raising an insignificant amount of water for navigation purposes for locks 110 feet long, 18 feet wide and 6 feet deep, justifies the diversion of 10,000 cubic feet of water per second, is a somewhat unusual expansion of terminology. (Rec. Vol. VI, p. 3724.)

The decision of the Secretary of War on January 8, 1913, contained the following:

> In the argument before me it was urged that the present canal represented the growth and development of a national policy expressed in two acts of Congress, 1822 and 1827, which authorized the construction of a canal "to connect the Illinois River with Lake Michigan," thus connecting the two watersheds. (Acts of March 30, 1822, and March 2, 1827.) But these statutes authorized a canal for the purpose of navigation and not sanitation. (*Missouri* v. *Illinois*, 200 U. S. 526.) The Illinois and Michigan Canal, actually con-

> structed under their authority, derived its water for navigation purposes from the Calumet, Des Plaines, and Chicago Rivers, and not from the Lakes. And although in the latter part of its existence it was used to a very slight extent to help purify the waters of the Chicago River and thus sanitate the City of Chicago, such a purpose could not have been dreamed of at the time its construction was authorized by Congress, 90 years ago. I can not see that its authorization and construction offer the slightest congressional sanction for the great canal now under discussion, which was not even contemplated until much more than half a century later. (Appellant's Narrative, pp. 29–30.)

The reasoning of the Secretary of War would seem unanswerable. Since counsel, however, press the point so urgently, we shall pursue it further.

1. *The authority in both the act of March 30, 1822, and the act of March 2, 1827, was for the construction of a particular canal, the location of which was to be determined by law.*

The act of the Illinois Legislature of January 9, 1836, reserved ninety feet on each side of the proposed canal "to enlarge its capacity" and the canal was constructed under the authority of that act. It is not claimed that the appellant's canal is within this ninety foot zone; it could not be, for the new canal is 160 to 200 feet wide. The land granted to Illinois by the Federal government was sold to individuals.

The Act of Congress authorizes *a* canal, not two canals or a dozen. Would appellant claim that Congressional authority to build one bridge over the Ohio River includes authority to build another a mile away?

The Illinois and Michigan Canal exists to-day. In fact, it was the subject of legislation by the General Assembly of Illinois as late as July 1, 1919, Section 3 of which is exceedingly interesting in view of appellant's assertion that its canal *replaces* the old one:

> SEC. 3. The Department of Public Works and Buildings is authorized and directed to protect against and prevent encroachments upon said Illinois and Michigan Canal *throughout its entire course as originally constructed, and to preserve its navigable condition throughout said entire course*, and it may, when the permission of the Federal government is obtained, change and improve said canal to provide terminal and harbor facilities for interchange of freight or for any other use in connection with transportation which said department may deem advantageous to the State. No permission heretofore or hereafter granted, which results in obstruction to the navigable condition or capacity of any portion of said canal or interferes with its use for any of the purposes herein named shall operate in any way whatever to deprive the State of any of its rights in said canal or canal lands, and all obstructions or structures heretofore or hereafter erected or placed in said canal shall be subject

> to removal upon the order of said Department of Public Works and Buildings: *Provided, however*, The use of the Sag Channel of the Sanitary District of Chicago shall not be prevented nor shall it be considered an obstruction within the meaning of this section, but the State may require, in the development of its waterways and the use of said Illinois & Michigan canal such changes in the crossing of the Illinois and Michigan canal by said Sag channel as may be necessary for the use of said Illinois and Michigan canal by the State.

Note, too, that the Illinois Legislature does not regard itself as immune from Federal control with respect to the old canal. It regards it as necessary to obtain the permission of the Federal government to change or improve the canal. And yet appellant is in substance saying that the Illinois Legislature bestowed upon appellant in 1889 all its rights in connection with the old canal and that these rights included authority to build a new one many times its size. When counsel state (Appellant's Brief, p. 123) that—

> Illinois fixed the amount of the diversion by appellant's organic act, which action was also pursuant to the Act of Congress of March 2, 1827;

they are ascribing an intention to the Illinois Legislature which it did not have and which was specifically negatived no longer ago than 1919. *Appellant has nothing whatsoever to do with the canal constructed under the Act of Congress of 1827*, and has no rights

with respect to it further than permission to cross it with the Sag channel. Even this permission is subject to such modification "as may be necessary for the use of said Illinois and Michigan Canal by the State."

2. *The authority in the act of March 2, 1827, was for a canal for the purpose of navigation and not sanitation*

Neither Congress nor the State of Illinois contemplated the use of the proposed canal for any purpose but navigation. It is extremely doubtful whether Congress has any power to authorize a diversion of navigable waters for the mere purpose of sanitation; at any rate, it did not intend to do so. From 1871 to 1900 it was as a matter of fact used by the city of Chicago to some extent for sewage disposal. The authority of Congress to do this was not asked nor given. The amount of water taken was insignificant and it is doubtful whether at its maximum Chicago withdrew a perceptible quantity from Lake Michigan. In *Missouri* v. *Illinois*, 200 U. S. 496, this Court, referring to the early Acts of Congress, said (p. 526):

> Of course these acts do not grant the right to discharge sewage.

There is evidence in this case that 1,000 c. s. f. is sufficient for navigation purposes. (Rec. Vol. VI, pp. 3633–4.) The fact that a canal is big enough to accommodate 10,000 or 14,000 c. s. f. does not mean that appellant *has* to take that much. In fact a slower current would be better for purposes of navi-

gation. The fact that the maximum run-off of the Chicago River is 10,000 c. s. f. is immaterial. So far as navigation is concerned, it makes little difference whether the current flows one direction or the other. Furthermore, the maximum run-off of the Calumet River is over 15,000 c. s. f. Does that mean that eventually appellant will be forced to take over 25,000 c. s. f. under the Act of 1827?

When counsel for appellant state (Appellant's Brief, p. 122) that—

> To provide a "never-failing supply of water for navigation of the Illinois River at all times," it was likewise necessary to have a volume of water from Lake Michigan for navigation purposes of that amount (e. g. 10,000 c. s. f.)—

they are making a statement without foundation in the record or in fact.

In this connection the following may be quoted from *Ex parte Boyer*, 109 U. S. 629, 631:

> The Illinois and Michigan Canal is an artificial navigable waterway, connecting Lake Michigan and the Chicago river with the Illinois river and the Mississippi river. By the Act of Congress of March 30th, 1822 (ch. 14, 3 Stat. at L. 659), the use of certain public lands of the United States was vested in the State of Illinois forever, for a canal to connect the Illinois river with the southern bend of Lake Michigan. The Act declared "That the said canal, when completed, shall be and forever remain a public highway, for the use of the Government of the United States, free from any toll or other charge whatever, for

> any property of the United States, or persons in their service, passing through the same." This declaration was repeated in the Act of March 2, 1827 (ch. 51, 4 Stat. at L. p. 234), granting more land to the State of Illinois to aid it in opening the canal. We take judicial notice of the historical fact that the canal, 96 miles long, was completed in 1848, and is 60 feet wide and 6 feet deep, and is capable of being navigated by vessels which a canal of such size will accommodate and which can thus pass from the Mississippi river to Lake Michigan and carry on interstate commerce, although the canal is wholly within the territorial bounds of the State of Illinois. By the Act of 1822, if the land granted thereby shall cease to be used for a canal suitable for navigation, the grant is to be void.

If, as this case seems to imply, the Illinois and Michigan Canal became a navigable water of the United States, then there could have been no modification of its course, condition, *location*, or capacity after September 19, 1890, without the approval of the Secretary of War. Nor could it have been excavated or filled in without such approval. The Act of Congress of that date, in Section 7, forbade it. A declaration of its navigability was made by the Illinois Legislature.

Appellant's assertion that in constructing the new canal it was merely *replacing* the original canal becomes merely the admission that it was from the outset engaged in an unlawful act.

3. *Sections 7 and 10 of the Act of Congress of September 19, 1890, and section 10 of its Act of March 3, 1899, made unlawful any greater diversion than was already being effected in 1890*

The largest amount of water ever forced into the Illinois and Michigan Canal at the Bridgeport Pumping Station was 60,000 cubic feet per minute, and even that amount was not maintained at all times. Let us assume, however, that that much was being withdrawn when the Act of 1890 became effective. Thenceforth any increase in the diversion was *at least* a modification of the condition, etc., of a navigable water of the United States, namely, the Chicago River, and, if on occasions of dry weather flow the current was reversed from Lake Michigan, there was not only a modification of the *course* of the Chicago River but also a modification of the condition of Lake Michigan. If the diversion became great enough appreciably to affect the level of Lake Michigan or to cause a dangerous current in the Chicago River, then there was an *obstruction*. By its legislation Congress said in effect, that the navigable waters of the United States should be left in *statu quo*.

Whatever authority the State may have had under the Act of 1827, the Act of 1890 put an end to any *further* or *increased* exercise of it.

Somewhat the same contention was made in *United States* v. *Rio Grande Dam & Irrigation Co.*, 174 U. S. 690. The Irrigation Company sought

to justify its obstruction of the Rio Grande River by certain acts of Congress (14 St. at L. 253, Chap. 262 and 26 St. at L. 1101), of which this Court said (p. 706):

> Obviously by these acts, so far as they extended, Congress recognized and assented, to the appropriation of water in contravention of the common-law rule as to continuous flow. To infer therefrom that Congress intended to release its control over the navigable streams of the country and to grant in aid of mining industries and the reclamation of arid lands the right to appropriate the waters on the sources of navigable streams to such an extent as to destroy their navigability, is to carry those statutes beyond what their fair import permits.
>
> * * * * *
>
> To hold that Congress, by these acts, meant to confer upon any state the right to appropriate all the waters of the tributary streams which unite into a navigable watercourse, and so destroy the navigability of that watercourse in derogation of the interests of all the people of the United States, is a construction which can not be tolerated. It ignores the spirit of the legislation and carries the statute to the verge of the letter and far beyond what under the circumstances of the case must be held to have been the intent of Congress.

Similarly in the instant case, however, appellant may attempt to disguise its claim, it is really claiming the "right to appropriate all the waters of the tributary streams which unite into a navigable watercourse and so destroy the navigability of that

watercourse." If the Act of Congress of 1827 is still in force and authorizes a diversion of 10,000 c. s. f. in defiance of the Secretary of War, then there is no limit to the diversion appellant may lawfully make. That, in fact, this has in the past been appellant's position is indicated by the report in 1911 of appellant's president in which he says:

> I am of the opinion that the presumption that our water supply is to be limited to 10,000 cubic feet per second, or 600,000 cubic feet per minute, is gratuitous and mischievous and should not be voiced by the officials of this district. I believe that we should have the volume requisite to our needs as they appear and are justified. (Appellant's Narrative, p. 34.)

Grants by Congress of authority to create obstructions to navigable waters must be strictly construed. *Newport and Cincinnati Bridge Co.* v. *United States*, 105 U. S. 470.

4. *The diversion through the Illinois and Michigan Canal affected only an intrastate water, i. e., the Chicago River; it did not affect interstate waters, such as the Great Lakes.*

Except for the guess of appellant's witness Wisner, its Chief Engineer, there is no evidence that even the maximum amount of water diverted through the Illinois and Michigan Canal effected a reversal of current in the Chicago River and caused water to flow in from Lake Michigan. Even the reversal testified to by Wisner took place only in the dry-weather

flow. At no time was an *appreciable* amount of water abstracted from the lake, and at that it had to be pumped out—gravity was not sufficient.

The only navigable water affected was therefore the Chicago River, and that, being an intrastate water, was subject to the State's authority prior to September 19, 1890. The limited diversion of 1,000 c. s. f. might therefore be deemed to have been "affirmatively authorized by law" within the requirement of Section 10 of the Act of that date. This could furnish no justification for interference with an *interstate* navigable water such as Lake Michigan by diverting an amount sufficient appreciably to affect it.

Other considerations may suggest themselves further in answer to appellant's claim that its acts are authorized by the Act of Congress of 1827. We believe that the foregoing sufficiently dispose of appellant's strange claim; and that it is unnecessary to point out the constantly reiterated inaccuracies contained in its brief as to the intentions and purposes of the Secretary of War, the State and the appellant. None of them dreamed of invoking the authority of the Act of 1827 until the exigencies of this litigation made it necessary for appellant to hunt desperately for authority.

We recur, however, to a rather pertinent inquiry: by what right, title or interest is *appellant* asserting any authority under the Act of 1827? None has been delegated to it by the Illinois Legislature, and the State of Illinois is not a party to this litigation.

B

The Niagara Falls Act of 1906 did not constitute such authorization; if anything, it forbade the unauthorized diversion

We are not certain as to whether or not appellant means to place any reliance on this statute. (See Appellant's Brief, pp. 51–54, pp. 179–180.) We submit, however, that not only do its provisions not support appellant's interpretation of it but they may fairly be interpreted to forbid appellant's unauthorized diversion of water.

This statute was effective from 1906 to 1908, inclusive (when the Calumet project was born, its permit applied for and refused, and the Calumet River Suit begun). It required that the amount of *any* diversion of lake water for domestic, sanitary, or navigation purposes be fixed from time to time either by Congress or the Secretary.

Section 1, so far as material, reads (34 Stat. 626, ch. 3621):

> SEC. 1. That the diversion of water from Niagara River or its tributaries, in the State of New York, is hereby prohibited, except with the *consent* of the Secretary of War as hereinafter authorized in section two of this act: *Provided*, That this prohibition shall not be interpreted as forbidding the *diversion* of the *waters of the Great Lakes* or of Niagara River for *sanitary* or *domestic purposes*, or for *navigation*, the amount of which may be fixed from time to time by the Congress of the United States or by the Secretary of War of the United States under its direction.

Section 2 authorizes the Secretary to "grant permits" and "revoke permits" for diversion, and

requires him to make "regulations preventing and limiting the diversion."

Section 3 punishes diversion contrary to the act and provides that—

> the removal of * * * any construction *incidental to or used for such diversion* * * * as well as any diversion of water * * * in violation hereof, may be enforced or enjoined at the suit of the United States * * * instituted under the direction of the Attorney General.

We submit that this act reaches diversion from Lake Michigan at Chicago.

(1) Its prime purpose was to prevent further depletion of the flow at Niagara Falls. Lake Michigan, through Lakes Huron and Erie, was a chief source of supply. The title of the act is "For the construction and regulation of the waters of Niagara River, *for the preservation of Niagara Falls*, and for other purposes." The side notes in 34 Stat. 626, opposite section 1 read: "Niagara Falls; Preservation of. Post, p. 824. Proviso: Diversion of waters." And the reference (34 Stat. 824) is to a resolution of the same Congress passed March 15, 1906, requiring the international commission to report as to—

> what action is * * * necessary and desirable to *prevent the further depletion of the water flow over Niagara Falls.*

And in the committee report submitting the measure, which, with minor amendments, became the present act, and as a substitute for a bill pre-

viously introduced (3 House Rep., 59th Cong. 1st sess., Rep. No. 4654) its object was explained as follows:

> Should Congress decide that in those portions * * * where navigation exists *the water should flow in its present condition, without depletion or diversion*, it would *seem that no judicial or other authority could review its action in the premises.* It is a matter of some surprise that the companies which have proceeded to divert the waters of the river under the authority of the State of New York have never appealed to Congress or to the Federal Government to confirm the authority granted by that State. It is thought best by the committee that the Federal authority should now be exerted, not merely for the preservation of the scenic grandeur of Niagara Falls, but *for the maintenance of navigation* and the proper control of the river as a boundary stream. * * *
>
> It is, however, very desirable, if not essential, that legislation *be now enacted to prevent the further depletion or diversion of the waters of the river* and to furnish a basis for diplomatic action.
>
> In the bill presented a very large responsibility is imposed upon the Secretary of War. This course has been maturely considered and has seemed desirable, because the question of impairment of the scenic beauty of the cataract and of the *interference with navigability* or the integrity of Niagara River as a boundary stream is largely one of hydraulic engineering. *It can not now be determined*

> what quantity of water can be withdrawn without the impairment of the scenic grandeur of Niagara Falls, *nor can it be determined to what extent* such *diversion will interfere with navigability or the integrity of the stream as stated. It is expected that this authority will be exercised by the Secretary of War with strictness.*

This being its general purpose, we must apply the principle of construction that as between two possible readings that must be adopted which will tend to effectuate rather than that which will tend to defeat the purpose of the act. *Virginia* v. *Tennessee*, 148 U. S. 519; *United States* v. *Freeman*, 3 How. 565; *Jones* v. *Guaranty Co.*, 101 U. S. 626.)

(2) Against the application of the act to the Chicago diversion it will be urged that the words in the opening clause of section 1, "that the diversion of water from Niagara River, or its tributaries, *in the State of New York*," limit the scope of the *whole* act to diversions *made somewhere in that State*. Thus read, it would leave the act inoperative as to the chief sources of supply and insufficient to accomplish its purpose. It is not at all necessary so to read it. The words "in the State of New York" may be either treated as *descriptio* as to the river (to distinguish it from any other possible river of like name elsewhere) or they may be made to modify the river alone (whether as description or locally) by merely bracketing the words "or its tributaries" or by transposing them to read "from Niagara River, in the State of

New York or (from) its tributaries." Such reading accomplishes the full purpose of the act.

Indeed, this not only may be, but must be done upon the principle "*noscitur a sociis*"—concerning which in *Virginia* v. *Tennessee*, *supra*, the court (p. 519) says:

> *Noscitur a sociis* is a rule of construction applicable to all written instruments. Where any particular word is obscure or of doubtful meaning, taken by itself, its obscurity or doubt may be removed by reference to associated words.

The proviso of the very same section (1) reading—

> That this prohibition shall not be interpreted as *forbidding the diversion of the waters of the Great Lakes*, or of Niagara River for sanitary or domestic purposes, or for navigation, etc.,

in *its* negative *pregnant* is an implied declaration that it must be interpreted as *forbidding diversion from the Great Lakes for any other purpose.*

In *Cummings* v. *Chicago*, 188 U. S. 410, this court, quoting from *Lake Shore, etc., R. Co.* v. *Ohio*, 165 U. S. 365, said (pp. 429–30):

> The construction claimed for the statute is that its purpose was to deprive the States of all power as to every stream, even those wholly within their borders; whilst the very words of the statute, saying that its terms *should not be construed as conferring* on the States power to give authority to build bridges on streams not wholly within their limits, *by a negative pregnant* with an affirma-

tive, *demonstrate that the object of the act was* not to deprive the several States of the authority to consent to the erection of bridges over navigable waters wholly within their territory.

Turning to the succeeding sections of the act:

The first clause in section 2 authorizes the Secretary to "grant permits for the diversion of water in the United States from said Niagara River, or its tributaries." It may be said that because Niagara River lies between New York State and Canada that the words "in the United States" take the place of the words "in the State of New York" in the earlier section. (We think that their real purpose was to keep the legislation within the jurisdiction of Congress. But if we read it as "from said Niagara River in the United States" equally must we read it as "from its tributaries *in the United States.*) This may not be said, however, of the opening clause of section 3, reading "diverting water from said Niagara River, *or its tributaries,*" since it has no reference either to the State or to the United States, while the language in section 4 providing for negotiations between the United States and Great Britain "for such regulation and control of the waters of the Niagara River and *its tributaries* as will preserve the scenic grandeur of Niagara Falls and of the rapids of said river" would seem to make clear that the tributaries referred to are those wherever located which contribute to the flow of water over the Falls. The act, then, *does* reach diversion of water from Lake Michigan at Chicago.

It remains but to consider what the act commands; and in this case the material mandate is found in the proviso of section 1, *supra*. Applying to its reading the rule laid down in the *Cummings case, supra*, we find that it forbids diversion from the Great Lakes save for three purposes, viz, sanitary, domestic, and navigation, and as to these provides—

> The amount of which [diversion] may be fixed from time to time by the Congress of the United States, *or by the Secretary of War* of the United States under its direction.

Only by compliance with this proviso can a lawful diversion be made from the waters of the Great Lakes. There is no room for misconstruction as to what it demands. The amount of the diversion must be fixed either (1) by Congress or (2) by the Secretary under its direction. Any diversion, or threatened diversion, without such prior fixing of amount, or in excess of an amount so previously fixed, is unlawful and may be enjoined.

The words "under its direction," as applied to the Secretary, mean the direction given to him either in the succeeding section 2 of this act, or like direction given by any other act (such as 1890 or 1899).

In this statute Congress has left no room for the contention that it has deliberately or otherwise relegated to the courts its own function to determine whether an obstruction will or will not be created.

Neither this act nor its proviso contains any reference to obstruction to navigable capacity. And so (under *United States* v. *Chandler-Dunbar Co.*, 229

U. S. 53, 64, supra) the judgment and determination either of the Congress or of the Secretary of War, as its agent, is conclusive as to whether a particular proposed diversion "is or is not an obstruction and a hindrance to navigation;" and the court must enjoin either upon a showing that no application has been made to the Congress or to the Secretary or that if made it has been denied by either. In no other way can the exclusive control of Congress over the subject be preserved.

This act of 1906 operates upon all diversions or work in aid thereof not accomplished prior to its passage.

In reply to appellant's hypercritical construction of the act as meaning that the Secretary of War might *thereafter* limit the diversion and that he did not already have the power, we suggest that counsel read again the case of *United States* v. *Rio Grande Dam & Irrigation Co.*, 174 U. S. 698. In that case there was a *diversion* of water at a point on the Rio Grande River far above its navigable portion; this was held to be not merely a *modification* but an *obstruction*.

C

The Canadian Boundary Waters Treaty of January 11, 1909, did not constitute such authorization; instead, it forbade any diversion over 4,167 c. s. f.

It is difficult to treat patiently with assertions such as are made by counsel for appellant with regard to the intent and effect of the Treaty. The International Waterways did *not* recommend that there should be allowed a diversion of "at *least* 10,000 cubic second

feet of water." (Appellant's Brief, p. 188.) In the report of May 3, 1906, it recommended that the diversion be "not to *exceed* 10,000 cubic feet per second." (Appellant's Narrative, p. 105.) In its report of January 4, 1907, it recommended that "the government * * * *prohibit* the diversion of more than 10,000 cubic feet per second." (Appellant's Narrative, p. 105.)

The International Waterways Commission did *not* find "the Chicago diversion to the amount of 10,000 second feet * * * to be an existing diversion." (Appellant's Brief, p. 190.) This is apparent from the following portions of thier report of January 4, 1907:

> The Chicago Drainage Canal was then constructed, water being turned into it for the first time in January, 1900. It was not then, and has not since been, completed to its full capacity as designed. In some places where the excavation was in rock the full dimensions of the prism were taken out, but in earth a considerable volume was left to be removed by the easy method of dredging hereafter. When fully completed it was designed to have a capacity of 600,000 cubic feet per minute, or 10,000 cubic feet per second, flowing at a velocity of 1.25 miles per hour in earth and 1.9 miles per hour in rock. (Appellant's Narrative, p. 509.)
>
> 10. The channel of the Chicago River is not large enough to transmit that volume from the lake to the canal except at velocities which are an obstruction to navigation. The amount

which the Secretary of War has thus far permitted the sanitary district to pass through the river is 4,167 cubic feet per second. In order to obtain authority for a larger amount the trustees have undertaken to enlarge the channel of the river and have accomplished a large amount of work in that direction. (Appellant's Narrative, p. 510.)

The board assumed that the Chicago Drainage Canal would *eventually* be permitted to take 10,000 cubic feet per second from Lake Michigan. (Appellant's Narrative, p. 512.)

18. The diversion of large bodies of water from Lake Michigan for supplying the drainage canal has not been authorized by Congress. The plans of the sanitary district, except those for the enlargement of the Chicago River, have not been submitted to any Federal authority for approval. It was only after the opening of the canal that application was made to the Secretary of War for permission to divert the quantity of water required by The State law. The secretary granted permission for such quantity as would pass through Chicago River without detriment to navigation, a quantity considerably less than that required by the State law. After experimenting with various amounts it was fixed at 250,000 cubic feet per minute, or 4,167 cubic feet per second, and that is the amount now authorized. It is "subject to such modification as, in the opinion of the Secretary of War, the public interests may from time to time require." Copies of all the permits granted by the Secretary of War in this connection will be found in Appendix I. (Appellant's Narrative, p. 513.)

> There appears to be a tacit general agreement that Chicago needs or *will need* about 10,000 cubic feet of water per second for sanitary purposes and that the city should have it without further question. (Appellant's Narrative, p. 514.)

That 10,000 c. s. f. was not an "existing diversion" is apparent from the testimony as to the actual diversion by appellant from 1900 to 1913. (See Statement of the Case, p. 69.) In 1907 appellant was withdrawing 6,444 c. s. f.; in 1910, 7,132 c. s. f. As a matter of fact, as late as 1909 the appellant *refused* to inform the International Waterways Commission what it was withdrawing. In the report of the Commission of January 8, 1910, it is stated:

> In 1900 the Chicago Drainage Canal began diverting water from Lake Michigan. The amount diverted between January, 1900, and June, 1904, inclusive, was computed from data furnished by the U. S. Engineer Office at Chicago. *The flow through the canal since June, 1904, has been assumed to be 4,167 cubic feet per second, the quantity authorized in the permit of the Secretary of War.* It is believed to have been greater, but the difference is not sufficient to vitiate the results sought for here. An application by the Commission to the Sanitary District of Chicago for a copy of their record met with a refusal to furnish it. (Rec. Vol. VII, p. 253.)

Let us now examine the provisions of the Treaty. Article 2, quoted in Appellant's Brief (p. 189),

preserved the right of citizens of one country to sue in the courts of the other country for damages as to any injury caused by a diversion with the proviso—

> but this provision shall not apply to cases already existing or to cases expressly covered by special agreement between the parties hereto.

Let us assume that this provision prevented any individuals in Canada from suing for an injury caused by an *existing* diversion. The appellant's diversion of 10,000 c. s. f. was *not* an existing diversion. It actually was diverting 6,970 c. s. f. which it was concealing from the knowledge of the International Waterways Commission. Its *authorized* diversion was 4,167 c. s. f. which that Commission assumed to be the *then* flow through the canal. In interpreting the word "existing" as it appeared in the Treaty, were not the negotiators of it justified in assuming that the appellant was obeying the law? The question of an increased diversion had not theretofore been raised directly except by the appellant's application for a permit to divert 4,000 c. s. f. through the Calumet River. This had been denied. Of course, it was known that some day the appellant might ask for 10,000 c. s. f. but it was more than doubtful that the Secretary of War, having refused the Calumet application because of its effect on the lake levels, would ever grant permission to divert this amount.

Furthermore, the right of individuals to sue is a very different matter from the right of their respec-

tive governments in international law. This is apparent from the second paragraph of Article 2 of the Treaty, which is as follows:

> It is understood, however, that neither of the High Contracting Parties intends by the foregoing provision to surrender any right which it may have to object to any interference with or diversions of waters on the other side of the boundary the effect of which would be productive of material injury to the navigation interests on its own side of the boundary. (Appellant's Narrative, p. 532.)

Appellant takes the strange position that this paragraph applies only to *further* diversions, when it plainly states that it applies to *any* diversion and that neither party to the Treaty surrenders the right by anything stated in the first paragraph.

Article 3 of the Treaty reads:

> It is agreed that, in addition to the uses, obstructions, and diversions heretofore permitted or hereafter provided for by special agreement between the Parties hereto, no further or other uses or obstructions or diversions, whether temporary or permanent, of boundary waters on either side of the line, affecting the natural level or flow of boundary waters on the other side of the line, shall be made except by authority of the United States or the Dominion of Canada within their respective jurisdiction and with the approval, as hereinafter provided, of a Joint Commission, to be known as the International Joint Commission.

> The foregoing provisions are not intended to limit or interfere with the existing rights of the Government of the United States on the one side and the Government of the Dominion of Canada on the other, to undertake and carry on governmental works in boundary waters for the deepening of channels, the construction of breakwaters, the improvement of harbors, and other governmental works for the benefit of commerce and navigation, provided that such works are wholly on its own side of the line and do not materially affect the level of flow of the boundary waters on the other, nor are such provisions intended to interfere with the ordinary use of such waters for domestic and sanitary purposes. (Appellant's Narrative, p. 532.)

Appellant after stating that—

> the treaty expressly eliminates from its terms by the preliminary article, Lake Michigan. * * * Obviously, Lake Michigan is not a boundary water, as defined by the Treaty (Appellant's Brief, pp. 188–9)—

later employs the truncated quotation from article 3—

> nor are such provisions intended to interfere with the ordinary use of such waters for domestic and sanitary purposes (Appellant's Brief, p. 189).

Manifestly, if the last sentence applies to Lake Michigan, so also does the first paragraph of article 3, which prohibits any further diversions except with

the approval of the International Joint Commission, a tribunal created by Article 7 of the Treaty.

The Chicago diversion is not "the ordinary use of such waters for domestic and sanitary purposes." The ordinary use consists in such use as causes the water to return eventually to the same channel so that there is no appreciable effect on the level of the water. Chicago is the only city in the world diverting a large-sized river into another watershed. What is so unusual that only one city in the world has done it can hardly be deemed an *ordinary* use. Under appellant's construction of the word, Cleveland may divert Lake Erie into the Ohio River, and each other city on the Great Lakes may do likewise, with the result that these waters become unnavigable because of "ordinary" uses.

Appellant's organic law requires a diversion of 20,000 cu. ft. per minute for each 100,000 of population. If 10,000 c. s. f. is an "ordinary" use, then 25,000 c. s. f. will be an "ordinary" use in 1950.

Counsel for appellant again distorts the provisions of the Treaty by stating:

> Article VIII expressly provides that the uses for domestic and sanitary purposes shall be paramount. (Appellant's Brief, p. 189.)

As a matter of fact, Article 8 provides that—

> The International Joint Commission shall have jurisdiction over and shall pass upon *all* cases involving the use or obstruction or diversion of the waters with respect to which

> under Articles 3 and 4 of this Treaty the approval of this Commission is required. (Appellant's Narrative, p. 535.)

According to appellant, Articles 3 and 4 apply only to *boundary* waters, not Lake Michigan. Article 8 further provides that the Commission shall be governed in *such* cases "by the following rules and principles," included in which is an order of precedence as to uses "for *these* waters." First in the order of precedence is "uses for domestic and sanitary purposes." (Appellant's Narrative, p. 535.)

Where does the Treaty *authorize* or "protect" the Chicago diversion. Article 2 expressly reserves to the United States exclusive control over diversions from Lake Michigan, so long as there is no material injury to Canadian navigation interests. The United States, by entering into the Treaty, did not contract to maintain either the existing diversion of 4,167 c. s. f. or a future diversion of 10,000 c. s. f.

It is useless to cite cases for the elemental proposition that a treaty, under the Federal Constitution, is a law of the land as an act of Congress is. This is only true when the provisions of the treaty prescribe a rule by which the rights of a person may be determined and when such rights are of a nature to be enforced in a court of justice. In *Foster* v. *Neilson*, 2 Pet. 253, this court said (p. 314):

> A treaty is in its nature a contract between two nations, not a legislative act. It does not

> generally effect, of itself, the object to be accomplished; especially so far as its operation is intraterritorial; but is carried into execution by the sovereign power of the respective parties to the instrument. In the United States a different principle is established. Our Constitution declares a treaty to be the law of the land. It is consequently to be regarded in courts of justice as equivalent to an act of the legislature, whenever it operates of itself without the aid of any legislative provision. *But when the terms of the stipulation import a contract—when either of the parties engages to perform a particular act, the treaty addresses itself to the political, not the judicial, department; and the legislature must execute the contract before it can become a rule for the court.*

It is elemental also that there must be *a clear case* of *conflict* between a treaty and a statute.

> Repeals by implication are never favored, and a later treaty will not be regarded as repealing an earlier statute by implication, unless the two are absolutely incompatible and the statute can not be enforced without antagonizing the treaty. (*Johnson* v. *Browne*, 205 U. S. 309, 321.)

There is certainly no "clear case of conflict" between a statute forbidding obstructions to navigable capacity of waters in the United States without authorization from the Secretary of War and the above-quoted provisions of the Treaty.

VI

Appellant's diversion in excess of 4167 c. s. f. has not been recommended by the Chief of Engineers nor authorized by the Secretary of War, as required by section 10 of the act of Congress of March 3, 1899.

Assuming, but not conceding, that the acts of the Appellant are not such as to require affirmative authorization by Congress, there can be no question but that they must be recommended by the Chief of Engineers and authorized by the Secretary of War. They are at least modifications of the course, condition and capacity of navigable waters of the United States. Appellant apparently concedes this.

A mere reading of the various applications of appellant and of the permits granted by the Secretary of War would seem amply sufficient to show how absurd is appellant's contention that it *has* authority from the Secretary of War. It is impossible, however, to point out all the misstatements contained in appellant's brief as to the language, effect, and purpose of these permits. They furnish their own answer to these misstatements.

A

The permits for improvements in the Chicago River prior to May 8, 1899, not only did not include authorization for any diversion of water but expressly withheld it

The permit of July 3, 1896 (the first granted to appellant) authorized appellant to make certain changes in the capacity of the channel of the Chicago River. The permit of November 16, 1897, authorized appellant to widen the Chicago River between

Quincy and Harrison Streets. Both permits contained the following express conditions:

> (2) That the authority shall not be interpreted as approval of the plans of the Sanitary District of Chicago to introduce a current into Chicago River. This latter proposition must be hereafter submitted for consideration.
>
> (3) *That it will not cover obstructions to navigation, by reason of this work while in progress or when completed.* (Rec. Vol. VI, pp. 3574, 3575.)

The second permit recited the provisions of Section 7 of the Act of Congress of 1890 and was expressly granted under that Act (not under the Act of 1827).

The reason for the conditions is apparent not only from the report of the Board of Engineers of August 16, 1895 (see Statement of the Case, p. 30), but also by the report of Major Marshall submitted to the Chief of Engineers of the United States on June 24, 1896 (see Statement of the Case, p. 32), in connection with appellant's application for the first permit. These reports, in no uncertain language, express alarm as to the effect of the diversion even of 300,000 cu. ft. per minute upon the levels of the Great Lakes, and as to whether the United States could do this without the consent of Great Britain. These considerations, as well as the current of the Chicago River, were the reasons for imposing the conditions in the permits. As Major Marshall said:

> *The question that must come up later for the action of the War Department, to wit. Whether*

the improved channel of Chicago River will be sufficient to carry 300,000 cubic feet of water per minute without lessening or destroying the navigability of Chicago River, or whether the City of Chicago will be allowed by the United States and Great Britain to take any water at all from the great lakes, with the inevitable result of lowering their levels is not now under investigation, and is one that will not probably be settled or decided by executive officers. It is or may rather be considered an international question. (Rec., Vol. VI, p. 3573.)

Of course, there was no objection to improving the navigability of the Chicago River as long as no other question was involved. Appellant had full notice then and there that whether it would *ever* be allowed to divert any water, and if so, how much, was uncertain.

B

The permit of May 8, 1899, did not constitute such authorization

1. On April 22, 1899, the appellant applied for permission to open the channel. Its application (Rec. Vol. VI, p. 3848) and the report of Major Marshall which accompanied it (Rec. Vol. VII, pp. 1–2) show that a diversion of 300,000 cu. ft. per minute with a diversion of 1¼ miles an hour was all that was contemplated at the time. Major Marshall was of the opinion, however, that a discharge of 300,000 cu. ft. per minute would lower Lakes Michigan and Huron in an amount which would "not probably much exceed three inches" and that *this much* would not be as serious an injury to navigation as the effect of

the current on the Chicago River. The express recitals in the permit of May 8, 1899 show this. (Rec. Vol. VII, pp. 1–2.) The permit also expressly purports to be issued under Section 10 of the Act of Congress of March 3, 1899 (*not* under the Act of 1827). And it was expressly subject to conditions, one of which was:

> 2. That if, at any time, it become apparent that the current created by such drainage works in the south and main branches of Chicago river, be *unreasonably obstructive* to navigation or injurious to property, the Secretary of War reserves the right to close said discharge through said channel or to modify it to such extent as may be demanded by navigation and property interests along said Chicago river and its south branch.

2. The above quoted condition was not fulfilled. It was represented to the Secretary of War and not denied by appellant, that the discharge sometimes exceeded 300,000 cu. ft. per minute "causing a velocity of nearly three (3) miles per hour, which greatly endangers navigation." The Secretary of War thereupon, by instrument dated April 9, 1901, after reciting the violation of the condition, directed the appellant to limit its discharge to 200,000 cu. ft. per minute. A minor variation was made by order of July 3, 1901, permitting a flow of 300,000 cu. ft. per minute between 4. p. m. and 12 o'clock midnight. On December 5, 1901, acting on another application of Appellant, the Secretary of War granted

what may be regarded as a new permit to divert 250,000 cu. ft. per minute throughout the day, upon the express conditions:

> 1. That this permission shall be in lieu of the present authorized rates of flow as stated above.
>
> 2. That the permission herein given shall be subject to such modification as in the opinion of the Secretary of War the public interests may from time to time require. (Rec. Vol. VII, pp. 4–5.)

On January 17, 1903, an amended permit was granted by the Secretary of War reciting the conditions in the permit of December 5, 1901, and granting authority to divert 350,000 cu. ft. per minute from its date to March 31, 1903, "after which date it shall be reduced to 250,000 cubic feet per minute as now authorized." This permit contained the following condition:

> 1. That the permission herein given shall be subject to such modification as in the opinion of the Secretary of War the public interests may from time to time require.

The Wilmette permit of September 11, 1907, and the Calumet permit of June 30, 1910, both contained express conditions that the total diversion of water by appellant from Lake Michigan into the Illinois River should not exceed the 250,000 cu. ft. per minute already authorized by previous permits. (Rec. Vol. VII, pp. 26, 27–29.)

The permit of May 8, 1899, in its unmodified condition, *is not in force* and has not been in force except during the short period from May 8, 1899, to December 5, 1901 (and then only as modified). The permit of December 5, 1901, was accepted by appellant *in lieu* of the previous permits. Whether or not the permit of May 8, 1899, limited the diversion or not is palpably immaterial.

C

The permits of July 11, 1900, relating solely to improvements in the Chicago River, did not constitute such authorization

On July 11, 1900, the Secretary of War gave permission to appellant to make certain changes in the Chicago River at Lake Street, 12th Street, and Ashland Avenue. Appellant had previously applied for permission to make these changes representing that

> the modification and alteration of said river as above indicated will greatly benefit navigation in said river (Rec. Vol. VII, p. 39)

and saying nothing whatsoever as to its plans to divert an increased amount of water into the canal or connecting the applications in any way with the canal. In fact, the applications merely recited that appellant was a municipal corporation authorized by the State of Illinois

> to enter upon, widen, deepen, and otherwise improve any navigable stream, river, or other waterway.

The permit, however, expressly recited the following:

> It being understood that this statement * * * *does not in any way invalidate, waive, or affect* the right of the Secretary of War to regulate or revoke the permit granted under date of May 8, 1899, to the Sanitary District of Chicago, to divert the waters of the Chicago river and cause them to flow into the artificial channel.

In other words, appellant was granted no more permission or authority than it already had under the permit of May 8, 1899. How, then, can counsel for appellant, in seeming seriousness, make such statements as the following:

> Excavating and filling in the channels of the Chicago River and its branches was the only work appellant was required to do in navigable waters of the United States to accomplish and bring about the diversion. The reversal of the current and flow of the Chicago River and its branches was a *necessary* result. Anyway, this was consented to specifically by the permit of May 8, 1899, for the opening of the canal. The work of improving these channels was done for the purpose only of providing for the abstraction of the water through them in a proper manner. * * *
>
> That includes, of course, the diversion of water to the amount required by State authority (10,000 cubic feet per second). (Appellant's Brief, pp. 131–2.)

D

Appellant, having applied for and accepted the various permits up to and including the Wilmette permit of September 11, 1907, and the Calumet permit of June 30, 1910, and having thus agreed to the conditions on which those permits were issued, is estopped to assert any claim that it is entitled to divert more than 4,167 c. s. f.

It is most astounding that the appellant should seek to invoke principles of estoppel against appellee. (See our Point VIII, infra, p. 270.) It is the *appellant* that is clearly estopped. Appellant has applied for, and has accepted, valuable privileges and authority from the Secretary of War on express conditions. It accepted the privileges and now asserts that it is not bound by the conditions to which it assented!

The permission to connect the North Branch of the Chicago River with Lake Michigan by the Wilmette Canal, and to construct a pile crib in Lake Michigan and to deposit filling within the limits of that crib were only upon condition that the total diversion be limited to 4,167 c. s. f. The permission to connect the Calumet River with appellant's canal and to divert water through it were contingent on the same condition, as well as nine other conditions. May appellant now be heard to contend that it has authority from the Secretary of War or any Federal authority to divert 10,000 c. s. f. or more?

E

The Secretary of War may impose conditions on permits granted by him under Section 10 of the Act of March 3, 1899, and may revoke or modify such permits on nonfulfillment of these conditions

Under its Point III (c) appellant contends that the Secretary of War is only authorized to grant or refuse

a permit; that he has no authority to modify. This contention has recently been disposed of in *Southern Pacific Company et al.* v. *Olympian Dredging Company*, 260 U. S. 205. In speaking of Section 7 of the Act of 1890 this Court said (p. 208):

> That the Secretary of War was authorized to impose the condition heretofore quoted does not admit of doubt. The power to approve implies the power to disapprove, and the power to disapprove necessarily includes the lesser power to condition an approval. In the light of this general assumption by Congress of control over the subject and of the large powers delegated to the Secretary, the condition imposed by that officer can not be considered otherwise than as an authoritative determination of what was reasonably necessary to be done to insure free and safe navigation so far as the obstruction in question was concerned.

See also cases cited under Point III, E and F.

VII

Appellant's unauthorized diversion of more than 4167 c. s. f., with its consequent effect on the level of the Great Lakes and on the condition of the Chicago, Calumet, and Des Plaines Rivers, can not be justified as an exercise of the police power reserved to the State.

In its Point IV appellant seeks to avoid the effect of Section 10 of the Act of Congress of 1899 "by simply invoking the convenient apologetics of the police power." (*Kansas City S. R. Co.* v. *Kaw Valley Drainage Dist.*, 233 U. S. 75.) Curiously, however, appellant concedes at the outset that Congress *may* "occupy the entire field concerning

the regulation of navigable waters of the United States" (Appellant's Brief, p. 152). Apparently, therefore, appellant's contention is that the cases which hold that by its Acts of 1890 and 1899 Congress *has* asserted its paramount control and "meant that thereafter no state should interfere with the navigability of a stream without the condition of national consent" (*United States* v. *Rio Grande Dam & Irrigation Co.*, 174 U. S. 698) are *wrong* and should be overruled with respect to the obstruction created by appellant. To express the contention in another way, appellant may create an obstruction, no matter how great, if it does so for the supposed interest of public health. An equal obstruction, caused by anyone else in the exercise of some other object of the police power of the state, such as the improvement of its interior navigation, would be unlawful.

No such distinction is made by Congress. The object of its legislation was the preservation of the navigable capacity of navigable waters of the United States. "The language is general and must be given full scope." (*United States* v. *Rio Grande Dam & Irrigation Co., supra.*) *All* obstructions and *all* modifications are unlawful. Whatever the individual states might have done with respect to obstructing navigable waters wholly within their boundaries, in the exercise of their police powers, that power could not thereafter be exercised without national assent. Congress did not intend to make an exception of one object of police power as against any others.

The unqualified use of the word "obstruction" leaves no room for the exercise of any police power to create an obstruction without national assent. It may be conceded that the word "modification" does not cover the ordinary use of a navigable water such as might have been made by an upper riparian owner in a state where riparian rights are recognized (as distinguished from the rule of prior appropriation which obtains in certain western states). The ordinary use is such as preserves the full flow of the river, without any appreciable modification. We are not interested in the present case in determining the right of an upper riparian owner or city to discharge sewage into the river to the detriment of a lower riparian owner or city. That is a matter concerning individuals or cities. The United States *is* interested in preserving the full, unmodified navigable capacity of its navigable waters. The ordinary use which a riparian owner or city would make of such waters does not involve any appreciable effect on their navigable capacity; in the ordinary case the land on which the riparian owner or city is located *drains* into the same navigable water, and while it may not be as pure, its availability for navigation is unaffected.

The appellant is not making an *ordinary* use of the navigable waters along which the City of Chicago is located. An *ordinary* use is such as Milwaukee, Detroit, Cleveland, and other cities on the Great Lakes are making. Appellant is diverting the equivalent of *three* navigable rivers of the United States,

into another watershed, and now pleads the police power of the state as sanctioning the injury it is inflicting on navigation affecting the entire nation as well as a foreign nation. The fact that Chicago is the *only* city in the entire world which has adopted this method certainly answers appellant's assertion that this is an exercise of a supposed police power to make ordinary or reasonable use of the water.

When appellant asserts that its Enabling Act of 1889 rests upon the police power of Illinois never delegated to the Federal Government, and that its objects were "*first*, the protection of public health; *second*, the improvement of the state's waterways" (Appellant's Brief, p. 155) it is disregarding such elemental and well-established principles that it seems unnecessary to discuss them in detail. The cases cited and quoted by us under our Points II and III are an effective answer to these assertions. We shall, therefore, limit ourselves to a brief mention of the principles and leading cases which are conclusive of the matter.

A

On a subject of interstate commerce national in character and requiring exclusive control by Congress, there is not, and never has been, any reserved police power in the State to invade that control even for the protection of public health

In *Henderson* v. *Mayor of New York*, 92 U. S. 259, this Court held invalid a statute of New York which was for the purpose of preventing the immigration of diseased paupers. We quote from the opinion:

> But assuming that, in the formation of our government, certain powers necessary to the

administration of their internal affairs are reserved to the States, and that among these powers are those for the preservation of good order, of the health and comfort of the citizens, and their protection against pauperism and against contagious and infectious diseases, and other matters of legislation of like character, they insist that the power here exercised falls within this class, and belongs rightfully to the States.

This power, frequently referred to in the decisions of this court, has been in general terms, somewhat loosely called the police power. It is not necessary for the course of this discussion to attempt to define it more accurately than it has been defined already. It is not necessary, because whatever may be the nature and extent of that power, where not otherwise restricted, *no definition of it and no urgency for its use can authorize a State to exercise it in regard to a subject-matter which has been confided exclusively to the discretion of Congress by the Constitution.*

Nothing is gained in the argument by calling it the police power. Very many statutes, when the authority on which their enactments rest is examined, may be referred to different sources of power, and supported equally well under any of them. A statute may, at the same time, be an exercise of the taxing power and of the power of eminent domain. A statute punishing counterfeiting may be for the protection of the private citizen against fraud, and a measure for the protection of the

currency and for the safety of the government which issues it. It must occur very often that the shading which marks the line between one class of legislation and another is very nice, and not easily distinguishable.

But, however difficult this may be, it is clear from the nature of our complex form of government, that, whenever the statute of a State invades the domain of legislation which belongs exclusively to the Congress of the United States, it is void, no matter under what class of powers it may fall, or how closely allied to powers conceded to belong to the States (pp. 271–272).

See also *Kansas City S. R. Co.* v. *Kaw Valley Drainage Dist.*, 233 U. S. 75.

B

On all other subjects of interstate commerce, when Congress has asserted its paramount control, there is no police power reserved in the State to invade that control

Appellant in effect asserts that the State of Illinois has not surrendered to the Federal Government control over, or power to interfere with, interstate commerce or the navigable capacity of navigable waters, with respect to the protection of public health and the improvement of the state's waterways.

(1) THE PROTECTION OF PUBLIC HEALTH

In *Morgan, etc., Co.* v. *Louisiana Board of Health*, 118 U. S. 455, 464, this Court said:

We do not think it necessary to enter into the inquiry whether, notwithstanding this, it is to be classed among those police powers which were retained by the States as ex-

clusively their own, and, therefore, not ceded to Congress. For, while it may be a police power in the sense that all provisions for the health, comfort, and security of the citizens are police regulations, and an exercise of the police power, it has been said more than once in this court that, even where such powers are so exercised as to come within the domain of federal authority as defined by the Constitution, the latter must prevail. *Gibbons* v. *Ogden*, 9 Wheat. 210; *Henderson* v. *Mayor*, 92 U. S. 272; *New Orleans Gas Co.* v. *Louisiana Light Co.* 115 U. S. 661.

But it may be conceded that whenever Congress shall undertake to provide for the commercial cities of the United States a general system of quarantine, or shall confide the execution of the details of such a system to a national board of health, or to local boards, as may be found expedient, all state laws on the subject will be abrogated, at least so far as the two are inconsistent.

See also *Compagnie Francaise* v. *Louisiana Board of Health*, 186 U. S. 380, and *Louisiana* v. *Texas*, 176 U. S. 1, 19, in which this Court said:

> vindication of the freedom of interstate commerce is not committed to the state of Louisiana.

(3) FOR THE IMPROVEMENT OF THE STATE'S WATERWAYS

We assume that in speaking of the "State's Waterways" counsel for appellant have reference to rivers such as the Chicago, Calumet, and Desplaines Rivers which, while wholly within the boundaries of

the state, are yet navigable waters of the United States. We concede that waters having no interstate communication, such as an interior lake in Illinois having no navigable outlet, is subject to the state's power. That counsel, in the face of the Acts of Congress of 1890 and 1899, should contend that the State still has the right to improve navigable waters of the United States within its limits, without national assent, seems incredible in the light of the sort of "improvement" we are discussing. This particular question was, however, settled in *Mobile County* v. *Kimball*, 102 U. S. 691, 697–699:

> Of the class of subjects local in their nature, or intended as mere aids to commerce, which are best provided for by special regulations, may be mentioned harbor pilotage, buoys and beacons to guide mariners to the proper channel in which to direct their vessels.
>
> * * * * *
>
> That power which every State possesses, sometimes termed its police power, by which it legislates for the protection of the lives, health, and property of its people, would justify measures of this kind.
>
> * * * * *
>
> Where, from the nature of the subject or the sphere of its operation, the case is local and limited, special regulations adapted to the immediate locality could only have been contemplated. State action upon such subjects can constitute no interference with the commercial power of Congress, for when that acts the State authority is superseded. Inaction of Congress

> upon these subjects of a local nature or operation, unlike its inaction upon matters affecting all the States and requiring uniformity of regulation, is not to be taken as a declaration that nothing shall be done with respect to them but is rather to be deemed a declaration that for the time being, and until it sees fit to act, they may be regulated by state authority.

See also *Wisconsin* v. *Duluth*, 96 U. S. 379.

Incidentally, appellant persists in confusing the amount of diversion necessary for sewage disposal with the amount necessary to provide for a navigable canal. According to appellant's witnesses the former requires 10,000 c. s. f. According to the record, the latter requires 1,000 c. s. f. (Appellant's Narrative, p. 33; also see Rec. Vol. VI, pp. 3633–34; Vol. VII, p. 54.)

As authority for its contentions under this heading counsel cite *Cummings* v. *Chicago*, 188 U. S. 410; *Montgomery* v. *Portland*, 190 U. S. 89; and other cases which do not even remotely sustain its contention. They are discussed elsewhere (*supra*, p. 170).

It hardly seems necessary to distinguish the cases cited by appellant under its Point IV (b). Not one of them is in point. *New York* v. *Miln*, 11 Pet. 102, was overruled in *Henderson* v. *Mayor of New York*, 92 U. S. 259. None of the cases has to do with an attempted exercise of state authority in conflict with an assertion of paramount control by Congress.

Under its Point IV (c) appellant contends that "Congress has otherwise by legislation indicated that

it was not its intention to prohibit the operation of appellant's diversion works" (Appellant's Brief, p. 176). This question is not appropriate to a discussion of the state's supposed police power and we are treating it elsewhere. The supposed acquiescence of Congress is treated under our Point VIII (infra, p. 267).

The effect of the Niagara Falls Act is treated under our Point V, B. (supra, p. 219). The reports of the International Waterways Commission and the Canadian Boundary Water Treaty are discussed under our Point V, C (supra, p. 226). We pause only to call attention to the recurrent misstatement that—

> This Commission [the International Waterways Commission] found the diversion of 10,000 second feet to be an existing fact. (Appellant's Brief, p. 178.)

That this is not true, see page 227 *supra*.

Appellant's interpretation of "the only purpose" of the resolution of Congress of April 21, 1904 (Appellant's Brief, p. 178), is, of course, without foundation in the record.

In conclusion we may appropriately call attention to remarks that this Court has made in other cases, in respect to appellant's contention. In *Wilkerson v. Rahrer*, 140 U. S. 545, this Court said (p. 557):

> That which does not belong to commerce is within the jurisdiction of the police power of the State; and that which does belong to commerce is within the jurisdiction of the United States.

In *Wisconsin* v. *Duluth*, 96 U. S. 379, 386–387, this Court said:

> We do not feel called upon to make an argument to prove that these statutes of the Congress of the United States, and these Acts of the Executive Department in carrying those statutes into effect, constitute an adoption of the canal and harbor improvement started by the City of Duluth, and a taking exclusive charge and control of it; that they amount to the declaration of the Federal Government, that we here interpose and assert our power; we take upon ourselves the burden of this improvement, which properly belongs to us, and that hereafter this work for the public good is in our hands and subject to our control.
>
> If the merest recital of these Acts of Congress, and of the War Department under them, do not establish that proposition, we can have little hope of making it plain by elaborate argument.
>
> Nor can there be any doubt that such action is within the constitutional power of Congress. It is a power which has been exercised ever since the government was organized under the Constitution. The only question ever raised has been, how far and under what circumstances the exercise of the power is exclusive of its exercise by the States. And while this court has maintained, in many cases, the right of the States to authorize structures in and over the navigable waters of the States, which may either impede or improve their navigation, in the absence of any action of the General Government in the same matter, the doctrine

> has been laid down with unvarying uniformity, that when Congress has, by any expression of its will, occupied the field, that action was conclusive of any right to the contrary asserted under state authority. The adjudged cases in this court on this point are numerous.

In *United States* v. *Chandler-Dunbar Water Power Co.*, 229 U. S. 53, this Court said (p. 62):

> All means having some positive relation to the end in view which are not forbidden by some other provision of the Constitution are admissible.

In *Wabash St. L. & P. Ry. Co.* v. *Illinois*, 118 U. S. 557, this Court said (p. 577):

> And if it be a regulation of commerce * * * it must be of that national character, and the regulation can only appropriately exist by general rules and principles, which demand that it should be done by the Congress.

VIII

The right of Appellee to an injunction is not barred by laches, acquiescence, or estoppel

That appellee should be called upon to meet any such contention as is made in Point V of appellant's brief, is not without its humorous side. If ever a party to litigation were estopped from setting up a claim, it is appellant—by reason of its acceptance of the benefits and the conditions of the various permits and particularly the Wilmette and Calumet permits.

We shall not again set forth the facts (to which we have already been forced to make too frequent ref-

erence) bearing on appellant's charge of acquiescence, etc. They are reviewed in our Statement of the Case (*supra*, p. 21), and may be summarized as follows:

(1) No work in the building of the Canal was done until after the passage of the Act of September 19, 1890, which required the authorization of the Secretary of War for the modification of the condition of the navigable waters of the United States.

(2) The necessity for federal cooperation was stated to the appellant by the Government Engineering Department in 1892, prior to the commencement of work on the canal.

(3) The paramount control of the Government with respect to navigation was again asserted by the Government Engineering Department in 1893, immediately following the commencement of work on the canal.

(4) The question of the effect upon lake levels and the navigable capacity of the lakes and their connecting rivers was raised specifically by the Government Engineering Department in 1895, and notice with reference thereto was given to the appellant. This was during the early stages of the work, and long before the completion of the main channel of the canal. The Board made a report, in which the effect of the withdrawal was stated, and the control of the United States asserted.

(5) In 1896, when the appellant sought a permit to make changes in the Chicago River, it was stated in the official records that the question of whether

the District would be allowed by the United States and Great Britain to take any water at all from the Great Lakes, was one which must come up later for the action of the War Department, and in the permit, which was granted, it was expressly stated that it was not to cover obstructions to navigation by reason of the work while in progress or when it was completed. Of the grand total of over seventy-five million dollars which the appellant claims to have expended upon this work, less than twelve million dollars had been expended at this time. Of course, in drawing any comparison between the extent of the injury to navigation and the injury to the appellant in case it is not permitted to withdraw the water, the appellant, in any view of the situation, is limited to the amount it had expended at the time this permit was accepted and acted upon.

(6) From 1896 until the completion of the channel the appellant accepted and acted upon permits which, in express terms, recited the paramount authority of the Federal Government over modifications of the condition of navigable waters, and which provided that they were not to cover obstructions to navigation when the canal was completed.

(7) The Act of 1899, strengthening the authority of the United States officers and making the authorization of Congress itself necessary to the creation of an obstruction to navigable capacity, was passed prior to the completion of the main channel and before application was made for a permit to connect the canal with the Chicago River, and therefore prior

to the time when the question of the effect of the withdrawal of the water was presented in a way which called for a ruling.

(8) In the draft of permit which the appellant submitted on April 22, 1899, and which it requested the Government to issue, it is expressly recited that it is necessary, under the existing law, that authority should issue from the War Department under which the appellant might cause the waters of the Chicago River to flow to the west into the main channel of the canal. In the permit of May 8, 1899, the paramount authority of the Government is distinctly asserted, and the appellant accepted the benefit of this permit.

(9) The permit of May 8, 1899, was modified from time to time by the United States, sometimes upon its own motion and sometimes at the request of the appellant. These modifications, which in every case asserted the paramount authority of the Federal Government, were accepted by the appellant, and the benefits thereunder were enjoyed by the appellant.

(10) After the application to reverse the flow of the Calumet River was denied, in 1907, the appellant applied for and obtained a permit to withdraw water from Lake Michigan through the Wilmette branch of its canal. This permit expressly recited that the total amount to be withdrawn from the lake should not exceed the amount then authorized. The appellant accepted this permit with this condition, and then, on September 18, 1907, passed the order in

which it denied the authority of the United States to withhold the water which was required for the purposes of sanitation.

(11) The Calumet River suit was instituted on March 23, 1908, following appellee's defiance of authority by proceeding to construct the Calumet-Sag Canal. The bill of complaint alleged the intention of appellant to divert 4,000 c. s. f. through that canal; that the effect would be to lower the level of Lake Michigan, etc., and to modify the condition and obstruct the capacity of navigable waters of the United States. The prayer of the bill was for an injunction restraining appellant from reversing the flow of the river and from withdrawing from Lake Michigan any water except as authorized by the Department of War (amount of water thus authorized being then 4,167 c. s. f.).

(12) The actual diversion by appellant from 1900 to 1913, according to appellant's chief engineer, was as follows:

Year	Cubic second-feet
1900	4,314
1901	4,437
1902	4,569
1903	5,144
1904	5,271
1905	5,381
1906	6,292
1907	6,444
1908	6,596
1909	6,970
1910	7,132
1911	7,295
1912	7,458
1913	7,619

(Rec. Vol. III, p. 1318.)

The above shows that in 1900 the appellant did not take as much as 300,000 cubic feet per minute, and that for several years thereafter it was not diverting enough more than 250,000 to be apparent to the eye. As late as 1909, the appellant refused to give to the International Waterways Commission access to its records or information as to the amount of its withdrawal. The report of the International Waterways Commission of January 8, 1910 (Rec. Vol. VII, p. 253) indicates that the U. S. Engineer Office at Chicago had figures showing the diversion from January, 1900, to June, 1904, but that beyond that date figures were unobtainable. The Commission assumed "that the flow through the canal since June, 1904, * * * to be 4,167 cubic feet per second, the quantity authorized in the permit of the Secretary of War."

(13) The permit to reverse the flow of the Calumet River was obtained in 1910 upon the express understanding that it should not be used in any way to affect the pending litigation with respect to the withdrawal of water through the Calumet River, and contained a similar restriction on the total diversion.

(14) In 1912 the appellant made application to the Secretary of War for a permit to withdraw 10,000 cubic feet per second from Lake Michigan through its various channels. There was a formal hearing upon this application at which the Canadian Government was represented. The claims of the Canadian Government were presented, and the appellant replied to those claims. There was a finding by the

Secretary of War upon the claims of Canada as to injury to its navigable waters.

(15) The decision of the Secretary of War was rendered January 8, 1913. On October 6, 1913, the Main Channel suit was instituted.

(16) None of the delays in the prosecution of either the Calumet River suit or the Main Channel suit are due to appellee. They are due (1) to delays caused by appellant, and (2) the unwillingness of Judge Landis to render an immediate decision. (Rec. Vol. VIII, p. 149.)

It is submitted that these facts do not show any authority from the United States for the diversion of this water, or any acquiescence in the act of the appellant; on the contrary, they show a recognition by the appellant of the paramount right of control on the part of the United States which is asserted in this case.

Appellant also seeks to construct some sort of invitation from the United States by citing extracts from reports of Government engineers. It may be conceded that for nearly fifty years the question of the improvement of navigation between Lake Michigan and the Mississippi river has been under consideration. There have been many surveys; many projects have been discussed; tentative plans have been stated, but there has never been any specific plan adopted by the Engineer Department or authorized by Congress. An examination of the Government surveys and reports shows that they are utterly different in their nature from the appellant's

project, and they cannot be interpreted as an invitation to divert from Lake Michigan ten times the quantity of water required for purposes of navigation under any project that has received consideration. (See Rec. Vol. IV, p. 2240, 2248, 2249, 2252, 2254, 2259–61, 2165–66, 2371–2372, 2183, 2204, 2579–80, 2582–2603.)

It is significant that the Bridge Company in the *Wheeling Bridge Case*, 13 How. 553, made exactly the same contentions (p. 558):

> * * * that the bridge is a connecting link of a great public highway, as important as the navigation of the Ohio River; that Pennsylvania had set the example of authorizing bridges across the Ohio; that certain engineers of the United States had recommended a wire suspension bridge at Wheeling, and gave as their opinion that "by an elevation of ninety feet, every imaginable danger of obstructing the navigation would be avoided"; that certain reports of committees in Congress recognized the necessity of a bridge at Wheeling, and recommended an appropriation for that purpose; that the headway for steamers left by the bridge is amply sufficient, forty-seven feet above the water, for all useful purposes; and if sufficient draught can not be had at that height, blowers might be added; that chimneys might have hinges on them; so as to be lowered without much inconvenience; that the bridge will not be an appreciable inconvenience to the average class of boats; that the bridge will not diminish or destroy trade between

> Pittsburgh and other ports, or do irreparable injury to the citizens of Pennsylvania.

In view of the fact that these contentions were all passed upon unfavorably by this Court in that case, there seems little room for appellant's present claims in this regard.

We now call attention to sell-settled principles which are, we submit, conclusive against all claims of estoppel, etc., on the part of appellant.

A

Any contention that appellee's right to an injunction is barred by laches is untenable

1. Even as between private persons where delay is induced by act or representation of one person, the doctrine of laches is never applied in his favor against the other. In *Loring* v. *Palmer*, 118 U. S. 321, 345–6, the Court said:

> His delay in bringing the suit is to be construed in connection with the uncertainty that existed as to the true situation of his accounts. Loring must have known that Palmer relied on him to keep the accounts, and having himself been guilty of such glaring errors in his statements and in his claims, Palmer is not to be charged alone with the fault of delay. * * * It is clear that, if Palmer had known the actual condition of the accounts at the time, he would promptly have claimed his rights, and that, to say the least, Loring was as much responsible for this uncertainty as Palmer.

In *Townsend* v. *Vanderwerker*, 160 U. S. 171, 186, this Court said:

> The question of laches does not depend, as does the statute of limitation, upon the fact that a certain definite time has elapsed since the cause of action accrued, but whether, under all the circumstances of the particular case, plaintiff is chargeable with a want of due diligence in failing to institute proceedings before he did. In this case we think the delay is fully explained.

In *Gunton* v. *Carroll*, 101 U. S. 426, 429:

> The delay in making it [a partition which was prerequisite to suit for specific performance] was that of Carroll and of his devisees. For this the complainants were in no manner chargeable with laches and should receive no detriment. (Citing cases.)

2. Laches, however long continued, is not imputable against the United States to bar it of its sovereign rights. In *United States* v. *Kirkpatrick*, 9 Wheat. 720, 735, this Court said:

> The general principle is that laches is not imputable to the Government; and this maxim is founded, not in the notion of extraordinary prerogative, but upon a great public policy. The Government can transact its business only through its agents; and its fiscal operations are so various and its agencies so numerous and scattered, that the utmost vigilance would not save the public from the most serious losses, if the doctrine of laches can be applied to its transactions.

In the case of *United States* v. *Beebe*, 180 U. S. 343, 354, this Court said:

> Generally speaking, the laches of officers of the Government can not be set up as a defense to a claim made by the Government. (Citing cases.)

In *Armstrong* v. *Morrill*, 14 Wall. 120, 144–5, this Court said:

> But the court held that the limitation (a restrictive condition) could not be extinguished by any inattention or neglect in compelling the owner to comply with it, for no laches is to be imputed to the Government and against it no time runs so as to bar the public rights, which is no more nor less than another form of words for expressing the ancient rule of the common law that time does not run against the State.

See also *United States* v. *Dalles*, M. R., 140 U. S. 632; *United States* v. *Insley*, 130 U. S. 263; *Metropolitan Ry. Co.* v. *District of Columbia*, 132 U. S. 11; *United States* v. *Michigan*, 190 U. S. 405; *Redfield* v. *Parks*, 132 U. S. 243–4. In the last case it was held that State legislation could not operate to change this rule, the Court saying (pp. 243–4):

> The foundation of this rule is the proposition that time does not run against the Government, that no statute of limitation affects the rights of the Government, unless there is an express provision to that effect in the statute, and even then it can not be conceded that State legislation can in this manner imperil

> the rights of the United States or overcome the general principle that it is not amenable to the statute of limitations or the doctrine of laches.

In the case of *United States* v. *Michigan*, *supra*, a case very like the case at bar, involving a grant in aid of a canal, and authorizing statutes of the State of Michigan, the existence of those statutes did not prevent the application of the rule here contended for. The case of *Missouri* v. *Illinois* and *Sanitary district*, 180 U. S. 208, involved the very State legislation and district powers that are involved in this case. It was urged against the right of Missouri to complain of the flow of sewage that it was barred by reason of laches and the action taken and expenditures made under the State legislation. It was contended on behalf of the defendants—

> if the bill was not prematurely filed, then it was filed too late; that by standing by for so long a period the complainant was guilty of such laches that a court of equity will not grant relief.

Of this claim the court said (p. 245):

> The inconsistency between these contentions is manifest, and on consideration we are of opinion that the suggestion that the complainant's remedy has been lost by delay, is not founded in fact or reason.

(See also same case, 200 U. S. 496, 520.)

B

Any contention that appellee's right to an injunction is barred by acquiescence is untenable

1. This feature so far as it involves alleged non-action during the period the appellant was operating under the State statutes and later making expenditures on the original project is disposed of by *Union Bridge Co.* v. *United States*, 204 U. S. 364, 400, as follows:

> There are no circumstances connected with the original construction of the bridge, or with its maintenance since, which so tie the hands of the Government that it can not exert its full power to protect the freedom of navigation against obstructions. Although the bridge, when erected under the authority of a Pennsylvania charter may have been a lawful structure, and although it may not have been an unreasonable obstruction to commerce and navigation as then carried on, it must be taken under the cases cited, and upon principle, not only that the company when exerting the power conferred upon it by the State, did so with knowledge of the paramount authority of Congress to regulate commerce among the States, but that it erected the bridge subject to the possibility that Congress might, at some future time, when the public interest demanded, exert its power by appropriate legislation to protect navigation against unreasonable obstructions. Even if the bridge, in its original form, was an unreasonable obstruction to navigation, the mere failure of the United States, at the

> time, to intervene by its officers or by legislation and prevent its erection, could not create an obligation on the part of the Government, etc. * * * Its mere silence or inaction when individuals or corporations, under the authority of the State, place unreasonable obstructions in the waterways of the United States, can not have the effect to cast upon the Government an obligation not to exert its constitutional power to regulate interstate commerce.

In *Rundle* v. *Canal Co.*, 14 How. (U. S.) 92, the court quotes the Supreme Court of Pensylvania, as follows:

> And, in this respect, a grant by a public agent of limited *powers, and bound not to throw away the interests confided to it,* is different from a grant by an individual who is master of the subject. To revoke the latter after an expenditure in the prosecution of it, would be a fraud. *But he who accepts* a license from the legislature, knowing that he is dealing with an agent bound by duty not to impair public rights, does so at his risk; and a voluntary expenditure on the foot [faith] of it gives him no claim to compensation.

So far as it involves action or omission by officers or Congress, the matter will be treated under "Estoppel" *infra*, p. 270.

2. Acquiescence in work or expenditures while there was no suggestion of *use of more than permitted* quantities of water is no estoppel to object to a *later plan calling for greater* quantities of water. Nor does acquiescence, as to the Chicago River, estop to object

to a later plan to change the channel or current of the *Calumet*, any more than acquiescence in a Chicago project would estop to object to a Milwaukee project.

In *Los Angeles W. Co.* v. *City*, 88 Fed. 720, 745–6, the court said:

> Defendants further contend that complainants have so acquiesced in the action of the council in the fixing of water rates as to estop them * * * and also have been guilty of such laches * * * as is fatal. * * * This contention, in my opinion, is not well taken. * * * But, even if the complainants had not protested, *their acquiescence in ordinances establishing rates prior* to the year 1896 *would not be acquiescence in the ordinance* of that year, for the obvious reason that the last-named ordinance *made a greater reduction of rates than any previous* ordinance.

3. Moreover, having itself induced the appellee's delay by its methods and representation, the appellant is estopped from urging either delay or acquiescence.

Bridge Co. v. *United States*, 105 U. S. 482.
Branch v. *Jesup*, 106 U. S. 468.
International Contracting Co. v. *Lamont*, 155 U. S. 309–10.
Moran v. *Comm.*, 2 Black 732.
Wallace v. *Loomis*, 97 U. S. 163.
County v. *Barnes*, 94 U. S. 70, 73.
and cases cited *supra* under sub-heading A (1), supra, p. 263.

4. Finally, while you may balance equities through expenditures, as between two *otherwise equal* rights or powers, to determine superiority, this may *never*

be done between a *superior and inferior power or right*, because the superior power must always be superior, and there is nothing to be determined. (In re *Rahrer*, 140 U. S. 555, 556, 557; *Houston & Texas Ry.* v. *United States*, 234 U. S. 350, 351, 352.)

C

Any contention that appellee's right to an injunction is barred by estoppel is untenable

There can be no estoppel against the Government in this case, because (1) the acts complained of constitute a public nuisance; (2) a revocable license can never support an estoppel; (3) officers whose acts are relied on have no power to grant the privilege; (4) mere appropriations to *investigate* are immaterial; (5) cooperation in improving Chicago River was merely for betterment of navigation; (6) toleration of other diversion or diversions by Government is immaterial; (7) there was not a dollar spent on later Calumet project on the faith of any congressional action.

We have dealt elsewhere (Point V, supra, p. 203) with the contention that the Act of Congress of 1827 relating to the Illinois and Michigan Canal, the Boundary Waters Treaty, and the Niagara Falls Act can be construed as authority for appellant's unlawful acts.

(1) ESTOPPEL CAN NEVER BE URGED IN FAVOR OF A PUBLIC NUISANCE

Any unlawful interference with navigation is a public nuisance *per se*.

The author, Joyce, on Nuisances, defining the terms, says, A nuisance consists in unlawfully doing any act which (3) unlawfully interferes with or obstructs, or tends to obstruct, any navigable lake, reservoir, etc. (sec. 4, pp. 8–9), and such anuisance (per se) is an obstruction to a navigable stream. (Sec. 12, p. 20.)

In *Phalen* v. *Virginia*, 8 How. (U. S.) 163, this court said (p. 168):

> It is a principle of the common law, that *the king can not sanction a nuisance.*

In *People* v. *Gold Run D. & M. Co.*, 66 Cal. 152, this court said:

> As to the claim of right derived from prescription and the statute of limitations, it is sufficient to say that a right to continue a public nuisance can not be acquired by prescription. (Citing cases.) Nor can it be legalized by lapse of time * * *. Against it, however long continued, the State is bound to protect the people. * * * (Noting *People* v. *Booth*, 32 N. Y. 397.) "For all the people of the State are interested in the question, and have the right to use all bays and navigable rivers within the State."

In *Missouri* v. *Illinois and Sanitary District*, 180 U. S. 242–3, this court said:

> In the first place, it is urged that the drawing, by artificial means, of the sewage of the city of Chicago into the Mississippi River may or may not become a nuisance * * *.

The court then cites *Attorney General* v. *Jamaica Pond Aq. Corp.*, 133 Mass. 361, which action was to enjoin defendants from lowering the waters in one of the public ponds of Massachusetts, and it quotes from the opinion in that case, as follows, p. 363:

> The cases are numerous in which it has been held that the attorney general may maintain an information in equity to restrain a corporation exercising the right of eminent domain *under a power delegated to it by the legislature*, from any abuse or perversion of the powers which may create a public nuisance or injuriously affect or endanger the public interests.

The closing language in the court's opinion (p. 248) in the main case (Sanitary District case) is not apposite here because (1) Missouri had no power superior to that of Illinois; (2) any substantial interference with a superior power warrants and demands injunctive protection.

(2) ESTOPPEL IS NEVER APPLIED WHERE, HAD A PRIVILEGE BEEN GRANTED, IT MUST HAVE BEEN REVOCABLE ONLY

In *Rundle* v. *Canal Co.*, 14 How. (U. S.) 92–3, involving a legislative grant to build a mill dam in a navigable river, which dam was rendered useless by a later authorized canal, this court quotes from the Supreme Court of Pennsylvania in a like case, as follows:

> "He was bound to know that the State had power to revoke its license whenever the

> paramount interests of the public should require it. * * * But he who accepts a license from the legislature knowing that he is dealing with an agent bound by duty not to impair public rights, does so at his risk * * *." [The court itself then continues:] Nor can the plaintiff claim by prescription against the public for more than the act confers on him, which is at best impunity for a nuisance.

In *Doyle* v. *Continental Insurance Co.*, 94 U. S. 535, 540–2, this court said:

> The correlative power to revoke or recall a permission is a necessary consequence of the main power * * * [citing cases] This is justifiable because the complainant has no constitutional right to do business in that State. * * * This is the whole point of the case, and, without reference to the injustice, the prejudice, or the wrong that is alleged to exist, must determine the question. No right of the complainant * * * is infringed, etc.

In *Morris* v. *United States*, 174 U. S. 196, 282, this court said:

> Here we may pause to observe that the only power given to the commissioners was to grant *licenses*, from time to time, and *until* Congress should assume and exercise its jurisdiction within the territory, and it was declared that any wharf built in the waters of the Potomac without such license or in disregard of its provisions, was declared to be a common nuisance.

> The licenses contemplated therefore were temporary, and liable to be withdrawn by Congress on assuming jurisdiction. Such legislation certainly can not be relied on as either conferring or recognizing rights to erect and maintain permanent wharves within the waters of the Potomac and the Eastern Branch.

The appellant was bound to know when it turned toward these navigable waters that though it gained permits they could never pass more than a revocable license. Unless it was willing to take that hazard, it was bound to seek out and develop some other system. Here there was not only *express* refusal to permit any of the acts here complained of, but such permits as were given were accompanied by such conditions as amply justified the later refusals.

In *Lowndes* v. *Huntington*, 153 U. S. 32, involving a claim of right to use a navigable bay for oyster cultivation, this court said:

> In other words, all he claims is that he had an implied license from the State; but such license (if one existed) was subject to revocation and was revoked, etc.

In *St. Anthony Falls W. P. Co.* v. *St. Paul W. Comm.*, 168 U. S. 349, 372–3, wherein the power company *claimed property rights* under State charter in navigable waters, this court said:

> These grants were in legal effect subject at all times to the paramount right of the State as trustee for the public to divert a portion of the waters for public uses, and they were also

> subject to the rights in regard to navigation and commerce existing in the General Government under the Constitution of the United States. [Citing cases.]
>
> * * * This construction * * * assumes the power of a * * * legislature to bind future legislatures in dealing with these public rights * * * (which, under the decision of this court in *Illinois Central Railroad* v. *Illinois*, 146 U. S. 387, is at least doubtful), etc.

The court then cites and approves *Rundle* v. *Canal Company*, supra.

(3) ACTS OF OFFICERS

Reports of engineering officers, communications of International Waterways Commission, action of the Attorney General, establishment of plans by engineers, etc., can not foreclose sovereign rights in respect to which the officers have no power to act for the United States (in granting privileges). See excerpt from the Wheeling Bridge Case (supra, p. 267).

In *Pine River Logging Co.* v. *United States*, 186 U. S. 279, 291, this court said:

> No authority had been given them to extend the contracts either as to the quantity or quality of timber to be cut. * * * They, as well as the parties thereto, were equally bound by its provisions. * * * No conduct of theirs can estop the Government from asserting its rights to recover for timber cut beyond the quantity and quality specified in the contract. [Citing cases.] We are there-

fore of opinion that the defendants can not take refuge under the consent or acquiescence of the Government agent in the disregard of these contracts.

In *Whiteside et al.* v. *United States*, 93 U. S. 247, 257, this court said:

> The rule as to the effect of the like act of a public agent is otherwise, for the reason that it is better that an individual should occasionally suffer from the mistakes of public officers or agents, than to adopt a rule which, through improper combinations or collusion, might be turned to the detriment and injury of the public * * * And it is clear that if the cotton was abandoned or captured property, within the meaning of the act of Congress, under which it was collected, transported, and stored, the acts of the officer were unauthorized and unlawful.

In this case it was held that a release of the cotton by officers was not binding on the United States.

In *Morris* v. *United States*, 174 U. S. 196, 288, this court said:

> It was the opinion of the court below that under the legislation * * * jurisdiction with respect to private wharves had been conferred upon the authorities of the city, and that hence the Chief Engineer is without any lawful authority to issue such licenses. * * * We see no reason to doubt the soundness of this conclusion, though for the reasons already given, even if the power to grant such licenses had belonged to the Chief of Engineers, they would not have vested any rights in fee, etc.

The appellant not only knew that the Secretary was claiming jurisdiction as the agent of Congress, but at least until 1907, conceded the Secretary's jurisdiction.

In *Williams* v. *Wadsworth*, 51 Conn. 277, 310, the court said:

> The defendant having knowledge that the plaintiff disputed his right to divert the water in the manner contemplated and would endeavor to prevent it by legal proceedings, notified him that he intended to take the water to his dwelling house, and requested him to institute legal proceedings by way of prevention before expense should be incurred. The plaintiff disregarded the request, and the defendant insists that he should not now be heard by way of objection. * * * Thenceforth the defendant assumed the risk attendant upon his action.

The foregoing completely answers any suggestion that the recital in the petition of November 28, 1906, of a desire to have the Government consent before incurring expense as to the Little Calumet, could limit the rights of the Government or enlarge those of the district.

In *State, etc.*, v. *Brewer*, 64 Ala. 298, the court said:

> Estoppels against the State can not be favored. They may arise from its express grants; but can not arise from the laches of its officers. * * * It was not within the *scope* of the *powers of the auditor* to allow the credit, etc.

In note to *State of Michigan* v. *Jackson, etc., Co.* C. C. A. 345, 354, it was said:

> But, on the other hand, the State can not be bound, either on the ground of estoppel, acquiescence, or implied ratification, by any acts of its officers which are byond the scope of their authority, or which are illegal, fraudulent, or negligent, or by defaults or omissions of such officers possessing the same characteristics. [Citing cases, among others *Hunter* v. *United States*, 5 Pet. 173 and *People* v. *Brown*, 67 Ill. 435.]

See also *Floyd Acceptances*, 7 Wall. 666; *Lee* v. *Munroe*, 7 Cranch 366, 3 L. ed. 373; *State* v. *Chilton*, 49 W. Va. 453; *Pulaski* v. *State*, 42 Ark. 118.

In *City of Mobile* v. *Sullivan Timber Co.*, 129 Fed. 302–3, the court said:

> Surely it will take something more than proof of the quiescence of a commission like that [Mobile River Commission] to estop the municipality which holds the title for the public benefit from proceeding with its duty to protect the public interest. Estoppels are not favored by the law, and this would seem especially true when by such estoppel it is attempted, by the omission or indifference of officials, to finally conclude the rights of the public to a public use.

The court quotes from *Mayor of Jersey City* v. *American Dock, etc., Co.*, 23 Atl. 682, 684, as follows:

> The title is vested in the city in trust for the public, and is therefore inalienable and

indeposable, except by legislative action. The composition of the so-called title of the defendant, it will be observed, consists of the acquiescence and neglect of the trustee of a public use and the deed of a board having no power over the subject. Such a claim seems to me singularly futile.

(4) CONGRESSIONAL APPROPRIATION TO INVESTIGATE IMPROVEMENT OF NAVIGATION IN ILLINOIS AND DES PLAINES RIVERS CAN NOT CONSTITUTE ESTOPPEL

No doubt Congress, ever since the Act of 1822 (providing for Illinois and Michigan Canal), has steadily had in mind connecting the Lakes with the Mississippi River for purposes of navigation. It would have eagerly invited the construction not of one but of many connecting channels, all with an eye single to interior navigation, and it often has investigated many suggested projects; but an appropriation to investigate methods of improving navigability of the Illinois and Des Plaines Rivers can not be warped into a permit to convert the Calumet River into a sewer, or a permit to withdraw 10,000 cubic second-feet of water from Lake Michigan. Nor, indeed, could an appropriation directly to investigate the propriety of suffering such a withdrawal be twisted into a permit so to do. One may send an agent to investigate the proposed purchase of a cattle ranch, but it will not constitute an agreement on his part to purchase, nor authorize the owner to urge estoppel by reason of assumption that he would purchase.

One may incur expense in determining whether he ought to consent to a railroad right of way across his farm, but this does not estop him from disputing the railroad's right to cross.

In the pleading, and throughout this case, the appellant has subtly sought to obscure the plain distinction between navigation and sewage. The latter demands many times the volume of flow needed for the former. Furnishing the flow necessary for the former would not at all injure navigation, but furnishing the added flow now said to be needed for sewage, does. The appellant, and before its creation, the city of Chicago, began by arrangement with the State as early as 1858, to try to connect itself with navigation channels, and particularly the Illinois and Michigan Canal; and in the several petitions to the Secretary of War it kept prominently to the front the suggestion the *benefit of navigation*, and sedulously screened the underlying motive of sewage. The Government properly consented to straightening and enlarging the Chicago River channel, always with the condition of a withdrawal limit which finally became 4,167 cubic second-feet; and not until 1912 did the appellant make application for any more. It did most of its work on the representation that that amount would meet their needs. And if the project would admit of no larger withdrawal, and it were not threatening to withdraw more, this suit would not be pending. Until the threat to injure the public right of navigation there

was no occasion to appeal to the courts, just as until the sewage deposits threatened became objectionable to the State of Missouri, there was no occasion for it to appeal to the courts. (*Missouri* v. *Sanitary District*, 180 U. S. 208, 243–5–6–7.)

(5) COOPERATION IN IMPROVEMENT OF CHICAGO RIVER

This was for the sole purpose of bettering navigation. All that has been said under the heading last above applies here. The Government would have no objection to-day to widening or deepening of channels so long as the lake withdrawals were limited to the maximum of its permit. And the appellant induced the Government's belief that it would not require more than the permitted amount.

(6) SUFFERING OTHERS, INCLUDING CANADA, TO LOWER, AND LOWERING BY ITS OWN WORKS, CANNOT CONSTITUTE ESTOPPEL

The Government was entirely within its rights had this been done, for the whole subject is in the exclusive control of Congress and no outsider can complain of its permits or undertake to regulate or apportion them for Congress. The City of Milwaukee could not urge the 4,167 cubic second-feet authorized at Chicago as a justification for diverting whatever added amount it desired from the lake without a permit.

Per contra: The appellant can not urge other diversions, whether permitted or merely suffered, as a justification for its diverting without a permit.

Indeed, it was to avoid just such controversy that Congress required *national assent* to *any diversion whatever*.

(7) GOVERNMENT WORK OF DEEPENING CHANNELS OF GREAT LAKES CAN NOT CONSTITUTE ESTOPPEL

It is said this will overcome the effect of the appellant's proposed withdrawal of water. History shows a steady artificial deepening of the harbors and channels of the lakes and connecting rivers by the Government at enormous cost. Confessedly the appellant's acts will somewhat shoal them. Some boat that could have just passed over a bar before would be caught now. The tendency is to diminish and to interfere with navigable capacity. It will not do to say that the shoaling will be less than the Government has allowed for, or that compensating works proposed in order to raise the water a foot on Lake Erie would more than cover the lowering caused by the district. The Government, if it planned compensating works, did so to get deeper water because deeper water was demanded—not to hold the water constant against the unlawful diversion of the appellant or of others similarly situated. If it used a lower plane, it did so for precautionary purposes. "No person can found a right on his own wrong," nor on the effort by another to guard against the consequences of that wrong. If appellant could urge these features, so could every other city or person diverting. Every foot of deepening accomplished by the Government would be made an excuse

for lowering by others of a like amount, until the Government's increase of depth would spell disaster instead of benefit to navigation. This principle applied to the very great deepening accomplished in the past would have to-day resulted in leaving the lakes with a net depth for navigation purposes no greater than when Federal improvement of lake waters began.

IX

Appellee is entitled to an injunction, effective immediately, restraining appellant from diverting more than 4,167 c. s. f.

Appellant makes five contentions which for convenience we are treating under one heading:

A. That the Attorney General has no authority to institute suit for an injunction restraining the maintenance of an obstruction. (Appellant's Point III (b).)

B. That the doctrine of comparative injury applies and therefore a court of equity should deny relief. (Appellant's Point VII.)

C. That appellant's motion of July 12, 1920, should have been allowed, and a modified injunction allowed conditional on the construction and maintenance of compensating works in the Great Lakes. (Appellant's Point IX (a).)

D. That the operation of the injunction should be suspended for a period of years. (Appellant's Point IX (b).)

E. That the decree of injunction should provide that it should be subject to any further action that

the Secretary of War might take. (Appellant's Point IX (c).)

These will be discussed in the same order as above noted.

A

The Attorney General has authority to institute suit for an injunction in aid of the performance of the Government's duty to preserve the navigability of navigable waters of the United States

Under its Point III, subheading (b), appellant contends that the Attorney General, under the Act of March 3, 1899, is only authorized to institute suits in equity for the *removal* of *structures*, and that the District Court was without jurisdiction to entertain this suit or enter the decree. A search of the record discloses that nowhere either in the pleadings or by motion or in the evidence or during the hearing was the jurisdiction of the District Court as a court of equity questioned and that both parties treated the case as a proper case for equity jurisdiction. Judge Carpenter stated, in his opinion (Rec. Vol. VIII, p. 129) "The jurisdiction of the court has not and could not be challenged." *Proceedings for bill for injunction rather than by indictment were at the request of the appellant itself.* (See Statement of the case, p. 66). Inasmuch, however, as the point is made, we make reply to it.

A portion of the Calumet permit of June 30, 1910, may appropriately be quoted here:

> That this permission shall in nowise affect or in any manner be used in the friendly suit now pending in the Circuit Court of the United States for the Northern District of Illinois

> brought by the United States of America against the Sanitary District of Chicago, to determine the right of the said Sanitary District to divert from Lake Michigan for sanitary purposes an amount of water in excess of that now being diverted, without having first obtained a permit from the Secretary of War. (Rec. Vol. VII, p. 28.)

The appellant therefore has been perfectly content to have its right determined by a court of equity on a bill for an injunction, both in the Calumet River suit and in the Main Channel suit.

(1) SECTION 12 OF THE ACT OF MARCH 3, 1899 IS SUFFICIENT AUTHORITY FOR THE INSTANT SUIT

Section 12 of the Act of March 3, 1899 provides that—

> the removal of any structures or parts of structures erected in violation if the provisions of the said sections may be enforced by the injunction of any circuit court exercising jurisdiction in any district in which such structures may exist and proper proceedings to this end may be instituted under the direction of the Attorney General of the United States.

Appellant contends that because of this provision the Attorney General can sue only to *remove* structures or parts of structures erected in violation of Section 10, and that in the present case he is not suing to *remove* any *structures*. A sufficient answer to this contention would seem to be the recent decision of this Court in *Economy Light & Power Co.*,

256 U. S. 113. In that case the defendant had commenced the construction of a dam across the Des Plaines River in Illinois. The decree not only ordered the removal of the portion already constructed but perpetually enjoined the defendant from placing any further obstruction in the river and from doing any other act or performing any other work in connection with the construction of the dam. (See *Economy Light & Power Co.* v. *United States*, C. C. A., 7th Circuit, 256 Fed. 792, 793.) The decree was affirmed in the Circuit Court of Appeals for the Seventh Circuit and by this Court in *Economy Light & Power Co.* v. *United States*, 256 U. S. 113. It is apparent from the opinion of this Court that the suit was regarded merely as one to enjoin the construction of a *proposed* dam; for example, it is stated (p. 115):

> This was a suit brought by the United States against appellant in the district court for the northern district of Illinois, eastern division, for an injunction to restrain defendant from constructing a dam in the Des Plaines river at a point in Grundy county, Illinois, without the consent of Congress or authority of the legislature of the state, and without approval of the location and plans by the Chief of Engineers and the Secretary of War of the United States. Relief was prayed upon two grounds: (1) That the river bed where the dam was being constructed was the property of the United States; (2) that the Des Plaines river was a navigable waterway of the United States, and the *proposed* construction of a dam therein

was in violation of the Act of Congress of March 3, 1899 (chap. 425, § 9, 30 Stat. at L. 1121, 1151; Comp. Stat., § 9971, 9 Fed. Stat. Anno.; 2d ed., p. 81).

Throughout the opinion the obstruction is referred to as the "proposed dam."

If appellant's construction of Section 12 be correct, then the United States is powerless to prevent an obstruction to the navigable capacity of its navigable waters until the obstruction is at least partially accomplished. The Attorney General can sue only to *remove* structures or parts of structures, erected in violation of the Act of 1899. But such a construction leads to absurd results that could never have been intended by Congress. The very first act in building a dam or a bridge may be the throwing of a cable or a girder across a stream. Once even this much is accomplished, the most injurious results may be effected by the blocking of the stream to all navigation and yet the injured parties must await, according to appellant, until a court has ordered the *removal* of the cable or girder; they may not, knowing the plans of a defendant to do such an act, *restrain* its accomplishment before the harm is done. Suppose that a defendant, intending to throw a bridge across a river, first builds the approaches and supports on land belonging to him on both sides of the river. These structures in themselves are not in violation of any law. Must the United States wait until he throws a cable across? Or a person may be planning to sink a vessel in a stream for the purpose of blocking

traffic or for some purpose of his own. Must everyone, including the United States, wait until this is accomplished and the arduous task of removing the wreck is ordered by a court?

But, says appellant, we concede that an injunction may issue in such a case, but it must be against a *structure*, and a diversion is not a structure. Having conceded that the word *remove* must receive a liberal interpretation in the light of the undoubted intent of Congress, appellant must, we believe, concede that the word *structure* should receive a similarly liberal interpretation. There are several considerations, however, which lend confirmation to this:

(1) The word *structure* was intended to be at least coordinate with the *obstructions* covered by the preceding sections 9, 10, and 11. The cognate derivation of the two words indicates that much. It is usually some sort of *structure* which causes the *obstruction*. For example, in *United States* v. *Rio Grande Dam & Irrigation Co.*, 174 U. S. 690, the *obstruction* was a lowering of the level of the navigable portion of the Rio Grande River, by reason of a diversion of water in its nonnavigable portion; the offending *structure* was a dam in the nonnavigable portion. In the instant case, the *obstruction* is the lowering of the level of the Great Lakes, by reason of a diversion of water in the West Fork of the South Branch of the Chicago River; the offending *structure* is the works of appellant which divert, under the operation of appell-

ant's agents, an unauthorized amount of water. In either case, the purpose of the statute is to remove the obstruction by removing its cause. The word *structure* means anything which causes an *obstruction*.

(2) Congress intended by the Act of March 3, 1899, to *extend*, not to *limit*, the scope of Federal control over obstructions and modifications of the navigable capacity of navigable waters. This is clear from other provisions in the Act, as well as the considerations which led to its enactment.

(3) An act such as the Act of March 3, 1899, must be liberally construed in favor of the paramount right of which it purports to be an exercise. "The language * * * must be given full scope." (*United States* v. *Rio Grande Dam & Irrigation Co.*, *supra*.)

(4) Congress could never have intended to leave to the hazard of a jury a question such as is presented in the instant case. The delay incident to criminal proceedings would make it fatal to the object sought to be accomplished, i. e., the preservation of the navigable capacity of navigable waters of the United States. A judgment on an indictment would not remove the obstruction. Finally, it would be impossible to persuade a jury to convict in a community receiving the benefits of the appellant's unlawful acts.

(5) In the Act of 1890, Section 10 provided that injunction proceedings might be instituted to enjoin *obstructions*. Section 12 of the Act of 1899 was

intended to have a broader scope and to cover *all* structures in violation of Sections 9, 10, and 11, whether the structures amounted to, or caused, obstructions, or were merely unlawful modifications of the condition of a navigable water, not amounting to obstructions.

In *Virginia* v. *Tennessee*, 148 U. S. 519, this Court said:

> And the meaning of a term may be enlarged or restrained by reference to the *object* of the whole clause in which it is used.

See also *United States* v. *Freeman*, 3 How. 565 and *Jones* v. *Guaranty Co.*, 101 U. S. 626.

We submit that the maxim "*noscitur a sociis*" is aptly applied in interpreting the word "*structure*". The associated words are to be found in what is prohibited in Sections 9, 10, and 11. (*Virginia* v. *Tennessee*, supra, p. 519.)

(2) INDEPENDENTLY OF SECTION 12, THERE IS SUFFICIENT AUTHORITY FOR THE INSTANT SUIT

Let us assume that Section 12 of the Act of 1899 does not apply to the present case. Appellant contends that if this is so there is an implied *denial* of authority from Congress for the institution of the instant suit. The basis for this contention rests chiefly on the provision contained in Section 10 of the Act of 1890 authorizing the removal of obstructions by suit for injunction. This, according to appellant, has been repealed and is an indication that no such

authority was longer to be given the Attorney-General of the United States.

It is by no means certain that this portion of a Section 10 of the Act of 1890 was repealed. Section 20 of the Act of 1899 (30 Stat. 1155) provided in part

> that all laws or parts of laws inconsistent with the foregoing Sections 10 to 20, inclusive, of this Act are hereby repealed.

Whether the injunction clause in Section 10 of the Act of 1890 was thus repealed depends upon whether it is inconsistent with any portion of the later Act, and this has never been decided.

Assuming, however, that all of Section 10 of the Act of 1890 was repealed, this could not have been intended to operate as a denial of the right to sue for an injunction in such cases as the present, for the following reasons:

(1) In 1895 this Court rendered its decision in Re Debs, 158 U. S. 564, and upheld for the first time the broad power of the United States to protect interstate commerce from interference without either a showing of pecuniary interest or specific statutory authority from Congress. The question had been one of extreme doubt before that time. Congress must be assumed to have known of that decision and to have regarded it unnecessary thereafter to insert specific statutory authority for injunction suits in such matters, and to have taken it for granted that the United States had such power anyway.

(2) The reason for the insertion of the clause in Section 12 of the Act of 1899, providing for the

removal of structures must then be taken to insure that the United States could *remove* the structures as well as prevent their construction, a power not always incident to suits for injunctions and resembling rather the *abatement* of a nuisance.

(3) Another reason for the insertion of the clause in Section 12 of the Act of 1899 may well be that not all structures erected in violation of Sections 9, 10, and 11 of that Act amounted to *obstructions*, and Congress wanted to insure power to remove them also.

(4) The considerations numbered (2), (3), and (4) above mentioned in the preceding heading with regard to the interpretation of the word *structure* are also persuasive that Congress did not, by Section 12, intend to deny to the United States rights which it had independently of statute.

In the *Wheeling Bridge case*, 13 How. 518, this Court decreed an injunction in favor of the State of Pennsylvania, enjoining the maintenance of an obstruction, although there was no statutory authority for an injunction in such cases. It was held that a *prima facie* case for the exercise of equity jurisdiction had been made out and—

> Such a proceeding is as common and as free from difficulty as an ordinary injunction bill.

In that case, however, the State of Pennsylvania alleged and, it was held, had sufficiently shown a property interest to be protected. That the United States need have neither a property interest nor statutory authority to protect interstate commerce

from interference was made clear In re Debs, 158 U. S. 564. We quote at length from the opinion (pp. 581–591):

> If all the inhabitants of a state, or even a great body of them, should combine to obstruct interstate commerce or the transportation of the mails, prosecutions for such offenses had in such a community would be doomed in advance to failure. And if the certainty of such failure was known, and the national government had no other way to enforce the freedom of interstate commerce and the transportation of the mails than by prosecution and punishment for interference therewith, the whole interests of the nation in these respects would be at the absolute mercy of a portion of the inhabitants of that single state.
>
> But there is no such impotency in the national government. *The entire strength of the nation may be used to enforce in any part of the land the full and free exercise of all national powers and the security of all rights entrusted by the Constitution to its care.* The strong arm of the national government may be put forth to brush away all obstructions to the freedom of interstate commerce or the transportation of the mails. If the emergency arises, the army of the nation, and all its militia, are at the service of the nation to compel obedience to its laws.
>
> But passing to the second question, is there no other alternative than the use of force on the part of the executive authorities whenever obstructions arise to the freedom of interstate commerce or the transportation of the mails?

Is the army the only instrument by which rights of the public can be enforced and the peace of the nation preserved? Grant that any public nuisance may be forcibly abated either at the instance of the authorities, or by any individual suffering private damage therefrom, the existence of this right of forcible abatement is not inconsistent with nor does it destroy the right of appeal in an orderly way to the courts for a judicial determination and an exercise of their powers by writ of injunction and otherwise to accomplish the same result. * * *

So, in the case before us, the right to use force does not exclude the right of appeal to the courts for a judicial determination and for the exercise of all their powers of prevention. *Indeed, it is more to the praise than to the blame of the government that,* instead of determining for itself questions of right and wrong on the part of these petitioners and their associates and enforcing that determination by the club of the policeman and the bayonet of the soldier, *it submitted all those questions to the peaceful determination of judicial tribunals,* and invoked their consideration and judgment as to the measure of its rights and powers and the correlative obligations of those against whom it made complaint. And it is equally to the credit of the latter that the judgment of those tribunals was by the great body of them respected and the troubles which threatened so much disaster terminated.

* * * * * *

> *Every government, entrusted by the very terms of its being with powers and duties to be exercised and discharged for the general welfare, has a right to apply to its own courts for any proper assistance in the exercise of the one and the discharge of the other*, and it is no sufficient answer to its appeal to one of those courts that it has no pecuniary interest in the matter. The obligations which it is under to promote the interest of all and to prevent the wrong-doing of one resulting in injury to the general welfare is often of itself sufficient to give it a standing in court. This proposition in some of its relations has heretofore received the sanction of this court.

The Court then calls attention to the holdings in *United States* v. *San Jacinto Tin Co.*, 125 U. S. 273, 31 L. ed. 747, and *U. S.* v. *American Bell Teleph. Co.*, 128 U. S. 315, 32 L. ed. 450, and continues:

> It is obvious from these decisions that while it is not the province of the government to interfere in any mere matter of private controversy between individuals, or to use its great powers to enforce the rights of one against another, yet, whenever the wrongs complained of are such as affect the public at large, and are in respect of matters which by the Constitution are entrusted to the care of the nation, and concerning which the nation owes the duty to all the citizens of securing to them their common rights, then the mere fact that the government has no pecuniary interest in the controversy is not sufficient to exclude it from the courts, or prevent it from taking

measures therein to fully discharge those constitutional duties.

The national government, given by the Constitution power to regulate interstate commerce, has by express statute assumed jurisdiction over such commerce when carried upon railroads. It is charged, therefore, with the duty of keeping those highways of interstate commerce free from obstruction, for *it has always been recognized as one of the powers and duties of a government to remove obstructions from the highways under its control.*

* * * * *

Indeed, the obstruction of a highway is a public nuisance (4 Blackstone, 167) and a public nuisance has always been held subject to abatement at the instance of the government. *Atty. Gen.* v. *Tudor Ice Co.* 104 Mass. 239, 244; 6 Am. Rep. 227; *Atty. Gen.* v. *Jamaica Pond Aqueduct Corp.* 133 Mass. 361; *Pine City* v. *Munch*, 42 Minn. 342, 6 L. R. A. 763; *State* v. *Goodnight*, 70 Tex. 682.

After discussion and approval of other cases, including *Gilman* v. *Philadelphia*, 70 U. S. 713, 18 L. ed. 96 and the *Wheeling Bridge case*, 13 How. 518, this Court said:

It is said that seldom have the courts assumed jurisdiction to restrain by injunction in suits brought by the government, either state or national, obstructions to highways, either artificial or natural. This is undoubtedly true, but the reason is that the necessity for such interference has only been occasional.

The Debs case has been quoted with approval in connection with questions pertinent to the present case in *Louisiana* v. *Texas*, 176 U. S. 1, 19; *United States* v. *Trans-Missouri Freight Association*, 166 U. S. 290, 343; *Missouri* v. *Illinois*, 180 U. S. 208, 236; *Northern Securities Company* v. *United States*, 193 U. S. 197, 356.

B

The doctrine of comparative injury has no application to a suit by the United States to protect its sovereign power over interstate commerce

In *Ruppert* v. *Caffey*, 251 U. S. 264, this Court said (p. 301):

> While this is a government of enumerated powers, it has full attributes of sovereignty within the limits of those powers.

As was stated in *Re Debs*, 158 U. S. 564, 582:

> The entire strength of the nation may be used to enforce in any part of the land the full and free exercise of all national powers and the security of all rights intrusted by the Constitution to its care. The strong arm of the national government may be put forth to brush away all obstructions to the freedom of interstate commerce or the transportation of the mails. If the emergency arises, the army of the nation, and all its militia, are at the service of the nation to compel obedience to its laws.

Must the United States, because it chose rather to submit this case "to the peaceful determination of judicial tribunals" have its sovereign rights made a delusion by a "comparison of equities?"

> There is no room in our scheme of government for the assertion of state power in hostility to the authorized exercise of Federal power. (*Minnesota Rate Cases*, 230 U. S. 352, 399.)

There *would* be such room if allowance were made for a "comparison of equities" when the United States has not only asserted its paramount control but has proved an interference with that control by a state agency such as appellant. See the exhaustive note with respect to the doctrine of comparative injury in enjoining nuisances in 31 L. R. A. (N. S.) 881.

There *can* be no equities in a case such as this. Either the United States has proved a violation of Section 10 of the Act of March 3, 1899 or it has not. If it has, there is an unlawful assertion of State power in hostility to the sovereign power of the Nation, and no excuse or justification can be recognized. The hostility must cease, and it is the State which must withdraw from the controversy.

What *are* the equities that appellant desires that this Court consider?

(1) Is it the fact that the appellant, at the end of 1892 or the early part of 1893, commenced to excavate in the State of Illinois? It did so in the face of the Act of Congress of 1890 and of the suggestions on every hand that Federal cooperation would be necessary.

(2) Or the fact that appellant continued to spend money after 1896? It did so in the face of an express

warning from the Board of Engineers in 1895 and a notice from the Secretary of War in 1896 that no authority was yet given it to divert water from the Chicago River.

(3) Or the fact that it continued to spend money after 1899? This was in the face of warnings too numerous to mention, in the reports of the Engineer in Charge at Chicago and in the conditions of the permits and in the provisions of the Act of 1899, which were constantly brought to its attention?

(4) Or the fact that it continued to spend money after the Calumet River Suit was instituted? or the Main Channel Suit?

Thus we might go on, but it is unnecessary. Yes, the appellant has expended over $75,000,000 of the money of taxpayers, not in reliance upon, or because of putting faith in any misleading assertion or act of appellee's officers or agents, but on a *gamble* that the United States would not put an end to it. The effect of the execution of its projects upon the navigable waters of the United States was put up to it squarely at every stage of its negotiations with the Government. The appellant seemed to ignore that its canal was in the United States, and subject, always, to Federal control.

The *equities* that appellant now asserts are nothing more than the results of *defiance* of unquestionable Federal authority. Were the advantages of unlawful acts ever deemed to create *equities* in the law breaker?

And have equities *ever* been asserted against a sovereign right? The principle for which appellant contends is the same principle to which this Court, in *Union Bridge Co.* v. *United States*, 204 U. S. 401, referred as one which "would seriously impair the exercise of the beneficent power of the government to secure the free and unobstructed navigation of the waterways of the United States." (See *supra*, p. 267.)

Appellant asserts that the injury to appellee is comparatively slight and may be easily compensated. That is for the appellee, not appellant, to judge, and Congress and the Secretary of War have passed upon the question. Their determination is conclusive The same contentions were made in the *Wheeling Bridge Case*, 13 How. 518, 568:

> But, it is said, the bridge constitutes no serious obstruction to the navigation of the Ohio; that only seven steamboats, of two hundred and thirty which ply upon the river as high as Pittsburg, are obstructed; and that arises from the height of their chimneys, which might be lowered at a small expense, in passing under the bridge; that, by the introduction of blowers, the chimneys might be shortened without lessening the speed of the boats; that the goods and passengers which are conveyed on the public lines of communication, between Pittsburg and Philadelphia, could be as well conveyed on boats of lower chimneys, and consequently the State, as proprietor of those lines, if at all injured,

> is injured so inconsiderably as not to lay the foundation of this procedure; that none of the packets or the other boats on the river are owned by the State of Pennsylvania.

This Court said further (p. 578):

> The Bridge Company had legal notice of the institution of the suit, and of the application for an injunction to stay their proceedings, before their cables were thrown across the river. This should have induced them to suspend, for a time, their great work, alike creditable to the enterprise of their citizens, and the genius and science of the engineer who planned the bridge and superintended its construction. It is a matter of regret that, by the prosecution and completion of the bridge, they have incurred a high responsibility.

See also *Miller* v. *Mayor of New York*, 109 U. S. 385.

Under the pleadings in this case, the appellee offered no evidence to meet that introduced by appellant in support of its affirmative defenses, as there was a motion to strike pending. We do not, of course, concede the correctness of any of appellant's exaggerated figures either as to the amount of diversion really necessary to take care of all practical danger from a maximum run-off in the Chicago River or as to the cost of installing purification works such as other cities on the Great Lakes and elsewhere have done. We merely state, that conceding them to be true, they are immaterial and constitute no defense. We have

noted, however, that in spite of the supposed fatal effects of the run-off of 10,000 c. s. f. in the Chicago River, the appellant was able to manage with a great deal less from 1900 to after 1913 and even now claims to ask only 8,000 c. s. f. so far as the Chicago River is concerned (the other 2,000 c. s. f. to be diverted through the Calumet River). Of this 8,000 c. s. f. a large part, probably over 1,000 c. s. f., is from drinking water, etc. The maximum run-off of the Calumet River is 15,700 c. s. f. and yet appellant has never planned on more than 4,000 c. s. f. diversion through that river.

The power of appellant to raise money by taxation or otherwise is a matter for the State of Illinois. The appellant assumes to justify its acts under State authority: presumably it can obtain the necessary authority to raise money.

The equities involved in this case, using the word in a broad and not a legal sense, are not with the appellant.

In asking this Court to balance "equities," appellant is in effect asking it to disregard the decision of Congress and the Secretary of War, and to grant appellant a *permit* to continue its defiance of Federal authority. If there *are* equities, the proper forum in which to present them is Congress.

C

The lower court did not err in denying appellant's motion of July 12, 1920

The appellee sought by suit instituted in the proper forum to restrain appellant from diverting more than

4,167 c. s. f., the limitation placed upon it by the Secretary of War. By its motion of July 12, 1920, appellant in effect asked permission from the *court* to divert not exceeding 10,000 c. s. f. on the strength of an offer which it then made to pay the expense of constructing such regulating and compensating works as the United States might determine to build to offset for the lowering of the lake levels and connecting channels, due to a diversion of 10,000 c. s. f. The works were to be built in such places as the St. Clair and Niagara Rivers. We need not dwell on the feasibility or probable expense of such works (as to which questions there was extreme difference of opinion—see Statement of the Case, p. 107), or whether the appellant can ever constitutionally spend money of Illinois taxpayers on submerged weirs on the international boundary. The fundamental legal obstacles to any such decree are sufficient without consideration of questions of fact.

(1) APPELLANT MAY NOT BE UPHELD IN ITS UNLAWFUL DIVERSION BY ITS OFFER TO GIVE APPELLEE SOMETHING ELSE OF ALLEGED EQUAL VALUE

In *Kansas* v. *Colorado*, 206 U. S. 46, this Court said p. 100:

> Colorado could not be upheld in appropriating the entire flow of the Arkansas river, on the ground that it is willing to give, and does give, to Kansas something else which may be considered of equal value. That would be equivalent to this court's making a contract between the two states, and that it is not authorized to do.

This principle applies with even greater force to a suit by the United States to enforce a sovereign right.

(2) THE POWER OF GRANTING OR REFUSING AUTHORIZATION LIES IN CONGRESS, AND, SO FAR AS IT HAS BEEN DELEGATED, IN THE CHIEF OF ENGINEERS AND THE SECRETARY OF WAR

In the case of *Wilson* v. *Shaw*, 204 U. S. 2432, this court said:

> We have no supervising control over the political branch of the Government in its action within the limits of the Constitution. *Jones* v. *United States*, 137 U. S. 202, and cases cited in the opinion; *Re Cooper*, 143 U. S. 472, 499, 503.

(3) UNDER THE TERMS OF THE CANADIAN BOUNDARY WATERS TREATY OF JANUARY 11, 1909, THE CONSTRUCTION OF SUCH WORKS AS THE APPELLANT PROPOSES CAN NOT BE UNDERTAKEN WITHOUT THE APPROVAL OF THE INTERNATIONAL JOINT COMMISSION

Article 4 of the Treaty reads as follows:

> The High Contracting Parties agree that, except in cases provided for by special agreement between them, they will not permit the construction or maintenance on their respective sides of the boundary of any remedial or protective works or any dams or other obstructions in waters flowing from boundary waters or in waters at a lower level than the boundary in rivers flowing across the boundary, the effect of which is to raise the natural level of waters on the other side of the boundary

unless the construction or maintenance thereof is approved by the aforesaid International Joint Commission.

Article 8 of the Treaty provides:

> This International Joint Commission shall have jurisdiction over and shall pass upon all cases involving the use or obstruction or diversion of the waters with respect to which under Articles 3 and 4 of this Treaty the approval of this Commission is required.
>
> * * * * *
>
> The Commission in its discretion may make its approval in any case conditional upon the construction of remedial or protective works to compensate so far as possible for the particular use or diversion proposed, and in such cases may require that suitable and adequate provision, approved by the Commission, be made for the protection and indemnity against injury of any interests on either side of the boundary.
>
> In cases involving the elevation of the natural level of waters on either side of the line as a result of the construction or maintenance on the other side of remedial or protective works or dams or other obstructions in boundary waters or in waters flowing therefrom or in waters below the boundary in rivers flowing across the boundary, the Commission shall require, as a condition of its approval thereof, that suitable and adequate provision, approved by it, be made for the protection and indemnity of all interests on the other side of the line which may be injured thereby.

> The majority of the Commissioners shall have power to render a decision. In case the Commission is evenly divided upon any question or matter presented to it for decision, separate reports shall be made by the Commissioners on each side to their own Government. The High Contracting Parties shall thereupon endeavor to agree upon an adjustment of the question or matter of difference, and if an agreement is reached between them, it shall be reduced to writing in the form of a Protocol, and shall be communicated to the Commissioners, who shall take such further proceedings as may be necessary to carry out such agreement. (Rec., Vol. IV, pp. 2564–2567.)

If this Court were, to permit by its decree a diversion of 10,000 c. s. f. it would be invading not only the field of political questions committed to Congress, but also the field of international questions committed to an international tribunal.

(4) THE DECREE WHICH APPELLANT PROPOSES WOULD BE VOID AND INOPERATIVE, IN THAT IT WOULD CONTAIN A CONDITION WHICH THE COURT WOULD BE POWERLESS TO ENFORCE

The construction of submerged weirs in the Niagara and St. Clair Rivers may never be authorized by Congress. Even if authorized by Congress they may never be permitted by the International Joint Commission. If they *are* authorized, they may cost many times what the appellant has in mind or is able to pay. The appellant will feel free to say that the works are not such as it had in mind when it made

the offer. There will be no way of determining the meaning of such a decree or the proper manner of enforcing it. In the meantime appellant will be diverting 10,000 c. s. f. and, to judge by its past performances, considerably more.

In *Kansas City S. R. Co.* v. *Kaw Valley Drainage District*, 233 U. S. 75, it was recognized that such a decree could not be entered. We quote from the opinion as follows (pp. 77-78):

> The supreme court [of Kansas] recognized that it could not order the bridges to be raised to the required height without the authority of the Secretary of War.
>
> * * * * *
>
> But the court went on, on the assumption that it would lead to the elevation of the bridges, and seemingly for the purpose of accomplishing indirectly what it admitted that it could not do directly, to make an unqualified absolute order, as we have said, that the defendants should clear the channel of all obstructions on their lines up to the specified heights—in other words, to remove the bridges as they stand.
>
> These judgments must be taken as they read upon their face. They are not conditional orders to raise the bridge if the defendants can obtain the consent of parties not before the court, and of one authority at least not subject to its control. They can not be qualified by speculation as to what is likely to happen in fact. They are out-and-out orders to remove bridges that are

> a necessary part of lines of commerce by rail among the states. But that subject matter is under the exclusive control of Congress and is not one that it has left to the states until there shall be further action on its part.

In Corpus Juris, Vol. 21, p. 658, we find the following:

> A decree should ascertain and fix with definiteness and certainty the rights and liabilities of the respective parties to the cause. If it is uncertain and indefinite in these particulars it is at least erroneous and may be void.

and on pp. 645–6, the following:

> A final decree whose validity and force depend upon the performance of some condition by one of the parties is void.

See also 14 Ruling Case Law, 321; 25 L. R. A. (N. S.) 271, note; *American School Furniture Co.* v. *Sauder Co.*, 106 Fed. 781; *Hawley* v. *State Bank*, 134 Ill. App. 96; *Bank of Commerce* v. *Goolsby*, 129 Ark. 416, 196 S. W. 803; *Simmons* v. *Jones*, 118 N. Car. 472, 24 S. E. 114; *Pennsylvania Co.* v. *Bond*, 99 Ill. App. 535 (affirmed in 202 Ill. 95, 66 N. E. 941).

In the case of *Pennsylvania Co.* v. *Bond*, *supra*, the Appellate Court said, on p. 542:

> This portion of the decree is doubtless open to objection. By its terms it becomes effective only if it shall appear that these things have been done. How it is to be determined whether they have been done, the decree does not state. Why counsel should have submitted to the chancellor a decree containing

such a condition, especially when the evidence showed that the condition had been already fulfilled, we are at a loss to discover. This part of the decree is by its terms inoperative.

In the case of *Bank of Commerce* v. *Goolsby*, 129 Ark. 416, 446 the Supreme Court of Arkansas said:

> The decree in favor of J. H. Frost, E. B. Russum, A. N. Cole, R. O. Herbert, Alta Blaylock, J. O. Gunter, C. L. Pyle, W. H. Cole, R. T. Powell, Lawrence Wright, R. P. Reynolds, E. D. Vann, and J. O. Johnson, against the directors were upon the contingency or condition that each of these parties should pay the decrees rendered against them respectively in favor of the bank. These decrees were not only anomalous, but they were without authority of law and void.
>
> That a judgment *in praesenti* can not be rendered and grounded upon a future condition or contingency, see *Battell & Collins* v. *Lowery et al.*, 46 Iowa 49. In the course of the opinion in that case the court said:
>
> "If there was a present judgment, it was at most a judgment that there should be a judgment. But we cannot sanction such an anomalous proceeding."

The cases cited by appellant to the effect that a court of equity may impose conditions on relief granted to a complainant asking an injunction are so plainly inapplicable to the case at bar that discussion of the proposition seems a work of supererogation. The appellant does not seek to impose a condition on the appellee, for the court admittedly can not

require Congress or the Secretary of War to authorize the building of the compensating works. The appellant instead is seeking by indirection to obtain from the court a permit to do something forbidden by valid legislation, and as a consideration for the dispensation offers to submit to a condition which can never be enforced against it. It asks that its illegal acts be legalized.

Cases having to do with the rights of a court of equity to require security in the form of a bond from a complainant or to require that a complainant recognize an equitable right of the defendant are not in point. The maxim that he must do equity who asks it has no application to the facts now before the court.

D

The decree for an injunction should be effective immediately

Under its Point IX (b) appellant argues that the operation of a decree for an injunction should be postponed until "appellant and the cities, villages, and towns within its limits can readjust their works of sewage disposal or of purifying the water supply." (Appellant's Brief, p. 218.) Apparently appellant is really asking a postponement until at least 1945. Appellant plans, between now and 1945, to construct artificial purification works *only* to take care of sewage *in excess of that disposed of by 10,000 c. s. f.* After that it plans to install works to purify the sewage now taken care of by the unlawful diversion. Having in mind the time already wasted this proposal simply

postpones the vindication of the rights of the United States to the Greek Kalends. Substantially the only reason suggested by appellant for the long delay is that *state* limitations on appellant's power to raise revenue by taxation and bonds will not permit an earlier accomplishment of these objects. The United States need not await the pleasure of the Legislature of Illinois to enforce the rights of the former.

If this Court should deem these matters material, appellee should have an opportunity to controvert the testimony.

Appellant's argument under this heading is but a reiteration of what it has elsewhere urged under the heading of "comparison of equities" and also in connection with its motion of July 12, 1920. The answer, too, is the same.

In the first place, to enter a decree, such as appellant asks, is but to recognize that appellant *has* equities or a partial *defense* against the claim of the United States. The paramount power of the United States over interstate commerce becomes subject to conditions not to be found in the Constitution and arising solely from the unlawful and reckless acts of appellant.

As was stated in the Debs case, 158 U. S. 564, the United States need not have appealed to its Courts for the peaceful determination of the questions arising from a defiance of its sovereign power:

> The strong arm of the national government may be put forth to brush away all obstructions to the freedom of interstate

> commerce or the transportation of the mails. If the emergency arises, the army of the nation, and all its militia, are at the service of the nation to compel obedience to its laws.

Appellant's obstruction might have been forcibly abated. The right of the United States is absolute and immediate. Is it to be qualified because the *state* has placed a limitation on appellant's power to raise revenue?

In the second place, and this is really another aspect of the same question, to delay the operation of the injunction is, in effect, to give appellant a *permit* to divert 10,000 c. s. f. for the period of the delay. This, however, is a *legislative* power, to be exercised only by Congress and, to a limited extent, by the Chief of Engineers and the Secretary of War. Their determination is *conclusive* (see our Point III, E and F, supra, pp. 181 to 184).

The proper forum, then, for the presentation of appellant's equities is in Congress, the Secretary of War having determined the unauthorized diversion to be an obstruction. If time is needed for the adaptation of appellant's works to the decree, there is no reason to doubt that Congress will give that time by a temporary permit. It cannot be assumed that Congress will act arbitrarily or unjustly. Congress has already declared the diversion to be unlawful by its prohibition of obstructions in Section 10 of the Act of 1899. It is for Congress to give it a temporary legitimization if that is necessary.

In its Point IX (d), appellant concedes that "this matter should be settled by Congress." (Appellant's Brief, p. 226.) With this we thoroughly agree. It *has* been settled by Congress by its enactment of the Section 10 of the Act of 1899 and the present unauthorized diversion is prohibited and unlawful. If it is to be made lawful, either temporarily or permanently, that *too* must be settled by Congress, not by appellant.

Appellant has recognized, also, that Congress is the proper forum for relief for, as is stated in its brief (p. 226), bills in its behalf have been and *are* pending in Congress.

> The hearings on these bills were not concluded when the last session of this Congress ended, and the Committee adjourned to take up the matter at the next session of this Congress. The said bills are still pending, undisposed of by said Committee on Rivers and Harbors of the House, no action has been taken thereon, and they have not yet been reported. (Appellant's Brief, p. 226.)

Presumably, Congress, in the exercise of its sovereign power, will accomplish a just solution of the problem. Whether the solution pleases appellant or not, it will be conclusive. It may find that appellant should be permitted to take 10,000 c. s. f. It may find that that is too much, and that appellant's arguments and conclusions based on the supposed maximum run-off of the Chicago River are not accurate or well founded. Is this Court to take from Congress its freedom and power to deter-

mine the matter conclusively and effectively for the best interests of the Nation as a whole? It would, if it suspended the operation of the injunction for any considerable period of time. This would enable the appellant again and for another period of many years to stake the lives and health of a great city on a *hazard* that by the end of that time it would have persuaded the United States to legalize its diversion. In this connection we quote from the opinion of the Secretary of War in his decision rendered January 8, 1913:

> A recent report of the engineers of the sanitary commission (Oct. 12, 1911) proposes eventually to use some such method, but proposes to postpone its installation for a number of years to come, relying upon the present more wasteful method in the meanwhile. It is manifest that so long as the city is permitted to increase the amount of water which it may take from the Lakes, there will be a very strong temptation placed upon it to postpone a more scientific and possibly more expensive method of disposing of its sewage. This is particularly true in view of the fact that by so doing it may still further diminish its expenses by utilizing the water diverted from the Lakes for water power at Lockport. (Appellant's Narrative, pp. 35–36.)

It is now over sixteen years since the Calumet River suit was instituted; it is over eleven years since the Secretary of War rendered his decision denying appellant's application for an increased diversion; it is over twenty-eight years since appellant had its

first official warning (in the permit of July 3, 1896) that permission to divert water, and how much, were matters of uncertainty. Now it wants not only until 1945 but an indefinite period beyond that.

Appellant may, however, direct the attention of this Court to the decree in the first Wheeling Bridge Case, 13 How. 553. In that case the decree provided that the Bridge Company should have until the following February 1st to make the changes in its bridge necessary to remove the obstruction. The State of Pennsylvania, however, was suing in its proprietary right and the parties appeared before this Court in the character of private individuals. There was no occasion for a question of the assertion of the paramount and exclusive jurisdiction of Congress. When Congress later exercised that jurisdiction this Court held itself bound by it. (18 How. 421.)

This grave question, so long unsolved, will never be solved by the only department of the government that can solve it (namely, Congress) until this litigation is ended by this Court by a decree that is *definitive and obligatory*. Such a decree, declaring the just rights of the United States and requiring prompt respect by the Sanitary District for the rights of the Government, need not be inconsistent with any existing power of the Secretary of War, acting upon the recommendation of the Chief of Engineers, to grant a temporary permit pending the action of Congress.

CONCLUSION

The length of this brief, as well as the dimensions of the record in this case and the time consumed in bringing it to a conclusion, are out of all proportion to the difficulty of the legal issues. There never has been any serious question either of law or of fact since the institution of the Calumet River suit in 1908. While counsel for appellant have devoted an imposing brief to an attempt to justify appellant's conduct, their claims, on examination, prove to be mere challenges of elementary and well-settled principles of law, or arguments based on facts which are not present in this case.

In our review of the cases and the principles established by them, we have, therefore, been forced to make constant reference to "propositions which may have been thought axioms." We offer in excuse the considerations to which Mr. Chief Justice Marshall gave expression near the close of his opinion in *Gibbons* v. *Ogden*, 9 Wheat. 1, 222:

> The conclusion to which we have come depends on a chain of principles which it was necessary to preserve unbroken; and, although some of them were thought nearly self-evident, the magnitude of the question, the weight of character belonging to those from whose judgment we dissent, and the argument at the bar demanded that we should assume nothing.

The instant case is unique in that while its far-reaching consequences affect vitally the interests of a whole nation and are of a magnitude not easily

exaggerated, its *justiciable* issues are comparatively insignificant. Appellant's brief argues little if anything that was not determined against appellant by Chief Justice Marshall in *Gibbons* v. *Ogden*, reaffirmed again and again by this court. It is a matter of regret that both appellant and appellee should have been caused the expenditure of time, money, and effort by this protracted and unnecessary litigation.

In insisting upon its paramount and exclusive control over the subject-matter of this litigation, the Government of the United States is performing an unpleasant and yet unavoidable duty. It is trustee of the navigable waters of the United States for the use, benefit and enjoyment of the whole Nation and it would betray that trust if it suffered appellant's defiant challenge to pass unnoticed, particularly when other States of the Nation and a foreign government are complaining. The appellee is entrusted, too, with exclusive control of the Nation's relations with foreign countries and it can not permit either a state or a municipal corporation to deal with its international problems.

Yet the Government's position must not be misunderstood. Nothing that has been urged before this court is intended to belittle or ignore the welfare of the great and progressive community growing within appellant's district. Whether the emergency is as great as certain of appellant's witnesses have intimated, or not, Chicago's problem in this matter is a serious and perplexing one, in which the entire Nation should take a sympathetic interest and to the

solution of which the Nation by its duly constituted authorities should address itself without delay.

In solving this question, however, the Nation must, under its Constitution, act through its Congress and not through its courts. Once this Court has made a declaration of appellee's sovereign right and has pronounced unlawful appellant's invasion of that right, the way will be cleared for the presentation of Chicago's case to the only forum which can render a valid decision on its merits. The issues will then be unobscured and uncomplicated by frivolous defenses, which, although advanced by appellant for many years, require little time of this or any court for their decision.

Throughout this litigation the Government of the United States and its legal representatives have not been unmindful of the welfare of the people of Chicago. Within the scope of its delegated power, the Federal Government (and not the Sanitary District) represents the people of Chicago; and, so representing them—whose truest welfare must be that of the whole people of the United States—the Federal Government has endeavored to act in this matter for the common welfare. Certainly it has not been lacking either in consideration or patience in this litigation. But in its deep concern for the welfare of Chicago, the Government must also have regard for the rights and interests of the great States and populous cities which have equal rights in the waters of Lake Michigan.

It is a condition and not a legal theory that confronts the Government. The question is not judicial, and this

Court will presume that the Legislative and Executive branches of the Government will not be unmindful of all the equities of the situation.

As this serious problem will require time for its careful consideration, the Government can not object, if the Secretary of War, acting on the recommendation of the Chief of Engineers, sees fit, pending the action of Congress, and as a modus vivendi to modify the existing permit and temporarily permit a greater diversion of waters.

If there be any doubt as to his power under the authority already delegated to him, the Government has no objection to a proviso in any decree that this Court may enter which will provide that the decree and the injunction, while immediately effective, shall be without prejudice to any temporary permit that the Secretary of War, acting upon the recommendation of the Chief of Engineers, may see fit to grant in the nature of a modus vivendi, pending the action of Congress in the premises.

This would set at rest the authority to make some temporary arrangement in the event the present Congress could not dispose of the question before it adjourns sine die on March 4, and especially in the event that Congress might not be again in session until the first Monday of December next.

It should, however, be made clear that the recognition and enforcement of the just rights of the United States Government are not to depend on or to await the conclusion of any agreement between the Sanitary District and the Government. It should not be a question of what

the Sanitary District should now concede, but what the Government of the United States should now allow.

If Congress, (or the Executive, to the extent of its delegated power,) voluntarily and in consideration of the inherent difficulty of the situation and the welfare of the people of Chicago gives some temporary permit until the whole problem can be finally solved by Congress, there should be no further opportunity for the Sanitary District to begin the litigation afresh and prolong it for another sixteen years under the plea that the decree of this Court was entered upon the faith that the Sanitary District and the United States Government should make some contract in the matter.

The question is not one of contract, but of governmental power. The United States has the right to stop the unlawful diversion by the Sanitary District of the waters of Lake Michigan for the uses of the City of Chicago.

In exercising this power, it need not bargain or contract with the Sanitary District.

Its power is not that of a coequal, as the learned counsel for the Sanitary District seem to intimate, but the power of a sovereign.

It was not necessary for the Government to go into the United States courts to assert rights which were so clear or to discharge duties which were so imperative. Nothing more clearly marks its consideration for the people of Chicago than that it consented, before enforcing its undeniable rights, to go into its courts, and the patience with which it has accepted the inordinate and

inexcusable delays in this litigation show the keen desire of the Government that no possible injustice should be done to the people of Chicago.

Is it not time to consider the welfare of other cities and great States? The interests of all the people, for whom in this matter the United States stands in a great trust relation, imperatively require that the power and authority of the United States should now be vindicated so clearly and emphatically that the Sanitary District may have no further excuse to persist in its unlawful diversion of lake waters by treating the decree of this Court as a pretext for fresh litigation. Assuredly the Sanitary District has had its day in court and the time has come when it should obey the laws of a country, of which it is but a part.

In the Supreme Court of the United States

OCTOBER TERM, 1924.

THE SANITARY DISTRICT OF CHICAGO, *Appellant*,
vs.
THE UNITED STATES OF AMERICA, *Appellee*.

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE NORTHERN DISTRICT OF ILLINOIS, EASTERN DIVISION.

THE CASE.

The injunction is (Rec. Vol. VIII, p. 131) that the Sanitary District be "enjoined from diverting or abstracting any waters from Lake Michigan over and above or in excess of 250,000 cubic feet per minute"—or 4167 feet per second.

The statement of defendant in answer and exhibits (Vol. VIII, pp. 9 and 58) is that on permit from Secretaries of War to take 250,000 feet per minute (4167 feet per second) defendant is abstracting 480,000 feet per minute, and the proof indicates even more, for purely local benefit and economy in sewage and trade waste disposal, cheapened by the manufacture of electric power on a large scale.

It cannot be denied and the court below finds, that on the evidence it cannot be controverted that this results in lowering lake levels, and the abstraction of the excess over 250,000 feet per minute impairs seriously the navigability of the Great Lakes water route—the great-

est and cheapest in the world. (The conceded total reduction of the lake levels is 5½ inches and even greater in the St. Lawrence River.) The Court finds that this inflicts a direct loss to those dependent on the water navigation route.

In the report of the International Waterways Commission, 1907, (Vol. IV, p. 2421), the direct yearly loss to vessels alone in freight earnings is conservatively placed at a million and a half, but this is put on good authority of President Livingstone, of the Lake Carriers' Association, on figures produced (Vol. I, pp. 205-6-7) at easily a half million dollars per inch of reduced draft, which would amount to some four million dollars annually for six inches—and that was in 1909. His testimony goes fully into the subject and see Coulby (Vol. I, p. 428). It must be taken into account that the traffic is rapidly increasing and has been since this testimony was given in 1909, the iron ore alone in 1920 amounting to 64,512,000 tons (Vol. VIII, p. 220).

But there is also the vast loss and damage to some 106 improved harbors in the States fronting the Great Lakes and over 50 on the Canadian side—and to the country at large and its industrial business dependent on the Great Lakes route for the annual movement of more than a hundred million tons of raw materials and other commodities wherein the saving in freight rates, compared with the cost of rail transportation, easily reaches or exceeds a quarter of a billion dollars every year.

The object and being and purpose of the defendant Sanitary District are avowedly for local sewage treatment only, to which has been added manufacture of electric power to reduce the expense. Mention is here

and there made in the Record of a navigation channel to connect the Mississippi system of river navigation with Chicago by joint action of the United States and Illinois; but that is still in the future. Examinations and surveys by the United States show, however, that the requirements of such a channel would not exceed 1,000 cubic feet per second (Vol. VIII, p. 54); and in the instant case the injunction is against the sanitary canal exceeding 4,167 cubic feet per second.

Defendant-appellant, confessing in answer the abstraction of a great excess of water over 4,167 feet per second and that the entire diversion and abstraction is used for non-navigation purposes referred to, a convenient, and with the power production, the cheaper method—claims the right under a general state statute of 1889, authorizing the formation of sanitary districts to care for local sewage, with some details applicable to such a District if one should be set up at Chicago, and in that case to take from the Lake and use whatever might be necessary to its purposes, and, under a supplemental act of 1903 specifically authorizing such District to erect works to develop power, raising the necessary money by local taxation.

The answer also avers, as will be later shown, that the Sanitary District has never recognized and denies any right or authority of the United States to interfere, although (see finding of District Court Vol. VIII, p. 151) from the very beginning it has applied to succeeding Secretaries of War not alone for the original permit, but repeatedly for increases thereof—which have been denied—and the thousands of pages of Record are replete with applications to the Secretary of War for permits or increase, official reports of government engineers, etc.

In fine, the right and authority of the general government are now unqualifiedly denied by defendant-appellant.

The injunction was granted by the District Court at Chicago. The facts and the law were passed upon and decision and opinion rendered (orally) by Judge Landis (Vol. VIII, p. 149), and again, after his retirement, on motion to modify, by Judge Carpenter (Vol. VIII, p. 127). And there appears also in the Record (Vol. VII, p. 7 and also Vol. VIII, p. 50) the well considered decision and opinion of Secretary of War Stimson (Jan. 8, 1913) in which he reviews the facts on the record made before him, and the law.

All three are challenged in their findings of fact and of law—which were to the effect that there was serious impairment and damage to the navigability of the Great Lakes water route from the unwarranted abstraction of water,—that the right of navigation was paramount and the United States did have authority and right to interfere, and, furthermore, that even for sewage disposal there was no justification or necessity for such lavish use and waste of water.

Statements of facts will have been presented in briefs of counsel for the parties. For our own part we deem the admissions of facts in the answer and exhibits of appellant herein to be sufficient to call for affirmance of the decree below by the two District Judges in Chicago, each of whom was frank to state a personal sympathy toward another result; and sufficient to support the conclusion and decision of so good a lawyer as Secretary Stimson, whose opinion is incorporated in the Record (Vol. VII, p. 7; also Vol. VIII, p. 50). The findings of all these the appellant specifically challenges.

CONNECTION OF THE LAKE CARRIERS' ASSOCIATION WITH THE SUBJECT.

The interest of the Lake Carriers' Association, which prompts the application for and leave to file this brief, should not be misunderstood. It is a business league composed of members who own and operate ships on the Great Lakes, not itself owning or operating or financially interested in any respect soever in any ship. But, through its membership, it has been alive to and at all times attentive to everything tending to the improvement of or threatening the navigable capacity and usefulness of this great water transportation route, which, to common knowledge, has grown to such enormous proportions as that it furnishes the country at large the cheapest and most efficient transportation known to history of such raw materials as grain, iron ore, coal, stone and other commodities, therein performing a ton-mile service exceeding 25 per cent of ton-mile service by all railroads in the United States, and being substantially one-half that of the railroads east of the Mississippi and north of the Ohio River in the general region in which the Great Lakes lie; and this at a cost, over and by means of this great, open, free, competitive national and international highway, which compared with similar service by railroads, if that were possible, is one-fifth or less. It is common knowledge also, that in the procession of business events this spread grows larger.

The haul from the head of Lake Superior or of Lake Michigan to the foot of Lake Erie is approximately a thousand miles. The rate of iron ore (by the long ton) for this distance, is not more than for a rail haul of 125 to 150 miles. Enough wheat to make a barrel of

flour is commonly carried a thousand miles for about 10 cents,—a ton of coal for less than the cost of shoveling it into the basement of one's home. These and other similar statistics appear fully in the Record, and, indeed, being of common knowledge, are neither in dispute nor disputable.

DIRECT LOSS TO SHIPPING.

The members of the Association, as private ship owners, have personal interest in averting the calamity of heavy direct loss, which will be later referred to, from the impairment of the navigable capacity of the Great Lakes, such as has been already occasioned by the abstraction of unprecedented quantities of water by the Sanitary District at Chicago, which, we may remind here in passing, is taken for purely local benefit for sewage purposes by, what the Record shows to be, a more convenient method, as against not only possible but other reasonable and well known methods in world wide use, which do not require any such extravagant waste.

THE PUBLIC INTEREST.

It is also fitting that such an Association present argument here on a broader question than personal loss to its members, since in the evolution of business in this country the farming interests of the northwest and the iron and steel industry depend upon the cheap transportation by this waterway, and as well the distribution of coal to the northwest. In the evolution billions of dollars have been invested and many millions of our population have come to be employed on the farms, in the mines of iron ore and coal, the quarries of stone, the docks and other terminals, furnaces, ships, shipbuilding plants and every conceivable thing that goes into the

cosmos of the gigantic industry and the social enterprises of the whole country.

Recognizing the necessity of taking advantage of this cheap water route and for its development and fullest utilization, the whole country being directly interested, our Government, and the same is true of the Canadian Government, has been keenly alive and satisfactorily active in its improvement and against any impairment for local benefit, throughout the whole route; improving it in respect to dangerous shoals and narrow and restricted channels connecting the different lakes. Even by 1911, (Vol. VI, p. 3624) our own Government had expended $100,000,000. This has included the construction of great locks and appurtenant canal at Sault Ste. Marie to overcome the fall of nearly twenty feet between Lake Superior and the lower lakes; large improvement of channels at the foot of Lake Superior and throughout much of St. Mary's River, both above and below the locks at the Soo, down to Lake Huron, including an artificial cut of several miles to shorten the distance and avoid dangerous conditions in the navigation of the river, marking the channel with ranges and lights so the great steamers can run the river at night, and nearly all of this is under Government regulation in the navigation of ships. Not to particularize too far, again at the foot of Lake Huron and the head of St. Clair River, large improvements have been made, in enlarging, deepening and taking out obstructions to navigation, and again at the foot of St. Clair River, where it debouches into Lake St. Clair; then all of the 25 miles across Lake St. Clair, and, in the Detroit River, where, in its lower end, our Government has established, additional to previous channels, the greatest channel improvement in the world in the Livingstone Channel; and

so on below that and at the head of Lake Erie are miles of dredged improved channels, and at Buffalo a six million dollar improvement in the Black Rock Canal and lock, and Government assistance has been freely given in aid of terminal harbor improvements. Besides, many millions have been expended for lighthouses, fog signals and coast guard service.

Over all of this the Government exercises its supervision for the preservation and maintenance of the water route, and there is a system of lake surveys, a hydrographic service, and all of the adjuncts necessary to preserving and improving and making for greater usefulness to the nation all this as an open and competitive free waterway, without a dollar of tolls and over which, according to public statistics, 121,000,000 tons of cargoes are already carried in a single season of navigation.

From the Record in this case and from public and general Government statistics, and of general knowledge, the saving by this route to the people of the United States is in every year more than the total that the appellant claims to have been able to spend and would be required to spend to care for its sewage.

In considering a question of admiralty and maritime jurisdiction, Chief Justice Taney said of the Great Lakes in 1851, (*The Genessee Chief*, 12 Howard, at 453):

> "If the meaning of these terms was now for the first time brought before this Court for consideration, there could, we think, be no hesitation in saying that the lakes and their connecting waters were embraced in them. These lakes are in truth inland seas. Different States border on them on one side, and a foreign nation on the other. A great and growing commerce is carried on upon them between different States and a foreign nation, which is sub-

ject to all the incidents and hazards that attend commerce on the ocean. Hostile fleets have encountered on them, and prizes been made; and every reason which existed for the grant of admiralty jurisdiction to the general government on the Atlantic seas, applies with equal force to the lakes. There is an equal necessity for the instance and for the prize power of the admiralty court to administer international law, and if the one cannot be established neither can the other."

Nine years later (1860) the court, by Nelson, J. said, (24 How. 38):

"According to the best official statistics, the value of the property annually, the subject of this commerce, exceeds $600,000,000, employing more than sixteen hundred vessels, with an aggregate tonnage exceeding 400,000 tons. These vessels are duly licensed for the foreign trade, as well as for that carried on coastwise. This commerce, from its magnitude, and the well known perils incident to the lake navigation, deserves to be placed on the footing of commerce on the ocean; and, we think, in view of it, Congress could not have classed it with the business upon rivers, or inland navigation, in the sense in which we understand these terms.

These Lakes are usually designated by public men and jurists, when speaking of them, as great inland waters, inland seas, or great lakes; * * *."

The Record (Vol. IV. p. 2420) shows this tonnage by 1907 to have reached approximately two million tons Custom House measurement, which is approximately one-half the cargo carrying capacity, the numbers of the vessels being less because of their very great increase in size from year to year.

Later, in 1892, this Court, speaking through Field, J., said of the Great Lakes (146 U. S. 436):

"The Great Lakes are not in any appreciable respect affected by the tide, and yet on their waters, as said above, a large commerce is carried on, exceeding in many instances the entire commerce of States on the borders of the sea."

In report on "Diversion of Water from the Great Lakes and Niagara River," by the United States Board of Engineers for Rivers and Harbors, August 30, 1919, transmitted by the Secretary of War, December 7, 1920, to the Speaker of the House of Representatives, at page 91, we find:

"The Great Lakes system forms one of the world's greatest highways for water-borne transportation. The Great Lakes fleet moves more than 100,000,000 tons of freight each season. • • • These vessels are from 280 to 625 feet in length and have a carrying capacity of from 3,000 to 15,000 short tons. Most of them can be loaded to a draft of about 22 feet. They are the most economical carriers in the world, their rates usually being less than one tenth of a cent per ton-mile, and sometimes only a third of that amount. Rail rates are several times as much, often being at least 10 times the water rates. The annual saving over the cost of moving this same freight by rail exceeds a quarter of a billion dollars."

In reference to the waters of the Great Lakes, some general principles laid down by the International Waterways Commission may well be accepted:

1. In all navigable waters the use for navigation purposes is of primary and paramount right. The Great Lakes system, on the boundary between the United States and Canada, and finding its outlet by the St. Lawrence to the sea, should be maintained in its integrity.

2. Permanent or complete diversions of navigable waters or their tributary streams should only be permitted for domestic purposes and for the use of locks in navigation canals.

3. Diversions can be permitted of a temporary character, where the water is taken and returned, and when such diversion cannot interfere in any way with the interests of navigation.

As to the foregoing matters, we assume that apt reference to the record will be made in the main briefs, but all these matters are beyond dispute and of such public record and common knowledge that we believe the Court will not fail to take judicial notice.

We then have, according to published reports and the testimony in the case not to be disputed, that the direct loss to the individual ship owners by a diminution of 6 or even 5½ inches, the conceded impairment here, would, according to testimony which should be accepted (Lake Carriers' President Vol. I, p. 205), amount to some four million dollars a year, assuming an average rate of 50 cents per ton as in 1916, which capitalized, at 5% would be eighty million dollars. And the testimony is that vessel owners keep close track of the stage of water and take advantage of every period of high stage to load their boats to greater draft. During the time when low stage prevails, they are correspondingly handicapped and the carrying capacity of the fleet is materially reduced.

The effect of abstracting 10,000 cubic feet per second at Chicago lowers the lake levels by at least 5½ inches; that is, all of the lakes below Superior, which is some 20 feet above the waters below, requiring the locks at Sault Ste. Marie; and this effect is more serious as we go down the system through the St. Lawrence to the sea.

GREAT LAKES-MISSISSIPPI WATERWAY.

To dispose of the shibboleth of navigable canal or channel to connect with the Mississippi Valley improvement of our great interior rivers, surely we need go no further in this case where the decree prohibits and enjoins the use of more than 4167 cubic feet per second, than to say that the Record shows, according to Government report, that a depth of not over 10 feet is all that could be utilized for such a waterway, ample to comport with the channels of the Mississippi, existing or proposed, and sufficient to accommodate an annual commerce of one hundred million tons; and that less than 1,000 cubic feet per second from Lake Michigan would amply supply the needs and the use of such channel (Vol. VIII, p. 54). This is the utmost that the vision of this generation can see for the future.

The United States Statute of 1827 is referred to by defendant as in some sort justifying the granting of unlimited authority to take water from the Lakes for these unnecessary non-navigation purposes of dilution of sewage and manufacture of power for Chicago and its environs and all increase of population.

That act was in terms confined to a navigation canal to connect the Mississippi with the south end of Lake Michigan, not specifying Chicago or any particular point. It granted certain lands in aid of building such a canal. There was no right expressly conferred to take any water from the Lakes by that Act. But a canal, the Illinois and Michigan, was built and operated for years, without taking any appreciable quantity from the Lake, and that canal has apparently fallen into desuetude.

It is idle to argue this as supporting the claims of the Sanitary District (formed expressly for non-naviga-

tion purposes) to extract for that purpose many times the admitted requirements of a navigation channel.

The Illinois act of 1889, on the other hand, is a general statute authorizing formation of Sanitary Districts anywhere in the State—and providing only that if one is made to connect with certain rivers, the United States shall be authorized to operate said channel for navigation—"*but not to interfere with its control for sanitary or drainage purposes.*" See Sec. 24, Act 1889 (Exhibit A—Vol. VIII, p. 105).

DEFENDANT CLAIMS RIGHT TO UNLIMITED ABSTRACTION FOR SANITARY AND DRAINAGE PURPOSES.

The answer of the defendant in the main channel case (paragraph 26), in which the injunction was granted, avers that the Sanitary District was authorized by the State to construct a channel of sufficient size to take care of not only the sewage and drainage of the City of Chicago and its environs, but also the sewage and drainage as the increase of population might require.

In the Record, Vol. VII, p. 13 and VIII, p. 55, the published report of the President of the Drainage Canal, as was submitted at a hearing before Secretary Stimson, is quoted as saying:

> "I am of the opinion that the presumption that our water supply is to be limited to 10,000 cubic feet per second, or 600,000 cubic feet per minute, is gratuitous and mischievous and should not be voiced by the officials of this district. I believe that we should have the volume requisite to our needs as they appear and are justified;"

on which the Secretary comments:

> "It is therefore quite conceivable that compliance with their Sanitary needs according to this method of sanitation may eventually materially change this great national water course now existing through the Lakes."

In the answer, paragraph 40, (Vol. VIII, p. 87), it is further averred:

> "Defendant has never recognized the right of the United States in any manner to interfere with the construction, operation or use of the Main Channel of the Sanitary District or any of its adjuncts or additions; that it has never recognized the right of the United States in any manner to determine or direct how the said Main Channel or its adjuncts or additions, as hereinbefore mentioned, should be operated or used, or the amount of water that should be abstracted from Lake Michigan through its various channels or adjuncts or additions thereto to carry out the provisions of said Act of May 29, 1889."

And in Paragrap' 26 of the same answer, (Vol. VIII, p. 77), that, it was f rther provided by said Act, under which the Sanitary District was organized, that the channel, when completed, should be a navigable channel of the United States and that the United States should

> "have authority to take over and operate said channel, for navigation purposes, but not for sanitary or drainage purposes."

The language of the statute, however, is "not to *interfere* with its control for sanitary or drainage purposes."

THERE ARE OTHER AVAILABLE METHODS OF SEWAGE DISPOSAL.

The answer admits that there are other methods of sewage disposal although claiming, in Paragraph 43, that the only method by which defendant can *efficiently* take care of and remove the sewage and drainage from its limits and protect the water supply of the inhabitants of Chicago and its environs is the one laid out under the Act of May 29, 1889, and acts amendatory and supplementary thereto. One of these subsequent acts was that of May 14, 1903, referred to in Paragraph 32 of the answer, (Vol. VIII, p. 81). It was:

> "To enlarge the corporate limits of said District and to provide for the navigation of the channels created by said District, and to construct dams, water wheels and other works necessary to develop and render valuable power arising from the water passing through its channels, and levying taxes therefor."

The answer then proceeds to say (Paragraph 32) that by about 1907 the defendant had then completed works at a cost of "approximately" $5,000,000, producing power worth "approximately" $900,000 per year net; which revenue "is used toward defraying the other expenses of defendant."

Other testimony would tend to show a greater revenue, which would increase with increase of flow. The testimony of defendant's engineer, Randolph (Vol. VI, p. 3599) is that a flow of 10,000 cubic feet per second would develop Horse Power to the annual value of $2,750,000—computed at the low rate of $25.00 per H. P.,—at the net yearly value stated in the answer of $30.00, it would be over three and a quarter millions.

It is to such uses that defendant puts the water abstracted from a great water navigation route, never to be returned, claiming good right to further increase the quantity according to its own view of its necessity for such use, and which it may well be said might go on until it would materially change this great natural water course existing through the Lakes.

We submit that it appears throughout the Record that Chicago can, by modern, approved, scientific methods well known and adopted by many other large communities, dispose of its sewage. It appears (Record, Vol. VIII, p. 192), that Chicago is itself erecting such works on a large scale. In the decision referred to of the Secretary of War in 1913 (Record, Vol. VII, p. 14 and VIII, p. 55), it was said that the evidence:

> "satisfies me that it would be possible in one of several ways to at least so purify the sewage of Chicago as to require very much less water for its dilution than is now required by it in its unpurified condition. A recent report of the engineer of the sanitary commission (Oct. 12, 1911), proposes eventually to use some such method, but proposes to postpone its installation for a number of years to come, relying upon the present more wasteful method in the meanwhile. It is manifest that so long as the city is permitted to increase the amount of water which it may take from the Lakes, there will be a very strong temptation placed upon it to postpone a more scientific and possibly more expensive method of disposing of its sewage. This is particularly true in view of the fact that by so doing it may still further diminish its expenses by utilizing the water diverted from the Lakes for water power at Lockport."

THERE IS NO ESTOPPEL AND NO ACQUIESCENCE IN THE EXCESS DIVERSION.

In paragraph 37 of the Answer (Vol. VIII, p. 84), endeavor is made by averments to attach some action of Congress through the permit of Secretary of War Alger and the action of Secretary Root in 1903, which limited the quantity to 250,000 feet per minute, and reports of the Waterways Commission, appropriations for surveys of tentative or possible channels for navigation, reports of engineers, and so on, with the effect in some indefinite way to estop the Government of the United States or deprive the Government from the exercise of its authority to safeguard the rights of the people of the United States against the impairment of the navigability of a great public, national and international water course. This is answered by the finding of the court below (Vol. VIII, p. 151)—that the Federal Government has been recognized from before the beginning of the diversion and that the constant attitude of the defendant was a recognition of the control of the Federal Government over this whole question.

The annual report for 1916 of Secretary of War Baker, at page 64, says this:

> "A conditional permit was granted in 1901, authorizing the diversion of 4,167 cubic feet seconds, and this amount has continued to be the legal limit. The drawing of water from the Chicago River into the canal affects the general navigation interests of the country on account of the tendency of such diversion to lower the level of the waters of the Great Lakes. From the beginning the operations of the Sanitary District have been looked upon with disfavor by navigation interests, and the Secretary of War has not only declined to increase the

diversion temporarily authorized, but has adhered to the decision that the permit granted was of a temporary character and that no permanent diversion of the waters of Lake Michigan could be made without express authority from Congress. Nevertheless the Sanitary District has for many years been withdrawing a much larger amount of water than is authorized by this permit. Upon two different occasions the Sanitary District has refused to conform to decisions of the Secretary of War declining to grant authority for larger diversions and has declared its intention to continue excess diversions unless prevented by injunction. Accordingly, in 1908 and again in 1913, bills in equity were filed at the instance of the War Department by the Attorney General seeking to enjoin excess diversion. The two suits were consolidated and tried in the United States District Court for the Northern District of Illinois, but remain undecided.

It seems quite clear that with the growth of population in Chicago the authorites of the Sanitary District contemplate still larger diversions than those already made, perhaps, to the extent of 10,000 cubic feet seconds. This, it is estimated by the United States Lake Survey, would lower the waters of Lake Michigan and Lake Huron nearly 7 inches, Lake Erie about 5½ inches, and Lake Ontario about 4½ inches, mean lake levels, the reduction being much greater at low-water periods. The effect of such a lowering of lake levels would obviously be enormous losses to navigation interests and would necessitate large expenditures by the General Government for the restoration and reorganization of river and harbor improvements on the Great Lakes and their connecting waters, for which already appropriations aggregating more than $90,000,000 have been made."

And see opinions of Judges Landis and Carpenter (Vol. VIII, p. 149, and p. 127).

LOCAL AS AGAINST GENERAL NATIONAL INTERESTS.

The case really is admitted to be on the facts a simple question of local convenience, advantage and gain, in defiance of the paramount right of navigation for which all this navigable water is held in trust for the public, and the authority and responsibility for the conservation of which is in the United States, as to waters of the United States and in a foreign nation as to its part of the navigable waters; and against the interest of all the rest of the people of the United States and, for that matter, of Canada, and all of the investments in and of other states and cities fronting the Great Lakes and the docks, ships, farms, mines, furnaces and all other ramifications involving investments of billions of dollars and the industrial and domestic interests of the millions of people, whose cause appeals to the Governments on both sides of the waterway through a length of many thousands of miles.

Grant, that Illinois may own the fee of the bed of the Lake. This is a qualified fee, burdened with the public trust for navigation. Illinois, in the general provisions of the Act of 1889, or in any special provision of that Act or in the subsequent Acts, has not pretended to grant to the Sanitary District the State's qualified title to the submerged lands of its Lake front (Record Vol. VIII, p. 103, Sec. 22, Act 1889). But if it had attempted this, it could not, by possibility, shake off the trust which qualifies its fee, much less may it be claimed that Illinois with about 60 miles of lake frontage could, if it would, impair the navigability of all the waters in and in front of the seven other states fronting the Lakes or any of the other thousands of miles of lake and river

frontage because over all the paramount public right of navigation and authority and responsibility are vested in the United States by reason of the complexity of state, individual and other right of control over their interstate commercial waters and their care and control, and the responsibility of supervising and protecting all these against private or local encroachment or impairment for local advantage and authority to protect all against any breach of the great trust.

SUGGESTION OF COMPENSATING WORKS AND TREATY.

As has been suggested it is not the purpose to argue *in extenso* all of the various facts that have been put forward by the appellant. In justification we may speak briefly of the appellant's suggestion about compensating works.

The Record shows that anything in the nature of works to effect a compensation for the lowering caused by the excess withdrawal of water at Chicago would involve some system of works throughout the whole Great Lakes and St. Lawrence waterway. This, as stated by Secretary Stimson (Vol. VIII, p. 65) would involve some joint arrangement with Canada. This is inescapable. The Record, while it speaks on the subject of such works, is silent as to any definite plan. There is no precedent—there are various suggestions.

It appears that as far back as 1900 there was a partial plan by a dam at the head of the Niagara River which was abandoned. Whether such works could be established, appears, as far as the record is concerned, to be a matter of conjecture and opinion. In other words, there is nothing tangible about the character of

the works, which would have to be some general character.

This suggestion was not accepted by the lower court and motion to suspend the entering of a decree for injunction was denied (Vol. VIII, p. 130). At the same reference appears the statement of the District Court that,

> "It is doubtful whether the State of Illinois could authorize expenditures to be made in foreign states and foreign countries to restore the water levels."

We submit that in view of the claim of defendant that its finances and means of raising of funds will not enable it to complete the works for the scientific, modern method of sewage disposal and purification of water before 1945, it is a doubtful proposition to pay whatever may be the cost of such compensating works throughout the Lakes as might be decided necessary by the two governments, and we suggest that there can be little doubt of the right of a taxpayer in Illinois, or in the Sanitary District, to enjoin the imposition of taxes for the purpose of expending money in works in other states or in a foreign country, or both.

So far as the Treaty, itself, is concerned, as a recognition: It is clear in its terms and there is absolutely no recognition of the Chicago Drainage Canal District. That, as said by Secretary Stimson, seems to have been carefully excluded. There is no indication in the Treaty of the quantity of water being diverted and the published report of the Sanitary Board is not shown, and for all the record shows, they may have been representing a use not exceeding the 250,000 cubic feet before 1909, when the Treaty was negotiated; and indeed reference to any

well authenticated statistics will show that prior to 1910, the average withdrawal was about 4,000 feet; since the treaty, the amount has been greatly increased so as to reach not less than 8,000 feet, probably as much as 10,000. In the "Warren Report," of August 30, 1919, "Diversion of Water from the Great Lakes and Niagara River," page 176, these figures are given, on the authority of the Engineer of the Sanitary District:

1908—4421 feet
1909—2766 feet
1910—3458 feet
1913—7191 feet
1914—7105 feet
1915—6971 feet
1916—7325 feet
1917—7786 feet.

CURRENT IN CHICAGO RIVER.

There is some engineering testimony descriptive of the Chicago River and improvements alleged to have been made by the Sanitary District of the City of Chicago or by the Government. But a dangerous current has been created and operates as a serious detriment of even that local port and to the navigation interests by the interference of the Sanitary District, as shown by the testimony of Livingstone (Vol. I. p. 419); Emersen (Vol. V, p. 3021); Jaenke (Vol. V, p. 3022); Minskey (Vol. V, p. 3023); Green (Vol. V, p. 3029); Hamilton (Vol. V, p. 3031) and Simons (Vol. V, p. 3033), whose cross examinations follow beginning Volume V, p. 3034. This is well summed up by Mr. Sullivan, set out in Volume VI, p. 3616, as follows:

> "I would like to add a word as a vessel owner and a man operating steamers in the City of Chi-

cago. The local situation there is something extremely critical. Under the present flow of 4,000 cubic feet,—we presume it is 4,000 feet a second—navigation in the River is carried on at great hazard. The center pier structures and the swift current make it extremely dangerous and we have suffered loss of property and loss of life in consequence of these hazardous conditions. So far as any increase of the current goes, I should say it would mean disaster, and I am sure that so far as our ships are concerned we would not be able to operate them in the Chicago River. I do not want to appear as antagonistic to the Sanitary District, only in respect of the increasing of the flow so that it will make it impossible for us to navigate our boats. * * *

The current in the river in the Chicago River at present is extremely detrimental to the safe handling of boats, and any increase in the velocity of the current would mean disaster. It would simply close Chicago as a port against any of the so called modern ships, and to a large number of the vessels of an extremely smaller size."

This is based on conditions when the Sanitary District used, as Mr. Sullivan says, a flow of 4,000 feet, or practically the limit imposed by the Secretary of War in his conditional permit, since which time it is found and conceded that the flow is double or more; always the average is spoken of, but it is not a steady flow of the exact number of feet per second.

SUMMARY.

It is not our office and it is not our intention to go with any fullness into the questions, particularly the legal ones, necessarily to be argued by other counsel in the case, or do more than call to the attention of the

Court some of the points and some of the leading cases supporting, all which will be fully presented and argued by the other counsel in briefs and before the Court.

I.

The Great Lakes (Including Lake Michigan) and Connecting Rivers, Constitute a Great National and International Navigable Waterway.

The character and extent of the commerce carried on the Great Lakes is fully shown in the Record, both from the testimony of witnesses and also from Government reports. Mention might be made of the testimony of Ernst (Vol. 1, p. 62), Livingstone, (Vol. I, pp. 200, 398), Coulby, (Vol. I, p. 428), not to name many others. Then by way of official reports and documents, there are many (See Vol. IV, pp. 2406, 2420; Vol. VIII, p. 53); all of these show the enormous volume of the traffic which in a single season of navigation (8 months) has exceeded one hundred million tons. The port of Duluth-Superior, in point of water traffic handled, is the greatest in the world, and the Detroit River the most used navigable channel in the world. This Court has repeatedly taken notice of the amount and character of commerce on these inland seas. Three cases have already been mentioned:

The Genessee Chief, 12 How. 443, at 453;

Moore vs. American Transportation Co., 24 How. 1, at 38;

Illinois Central Railroad Co. vs. Illinois, 146 U. S. 387, at 436.

II.

The Abstraction of Water at Chicago Lowers Lake Levels.

While proof of this self evident fact is not necessary, such proof fully appears throughout the record; as for example, in the testimony of Noble, (Vol. I, p. 9), Haskell, (Vol. I, p. 35), Wilson, (Vol. I, p. 50).

The two District Judges found from the testimony that the abstraction of water did lower lake levels (Vol. VIII, pp. 129, 150). This was also the finding of Secretary of War Stimson after the full hearing before him, (Vol. VIII, p. 52), and it also appears from reports of the various Engineers, e. g., tabulated statement (Vol. IV, p. 2419). It may be taken as established that the abstraction of 10,000 cubic feet lowers the water of Lakes Michigan, Huron and Erie, as well as the rivers between Lakes Huron and Erie, where every inch is greatly needed, between 5 and 6 inches, and that the effect in the St. Lawrence River is even greater.

III.

The Lowering of Water Reduces Size of Cargoes.

It is shown by the testimony, particularly that of Haskell, (Vol. I, p. 30), Livingstone (Vol. I, pp. 200, 398) and Coulby (Vol. I, p. 428), that the large boats load to the limit allowed by the depth of the channels, particularly the shallow channels between Lakes Huron and Erie, and that one inch of water means from 75 to 100 tons of cargo, and this is confirmed by Reports of the Engineers. This lowering of navigable waters surely constitutes an interference with commerce and navigation.

IV.

The Right of Navigation is Paramount.

Many cases might be cited on this; see *United States vs. Chandler-Dunbar Company,* 229 U. S. 53, where in the syllabus this language is used:

> "Every structure in the water of a navigable river is subordinate to the right of navigation, and must be removed, even if the owner sustain a loss thereby, if Congress, in assertion of its power over navigation, so determines."

Cummings vs. Chicago, 188 U. S. 410, 427;
Greenleaf Johnson Lumber Co. vs. Garrison, Secretary of War, 237 U. S. 251;
Willink vs. United States, 240 U. S. 572.

V.

The Authority of the National Government Overrides That of the States in Respect to Navigable Waters.

It is sufficient to quote from *United States vs. Rio Grande Irrigation Company,* 174 U. S. 690, at page 703, where Mr. Justice Brewer uses this language:

> "Jurisdiction of the general Government over Interstate commerce and its natural highways vests in that Government the right to take all needed measures to preserve the navigability of the navigable water courses of the country, even against any state action."

In *Cummings vs. Chicago,* 188 U. S., 410, at page 428, this is said to control of navigation:

> "If the power of the state and that of the Federal Government come in conflict, the latter must control and the former yield."

VI.

The Rivers and Harbors Acts of September 19, 1890, and of March 3, 1899, are Valid and Effective.

Whatever might have been argued when the Sanitary District commenced operations under the enabling act of the State of Illinois of May 29, 1889, since the decision by this Court in *Union Bridge Company vs. United States,* 204 U. S. 364, February, 1907, it must be considered settled that the Federal Government has supreme control of navigable waters and that Congress may delegate to the Secretary of War the power and authority to grant or to refuse applications of States, corporations or individuals, either to create obstructions such as bridges or piers, or "to alter or modify the course, location, condition or capacity of any port, roadstead, haven, harbor, canal, lake, harbor of refuge," etc.

Union Bridge Company vs. United States has been uniformly followed in subsequent decisions of this Court, such as *Greenleaf Johnson Lumber Company vs. Garrison, Secretary of War,* 237 U. S., 251, where in the syllabus there are the following very pertinent paragraphs:

> "The power of the sovereign State or Nation is perpetual—not exhausted by one exercise—and all privileges granted in public waters are subject to that power; the exercise of which is not a taking of private property for public use but the lawful exercise of a governmental power for the common good.
>
> When one acting under state authority erects anything in navigable waters he does so with full knowledge of the paramount authority of Congress to regulate commerce among the States and subject to the exercise of such authority at some future time by Congress.

The power of the States over navigable waters is subordinate to that of Congress and the State can grant no right to the soil of the bed of navigable waters which is not subject to Federal regulation."

VII.

Estoppel, Even if there Were Facts to Warrant Such as to a Private Individual, Cannot Operate Against the Government.

The most the Sanitary District ever secured from the United States was a revocable, conditional permit, limited to 250,000 feet per second, and the Record shows unequivocally that the various Secretaries of War (including Taft, Stimson and Baker) have persistently refused to enlarge the grant or to acquiesce in larger withdrawal.

Morris vs. United States, 174 U. S. 196, 282;
Union Bridge Company vs. United States, 204 U. S. 364.

VIII.

The Action Was Properly Brought in the Court Below.

While in the court below it appears that no question was raised as to the jurisdiction of that court, Judge Carpenter saying in his opinion (Vol. VIII, p. 129):

"The jurisdiction of the court has not and could not be challenged,"

some claim is now being made that the action was improperly brought, and that the court had no jurisdiction to entertain the complaint of the United States. The

language of the Rivers and Harbors Acts is sufficient grant of authority for the Attorney General to institute the action; but if that were not so, the United States, without any such statute, would have full power to invoke the aid of the courts in stopping irreparable damage to commerce and navigation.

Cotton vs. United States, 11 How. 229;
United States vs. Cook, 19 Wall. 594;
United States vs. Rio Grande Dam and Irrigation Company, 174 U. S. 690.

IX.

As Concededly the Sanitary District Is Withdrawing Water Greatly in Excess of the Permit, the Injunction Should Be Affirmed.

The Sanitary District applied for and received a permit from the United States Government to take from Lake Michigan water not exceeding in volume 4,167 cubic feet per second. It has made repeated applications to have the amount increased, but has met with refusal from every succeeding Secretary of War. Without the necessary permits, the Sanitary District has gone forward and defiantly taken all the water that it has thought it needed, up to 10,000 cubic feet per second, and now boldly takes the position that as a matter of right it is entitled to take all that it desires, without authority from the Federal Government and without any permit; and in pleadings as well as in testimony and in argument, denies the authority of the United States to regulate or stop the abstraction of water from Lake Michigan and the Great Lakes system. If the constitutionality and effectiveness of the Rivers and Harbors Acts are con-

ceded, as they must be in view of the repeated decisions by this Court, and the jurisdiction of the Court is established, there can be but one decision, and that is the affirmance of the judgment of the District Court.

Respectfully submitted,

HARVEY D. GOULDER,
Counsel for Lake Carriers' Association,
as *Amicus Curiae.*

SANITARY DISTRICT OF CHICAGO *v.* UNITED STATES.

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE NORTHERN DISTRICT OF ILLINOIS.

No. 161. Argued December 8, 9, 1924.—Decided January 5, 1925.

1. A suit to enjoin an agency of the State of Illinois from continuing diversions of water from Lake Michigan which lower that lake and threaten the like effect upon other lakes and connecting waters of the Great Lake System, including the St. Lawrence, is maintainable by the United States not only to remove obstruction to interstate and foreign commerce, but also to carry out treaty obligations to a foreign power. (Treaty of January 11, 1909, with Great Britain, 36 Stat. 2448.) P. 425.
2. *Semble* that such a suit might also stand upon an ultimate sovereign interest in the Lakes. *Id.*
3. The suit may be brought by the Attorney General, in virtue of his office, and it need not be authorized by a statute. P. 426.
4. The power of the United States to remove obstructions to interstate and foreign commerce is superior to that of the States to provide for the welfare or necessities of their inhabitants. *Id.*
5. Touching interstate and foreign commerce, in so far as the States may act Congress can override what they have done; but, in matters of imminent and direct national importance, they may not act at all, even where Congress has been silent. *Id.*

6. Irrespective of any international compact, a State cannot authorize diversions of water from the Great Lakes which will affect their level, without the consent of Congress. P. 426.
7. Even if it were possible for the United States to estop itself by grant or contract from exercising its power in matters of national and international concern, its act must be strictly construed against such a result. P. 427.
8. The Act of March 2, 1827, granting land to Illinois to open a canal uniting the waters of the Illinois River with those of Lake Michigan vested no irrevocable discretion in the State with regard to the amount of water to be withdrawn from the Lake. *Id.*
9. The withdrawal of water in this case, except in so far as it may be authorized by the Secretary of War, is prohibited by the Act of March 3, 1899, c. 425, § 10, 30 Stat 1151, as involving a change in the condition of the Lakes and the Chicago River (admitted to be navigable) and an obstruction to their navigable capacity. P. 428.
10. Revocable licenses granted by the Secretary of War under the above Act of 1899, concerning the appellant's canal and the quantity of water to be taken from Lake Michigan,—considered and *held* no justification for the excessive diversions here complained of by the Government. P. 429.
11. Refusal of the Secretary of War to license greater withdrawals of water from Lake Michigan by the appellant through its canal, for the sanitation of Chicago, did not infringe any rights of that City arising from its investment in the canal property, or of States bordering on the Mississippi based on their interest in increasing the artificial flow; nor were those states or the city, entitled to be heard before the license was refused. P. 431.

Affirmed.

APPEAL from a decree of the District Court enjoining the appellant from diverting water from Lake Michigan in excess of 250,000 cubic feet per minute, the amount authorized by the Secretary of War.

Mr. Edmund D. Adcock, with whom *Mr. Clyde L. Day*, *Mr. George F. Barrett* and *Mr. Louis J. Behan* were on the briefs, for appellant.

I. Appellant was organized under an act of Illinois passed in the exercise of the State's police power. This

act fixed appellant's powers and duties, and specified the required diversion of water from Lake Michigan. *Wilson* v. *Board of Trustees*, 133 Ill. 443, 465; *People* v. *Nelson*, 133 Ill. 565, 580, 582, 592, 594; *Beidler* v. *Sanitary District*, 211 Ill. 628, 638; *Pittsburg, etc. Ry. Co.* v. *Sanitary District*, 218 Ill. 286, 287, 295; *United States* v. *Bellingham Bay Co.*, 176 U. S. 211.

The diversion of water to operate the Canal has been authorized by the Act of Congress of March 2, 1827. *Missouri* v. *Illinois*, 200 U. S. 496, 519, 526; *Mortell* v. *Clark*, 272 Ill. 201, 213; Messages and Papers of the Presidents, vol. 5, p. 3334.

Appellee, through its engineer officers and the Secretary of War, observed the action of the State of Illinois and appellant pursuant to its authority in planning and constructing the diversion works. The Secretary consented to the work necessary to accomplish the diversion and authorized the opening of the main channel of the district. He construed the Act of March 2, 1827, *supra*, and the laws of Illinois, as affirmatively authorizing the diversion.

The Secretary, charged with the duty of enforcing the Rivers and Harbors Acts of 1890 and 1899, has thus construed a diversion to the capacity of appellant's canal, to have been "affirmatively authorized by law" and "affirmatively authorized by Congress." These acts of the Secretary should have the force of judicial interpretation.

II. The permits of the Secretary of July 11, 1900, authorizing the work of deepening and widening the channels of the Chicago River to provide for the diversion or abstraction from Lake Michigan through them of the amount of water required by the state law according to the population of appellant, constituted all the authority required by appellant from appellee, to divert said waters. *Maine Water Co.* v. *Knickerbocker Co.*, 99 Me. 473;

Rivers and Harbors Act of 1890, §§ 7 and 10; Rivers and Harbors Act of 1899, §§ 9, 10 and 12.

The altering or modifying of the navigable capacity of the waters affected was thus authorized and is lawful. *Cummings* v. *Chicago*, 188 U. S. 410; *Hubbard* v. *Fort*, 188 Fed. 987; *Maine Water Co.* v. *Knickerbocker Co.*, *supra*; *Hudson County Water Co.* v. *McCarter*, 209 U. S. 349.

III. The Secretary of War has authorized the opening of the canal, its operation and attendant diversion of water, by the permit of May 8, 1899, every condition of which has been fulfilled, assuming such conditions to be valid. See *Monongahela Bridge Co.* v. *United States*, 216 U. S. 177, 195; *Philadelphia Co.* v. *Stimson*, 223 U. S. 605; *Kwock Jan Fat* v. *White*, 253 U. S. 454, 464.

The Attorney General, under the Act of March 3, 1899, is only authorized to institute suits for the removal of structures. The District Court was without jurisdiction to entertain this suit. Act of March 3, 1899, § 12; *Ogden City* v. *Boreman*, 20 Utah, 98; Endlich, Interp. of Stats., § 51; Sutherland Stat. Constr., § 140; *United States* v. *Rio Grande Co.*, 174 U. S. 690.

The Secretary of War is only authorized to grant or refuse a permit. He has no power to regulate the diversion.

IV. The Illinois Act of May 29, 1889, was sufficient legislative authority for appellant's diversion works and for the diversion of water required by them. *Cummings* v. *Chicago*, 188 U. S. 410, 427, 428, 430; *Montgomery* v. *Portland*, 190 U. S. 89, 107; *Corrigan Transit Co.* v. *Sanitary District*, 137 Fed. 851, 856; *Canada Atlantic Transit Co.* v. *Chicago*, 210 Fed. 7, 10, 11; *Laurel Hill Cemetery* v. *San Francisco*, 216 U. S. 358; *Escanaba Co.* v. *Chicago*, 107 U. S. 678; *Lake Shore, etc. Ry. Co.* v. *Ohio*, 165 U. S. 365; *Cardwell* v. *American Bridge Co.*, 113 U. S. 205; *Huse* v. *Glover*, 119 U. S. 543; *Willamette Bridge Co.* v. *Hatch*, 125 U. S. 1.

The creation of appellant's canal and its other diversion works, was "authorized by law" under the Rivers and Harbors Act of 1890. *United States* v. *Bellingham Bay Co.*, 176 U. S. 211.

The diversion is lawful under the police power without the express consent of the Secretary of War. Any other construction of the Act of March 3, 1899, would tend to nullify appellant's acts in the interest of public health, which cannot be where the congressional intention is not expressed in plain and unmistakable terms. *Columbus* v. *Mercantile Trust Co.*, 218 U. S. 645, 658; *Missouri* v. *Kansas Gas Co.*, 265 U. S. 298; *Public Utilities Comm.* v. *Landon*, 249 U. S. 236; *Pennsylvania Gas Co.* v. *Public Serv. Comm.*, 252 U. S. 23; *Texas* v. *White*, 7 Wall. 700, 725; *New York* v. *Miln*, 11 Pet. 102, 139; *Minnesota Rate Cases*, 230 U. S. 352, 402; *Lake Shore, etc. Ry. Co.* v. *Ohio*, 173 U. S. 285; *Hennington* v. *Georgia*, 163 U. S. 299, 317; *Crossman* v. *Lurman*, 192 U. S. 189; *Plumley* v. *Massachusetts*, 155 U. S. 461; *In re Rahrer*, 140 U. S. 545, 554; *Mutual Loan Co.* v. *Martell*, 222 U. S. 225, 233; *Cummings* v. *Chicago*, 188 U. S. 410, 430; *Savage* v. *Jones*, 225 U. S. 501; *Missouri Kans. & Tex. Ry. Co.* v. *Haber*, 169 U. S. 613, 623; *Reid* v. *Colorado*, 187 U. S. 137, 148; *Sinnot* v. *Davenport*, 22 How. 227, 243; *Missouri Pac. Ry. Co.* v. *Larabee Flour Mills Co.*, 211 U. S. 612, 623; *Missouri Kans. & Tex. Ry. Co.* v. *Harris*, 234 U. S. 412, 418; *Carey* v. *South Dakota*, 250 U. S. 118, 122; *Houston, etc. Ry. Co.* v. *United States*, 234 U. S. 342; *Illinois Cent. R. R. Co.* v. *Public Utilities Comm.*, 245 U. S. 493, 510; *Sligh* v. *Kirkwood*, 237 U. S. 52, 60; *Hammer* v. *Dagenhart*, 247 U. S. 251, 273, 275, 276; *Child Labor Tax Case*, 259 U. S. 20, 37.

Congress has otherwise by legislation indicated that it was not its intention to prohibit the operation of appellant's diversion works, or that any act of any of its officers should have that effect. *United States* v.

Chandler-Dunbar Co., 229 U. S. 53; *International Bridge Co.* v. *New York*, 254 U. S. 126, 131; *West Chicago Street R. R. Co.* v. *Chicago*, 201 U. S. 506, 527.

V. Appellee has invited and acquiesced in the construction of the canal to divert the water.

It is estopped now to deny the right. *Missouri* v. *Illinois*, 200 U. S. 496, 526; *United States* v. *Pennsylvania Dock Co.*, 272 Fed. 839, 848; *United States* v. *Osage County*, 254 Fed. 570, 573; *United States* v. *Debell*, 227 Fed. 775, 779; *United States* v. *Midway Oil Co.*, 232 Fed. 619, 631; *United States* v. *Chandler-Dunbar Co.*, 152 Fed. 41, 81; *Monongahela Nav. Co.* v. *United States*, 148 U. S. 312, 334; *Hemmer* v. *United States*, 204 Fed. 898, 901; *Iowa* v. *Carr*, 191 Fed. 257, 266.

As for the treaty between the United States and Great Britain of January 11, 1909, relating to Canadian boundary waters,—when the treaty was made, the right to divert this water by appellant and the State of Illinois was recognized. That right was not in any respect curbed. The treaty expressly eliminates from its terms by the preliminary article, Lake Michigan. Lake Michigan is not a boundary water, as defined by the treaty.

Article II of the treaty reserves to each of the parties, or to the state governments, or provincial governments, as the case may be, all rights over these nonboundary waters. And again, in Art. III, it is stated: ". . . . nor are such provisions intended to interfere with the ordinary use of such waters for domestic and sanitary purposes." Article VIII expressly provides that the uses for domestic and sanitary purposes shall be paramount.

The treaty thus completely protects the diversion at Chicago. There was no dispute between the United States and the Dominion of Canada as to the right to divert 10,000 cubic seconds feet of water from Lake Michigan at Chicago. The International Waterways Commission, which was composed of representatives of the two

governments, settled that. Its two reports of May 3, 1906, and January 4, 1907, were signed by all the members of the Commission—three from the United States and three from Canada. As to the diversion at Chicago, the only question remaining unsettled was whether there should be diverted more than 10,000 cubic seconds feet of water.

Article II thus left unhampered the power of the sovereign over the waters that were not boundary waters within the sovereign's territory, subject only—(1) to the right of the citizens of one country to sue in the courts of the other country for damages caused by a diversion not then existing; (2) to the right merely of either party to object to further diversions than those which existed, to the injury of navigation. The Chicago diversion to the amount of 10,000 seconds feet was found by the International Waterways Commission to be an existing diversion. The right of the sovereign having jurisdiction over Lake Michigan, a nonboundary water, subject to the conditions mentioned, was thus reserved. As to those waters, the sovereign could do anything with them it chose. *The Exchange*, 7 Cr. 116, 136. See also opinion of Judson Harmon on right of United States in the Rio Grande, 21 Ops. Atty. Gen. 274, 280.

The waters which are diverted from Lake Michigan at Chicago are wholly within the limits of the State of Illinois.

The treaty is the law of the land, and may properly be said to have been made, so far as the Chicago diversion is concerned, for the benefit of the State of Illinois and the appellant. The State or the appellant may compel the recognition of such contract right. The treaty reserved the right of the sovereign—and the State is a complete sovereign except as to those things delegated to the Federal Government—over these waters. At least the United States, by making the treaty, must be

construed to have acquiesced and consented to the diversions as they existed at the time, unless some definite action were taken by Congress indicating a different intention.

VI. No witness was produced by appellee to testify that lowering of the lake surfaces, or damage to commerce, was ever actually observed. Appellee's case depends entirely upon an inference of the unseen and the subtle analyses of expert witnesses, which cannot form the basis of an injunctional decree. *Missouri* v. *Illinois*, 200 U. S. 496, 523; Joyce on Nuisances, 1906, ed., §§ 299 420; *Salvin* v. *North Brancepeth Coal Co.* L. R. 9, Ch. App. 705, 709; *North Dakota* v. *Minnesota*, 263 U. S. 365.

The injunction should not have been entered unless the injury and damage to commerce was material and the obstruction to navigation was unreasonable. *United States* v. *Rio Grande Co.*, 174 U. S. 690, 709; *Corrigan Transit Co.* v. *Sanitary District*, 137 Fed. 851, 857; *Lake Shore etc. Ry. Co.* v. *Ohio*, 173 U. S. 285, 294; *Cummings* v. *Chicago*, 188 U. S. 410, 428; *Union Bridge Co.* v. *United States*, 204 U. S. 364, 365, 385, 400.

It must appear, in a case of this character, that an unreasonable obstruction and damage to commerce clearly exist. *New York* v. *New Jersey*, 256 U. S. 296, 309; *Kansas* v. *Colorado*, 206 U. S. 46, 117; *Attorney General* v. *Mayor*, 13 Weekly Reporter, 1863–1865, 888; *Mississippi, etc. R. R. Co.* v. *Ward*, 2 Black, 485, 495; 2 Story, Com. on Eq., 203, 204.

VII. If it appear that the granting of an injunction would cause comparatively greater injury to the defendant than benefit to the complainant, a court of equity will not hesitate to deny the relief. 1 Joyce on Injunctions, § § 20, 25; *Kansas* v. *Colorado*, 206 U. S. 46, 117; *Georgia* v. *Tennessee Copper Co.*, 206 U. S. 230, 237; *Dun* v. *Lumbermen's Credit Assn.*, 209 U. S. 20;

McCarthy v. *Bunker Hill Co.*, 164 Fed. 927; *New York* v. *Pine*, 185 U. S. 93.

VIII. The statute does not authorize the Secretary to make any findings or conclusions. If it did, they would be subject to review. *Philadelphia Co.* v. *Stimson*, 223 U. S. 605, 620; *Hardin* v. *Jordan*, 140 U. S. 371; *Rosenberger* v. *Harris*, 136 Fed. 1001, 1002; *United States* v. *United Verde Copper Co.*, 196 U. S. 207, 215; *School of Magnetic Healing* v. *McAnnulty*, 187 U. S. 94, 110.

In any event, Secretary Stimson's findings and conclusions were erroneous. *Corrigan Transit Co.* v. *Sanitary District*, 137 Fed. 851, 855; *Mortell* v. *Clark*, 272 Ill. 201; *United States* v. *Rio Grande Co.*, 174 U. S. 690.

IX. The lower court should have granted the motion that the appellant be enjoined from taking in excess of 10,000 cubic seconds feet of water from Lake Michigan on condition that appellant pay the cost of constructing such compensating or regulating works as the United States should provide to be built to offset for the claimed lowering of the lake surfaces and their connecting channels due to 10,000 seconds feet diversion at Chicago. Admitting, for the sake of argument, only, all contentions of appellee to be true, appellant cannot be enjoined from taking an amount of water materially less than 10,000 cubic seconds feet, until appellant and cities and towns within its limits can, if at all, readjust their works of sewage disposal and of purification of water supply to suit the changed conditions.

The decree absolutely enjoined appellant from withdrawing from Lake Michigan in excess of 4,167 seconds feet. The Secretary of War would be powerless under it to authorize any further diversion.

This matter should be settled by Congress. *New York* v. *New Jersey*, 256 U. S. 296, 313; *Virginia* v. *West Virginia*, 246 U. S. 565; Amer. Bar Assn. Journal, February, 1922.

Mr. Daniel N. Kirby, with whom *Mr. Edward J. Brundage*, Attorney General of Illinois, *Mr. Jesse W. Barrett*, Attorney General of Missouri, *Mr. J. Frank Thompson*, Attorney General of Tennessee, *Mr. Percy Saint*, Attorney General of Louisiana, and *Mr. Cornelius Lynde* were on the brief, for the States of Illinois, Missouri, Tennessee and Louisiana, the Chamber of Commerce of St. Louis, the Memphis Chamber of Commerce, the New Orleans Board of Trade, the New Orleans Association of Commerce, the Mississippi Valley Association, and the Chicago Association of Commerce, as *amici curiae*, by special leave of Court.

Mr. Solicitor General Beck and *Mr. Joseph B. Fleming*, Special Assistant to the Attorney General, with whom *Mr. Attorney General Stone* and *Mr. Louis B. Caldwell*, Special Assistant to the Attorney General, were on the brief, for the United States.

I. The Great Lakes, their connecting waters, and the St. Lawrence River, are navigable waters of the United States (*The Genesee Chief*, 12 How. 443; *United States* v. *Rodgers*, 150 U. S. 249; *Illinois Cent. R. R. Co.* v. *Illinois*, 146 U. S. 387,) and also "international waters, being dedicated in perpetuity to the common navigation of all the inhabitants" of the countries on both sides of the boundary, I Moore, Int. Law Dig., p. 675; I Hyde, Int. Law, 1922, pp. 320, 321; *The Genesee Chief*, 12 How. 443; *Moore* v. *American Transp. Co.*, 24 How. 1, 37, 38; *United States* v. *Rodgers*, 150 U. S. 249, 258; *United States* v. *Chandler-Dunbar Co.*, 229 U. S. 53.

Their international character is confirmed by the Boundary Waters Treaty of January 11, 1909. Lake Michigan is likewise given an international character by the covenant in Art. I, that the free and open navigation provided for with respect to the boundary waters "shall extend to the waters of Lake Michigan."

II. The level of the Great Lakes and the diversion of water from the St. Lawrence River basin to the Mississippi basin are both subjects of commerce regulation, national (and also international) in character, such as to require exclusive control by Congress. Independently, therefore, of any assertion of control by Congress, the Illinois Act of 1889, in so far as it authorized and directed the appellant to do the acts here complained of without authorization of Congress, was void.

Appellant reiterates that its acts were "affirmatively authorized by law" within the meaning of § 10 of the Act of September 19, 1890; but the Act of March 3, 1899, was enacted nearly a year before the appellant (under the permit of May 8, 1899) accomplished a connection between its channel and the Chicago River and thereby diverted water from Lake Michigan. The basis for this contention, however, is a misapplication of the decision in *United States* v. *Bellingham Bay Co.*, 176 U. S. 211,—which held that in the case of an obstruction of a navigable stream confined wholly within the boundaries of a State, the words "affirmatively authorized by law" in the Act of 1890 included lawful authorization by an act of the state legislature. Manifestly, an obstruction of a navigable water like Lake Michigan or the Ohio and Mississippi Rivers could not lawfully be authorized by legislation of a single State either before or after the enactment of the Act of 1890.

It makes no difference whether interference with that control proceeds from a state statute or from the acts of individuals. *Kansas City So. Ry. Co.* v. *Kaw Valley District*, 233 U. S. 75, 78.

Those subjects of interstate commerce which require a general system or uniformity of regulation are national in character, and as to such the power of Congress is exclusive; those admitting of diversity of treatment according to local conditions are local in character, and as to

such the States may act within their respective jurisdictions until Congress sees fit to act. *Minnesota Rate Cases*, 230 U. S. 352; *Covington Bridge Co.* v. *Kentucky*, 154 U. S. 204; *Wilmington Transp. Co.* v. *Railroad Commission*, 236 U. S. 151.

Until Congress asserted its paramount control, the subject of obstructions to the navigable capacity of state navigable waters, not affecting navigable waters without the State, was deemed to be local in character and subject to the authority of the State. See, (1), cases involving dams across state navigable waters; *Willson* v. *Black-bird Creek Co.*, 2 Pet. 245; *Pound* v. *Turck*, 95 U. S. 459; *Huse* v. *Glover*, 119 U. S. 543; and *Monongahela Nav. Co.* v. *United States*, 148 U. S. 312; (2), cases involving bridges across state navigable waters; *Gilman* v. *Philadelphia*, 3 Wall. 713; *Escanaba Co.* v. *Chicago*, 107 U. S. 683; *Cardwell* v. *American Bridge Co.*, 113 U. S. 205; *Hamilton* v. *Vicksburg, etc. R. R.*, 119 U. S. 280; *Willamette Bridge Co.* v. *Hatch*, 125 U. S. 1; and *Lake Shore, etc. Ry. Co.* v. *Ohio*, 165 U. S. 365; (3), cases involving improvement of state navigable waters; *Withers* v. *Buckley*, 20 How. 84; *Sands* v. *Manistee Co.*, 123 U. S. 288. See *Huse* v. *Glover*, 119 U. S. 543.

The power of the States with respect to interstate navigable waters has at all times been limited to matters purely local in character, incidental to and aiding commerce, and not affecting navigation elsewhere. The cases fall into four fairly well-defined classes: (1), the regulation of pilotage, *Cooley* v. *Board of Wardens*, 12 How. 299; (2), protection of coasts and improvement of harbors, bays, and streams, *Mobile County* v. *Kimball*, 102 U. S. 691; (3), quarantine and inspection laws and the policing of harbors, *Morgan's S. S. Co.* v. *Louisiana Board of Health*, 118 U. S. 455; (4), regulation of wharves, piers, and docks, *Transportation Co.* v. *Parkersburg*, 107 U. S. 691.

Obstructions to the navigable capacity of interstate waters without authority from Congress have always been held unlawful, *Pennsylvania* v. *Wheeling Bridge Co.*, 13 How. 518; *Bridge Co.* v. *United States*, 105 U. S. 470; *Miller* v. *Mayor of New York*, 109 U. S. 385; *Covington Bridge Co.* v. *Kentucky*, 154 U. S. 204; *Kansas City So. Ry. Co.* v. *Kaw Valley District*, 233 U. S. 75; *Gibbons* v. *Ogden*, 9 Wheat. 190; *Brown* v. *Maryland*, 12 Wheat. 419; *Henderson* v. *Mayor of New York*, 92 U. S. 259; *Hall* v. *DeCuir*, 95 U. S. 485; *Lord* v. *Steamship Co.*, 102 U. S. 541; *Gloucester Ferry Co.* v. *Pennsylvania*, 114 U. S. 196; *Philadelphia Co.* v. *Pennsylvania*, 122 U. S. 326; *Sault Ste. Marie* v. *International Transit Co.*, 234 U. S. 333.

The subject of the levels of the Great Lakes does not permit of diversity of treatment according to the local requirements of cities on their shores. What Chicago can do, so can Milwaukee, Toledo, and Cleveland. *Pennsylvania* v. *West Virginia*, 262 U. S. 553, 596.

Under the compact contained in Art. IV of the Ordinance of 1787, Illinois may not interfere with or decrease the navigable capacity of Lake Michigan or any of the other Great Lakes. *Economy Light Co.* v. *United States*, 256 U. S. 113, 118; *Pennsylvania* v. *Wheeling Bridge Co.*, 13 How. 518.

On the other hand, in such cases as *Escanaba Co.* v. *Chicago*, 107 U. S. 678; *Cardwell* v. *American Bridge Co.*, 113 U. S. 205; *Huse* v. *Glover*, 119 U. S. 543; *Hamilton* v. *Vicksburg, etc. R. R.*, 119 U. S. 280; *Sands* v. *Manistee Co.*, 123 U. S. 288; and *Willamette Bridge Co.* v. *Hatch*, 125 U. S. 1, this Court held the compact inapplicable to obstructions over navigable waters entirely within the boundaries of a single State.

The principle to be extracted from these cases is that where the obstruction or restriction of navigability is that of a state navigable water, the compact does not

apply; where it is of an interstate navigable water such as the Ohio River or the Great Lakes, the compact is, and has always been in force.

The subject of the levels of and diversion of waters from the Great Lakes is necessarily national because international in character, and therefore for the exclusive control of Congress. *United States* v. *Chandler-Dunbar Co.*, 229 U. S. 53; *Lord* v. *Steamship Co.*, 102 U. S. 541, 544; *Henderson* v. *Mayor of New York*, 92 U. S. 259; I Hyde, Int. Law, pp. 313–316.

III. The purposes for which the States might formerly exercise their limited power all came within the scope of the police power. In some cases it was for the protection of public health, *Willson* v. *Black-bird Creek Marsh Co.*, 2 Pet. 245; *Morgan's S. S. Co.* v. *Louisiana Board of Health*, 118 U. S. 455; in some for furthering of commerce, *Pound* v. *Turck*, 95 U. S. 459; in some for improvement of rivers or harbors, *Mobile County* v. *Kimball*, 102 U. S. 691; *Sands* v. *Manistee Co.*, 123 U. S. 288; in some for public convenience and commerce, as a bridge, *Gilman* v. *Philadelphia*, 3 Wall. 724; *Escanaba Co.* v. *Chicago*, 107 U. S. 683.

By the Acts of 1890 and 1899 Congress made an effectual assertion of its paramount control over all navigable waters of the United States and assumed jurisdiction of the subjects mentioned above. *United States* v. *Rio Grande Co.*, 174 U. S. 690. See also *Lake Shore, etc. Ry. Co.* v. *Ohio*, 165 U. S. 365; *United States* v. *Bellingham Bay Co.*, 176 U. S. 211; *Cummings* v. *Chicago*, 188 U. S. 410; *Union Bridge Co.* v. *United States*, 204 U. S. 364; *Philadelphia Co.* v. *Stimson*, 223 U. S. 605; *United States* v. *Chandler-Dunbar Co.*, 229 U. S. 53; *Economy Light Co.* v. *United States*, 256 U. S. 113; *Southern Pac. Co.* v. *Olympian Co.*, 260 U. S. 205.

There has been no undue delegation of power to the Secretary of War. *Union Bridge Co.* v. *United States*,

204 U. S. 364; *Philadelphia Co.* v. *Stimson*, 223 U. S. 635.

The effect of § 10 of the Act of 1899 is to make the creation of such obstructions or modifications dependent "upon the concurrent or joint assent of both the national government and the state government." *Cummings* v. *Chicago*, 188 U. S. 410; *Montgomery* v. *Portland*, 190 U. S. 89; *North Shore Boom Co.* v. *Nicomen Boom Co.*, 212 U. S. 406; *Port of Seattle* v. *Oregon & Washington R. R. Co.*, 255 U. S. 56; *International Bridge Co.* v. *New York*, 254 U. S. 126.

Under § 10 of the Act of 1899, an act of Congress is necessary to authorize the creation of an obstruction to the navigable capacity of a navigable water of the United States; for a modification of the condition, etc., of such navigable water, not amounting to an obstruction, the recommendation of the Chief of Engineers and the authorization of the Secretary of War are necessary. *Hubbard* v. *Fort*, 188 Fed. 987; *West Chicago Street R. R. Co.* v. *Chicago*, 201 U. S. 506. Distinguishing *Maine Water Co.* v. *Knickerbocker Co.*, 99 Me. 473.

Whether the entire navigable capacity, and whether the unmodified condition of a navigable water, should be conserved for the use and safety of navigation, are questions legislative in character, and their determination by Congress is conclusive. *United States* v. *Chandler-Dunbar Co.*, 229 U. S. 53, 62; *Southern Pac. Co.* v. *Olympian Co.*, 260 U. S. 205; *Monongahela Bridge Co.* v. *United States*, 216 U. S. 177; *Philadelphia Co.* v. *Stimson*, 223 U. S. 605, 635, 638. See also *Pennsylvania* v. *Wheeling Bridge Co.*, 18 How. 421; *Union Bridge Co.* v. *United States*, 204 U. S. 364; *Gibson* v. *United States*, 166 U. S. 269; *Scranton* v. *Wheeler*, 179 U. S. 141; *Chicago, B. & Q. Ry. Co.* v. *Drainage Commrs.*, 200 U. S. 561; *West Chicago Street R. R. Co.* v. *Chicago*, 201 U. S. 506; *Hannibal Bridge Co.* v. *United States*, 221 U. S. 194.

IV. Appellant has created and is maintaining an obstruction to the navigable capacity of navigable waters of the United States in violation of § 10 of the Act of Congress of March 3, 1899.

To constitute an obstruction, neither material injury and damage to commerce nor unreasonable obstruction to navigation are necessary. *Economy Light Co.* v. *United States*, 256 U. S. 113; *United States* v. *Chandler-Dunbar Co.*, 229 U. S. 53; *Pennsylvania* v. *Wheeling Bridge Co.*, 13 How. 553; *Hubbard* v. *Fort*, 188 Fed. 992. Distinguishing, *Union Bridge Co.* v. *United States*, 204 U. S. 364; *New York* v. *New Jersey*, 256 U. S. 296; *Kansas* v. *Colorado*, 206 U. S. 46; *Mississippi, etc. R. R. Co.* v. *Ward*, 2 Black, 485.

V. The obstructions have never been affirmatively authorized by Congress, as required by § 10 of the Act of March 3, 1899.

The authority in the Acts of March 30, 1822, and March 2, 1827, was for the construction of a particular canal, the location of which was to be determined by law, and for the purpose of navigation, not sanitation.

Sections 7 and 10 of the Act of September 19, 1890, and § 10 of the Act of March 3, 1899, made unlawful any greater diversion than was practiced in 1890. *United States* v. *Rio Grande Co.*, 174 U. S. 690.

The Niagara Falls Act of 1906 did not constitute such authorization; if anything, it forbade the unauthorized diversion.

The Canadian Boundary Waters Treaty of January 11, 1909, did not constitute such authorization; instead, it forbade any diversion over 4,167 cubic seconds feet.

VI. Appellant's diversion in excess of 4,167 cubic seconds feet has not been recommended by the Chief of Engineers nor authorized by the Secretary of War, as required by § 10 of the Act of March 3, 1899.

Appellant, having applied for and accepted the various permits, is estopped.

The Secretary of War may impose conditions on permits granted by him under § 10 of the Act of March 3, 1899, and may revoke or modify such permits on nonfulfillment of these conditions. *Southern Pac. Co.* v. *Olympian Co.*, 260 U. S. 205.

VII. Appellant's unauthorized diversion cannot be justified as an exercise of the police power.

On a subject of interstate commerce national in character and requiring exclusive control by Congress, there can be no reserved police power in the State to invade that control even for the protection of public health. *Henderson* v. *Mayor of New York*, 92 U. S. 259; *Kansas City So. Ry. Co.* v. *Kaw Valley District*, 233 U. S. 75.

On all other subjects of interstate commerce, when Congress has asserted its paramount control, there is no police power reserved in the State to invade it. *Morgan's S. S. Co.* v. *Louisiana Board of Health*, 118 U. S. 455, 464. See also *Compagnie Francaise* v. *Louisiana Board of Health*, 186 U. S. 380; *Louisiana* v. *Texas*, 176 U. S. 1, 19; *Mobile County* v. *Kimball*, 102 U. S. 691, 697–699; *Wisconsin* v. *Duluth*, 96 U. S. 379.

VIII. The right of appellee to an injunction is not barred by laches, acquiescence, or estoppel.

Section 12 of the Act of March 3, 1899, is sufficient authority for this suit. *Economy Light Co.* v. *United States*, 256 Fed. 792, 793; s. c. 256 U. S. 113.

Congress intended by the Act of March 3, 1899, to extend, not to limit, the scope of federal control over obstructions and modifications of the navigable capacity of navigable waters.

In the Act of 1890, § 10 provided that injunction proceedings might be instituted to enjoin obstructions. Section 12 of the Act of 1899 was intended to have a broader scope and to cover all structures in violation of §§ 9, 10, 11, whether the structures amounted to, or caused, obstructions, or were merely unlawful modifications of the

condition of a navigable water, not amounting to obstructions.

Independently of § 12, there is sufficient authority for the instant suit. *In re Debs*, 158 U. S. 564; *Pennsylvania* v. *Wheeling Bridge Co.*, 13 How. 518; *United States* v. *San Jacinto Tin Co.*, 125 U. S. 273; *United States* v. *American Bell Tel. Co.*, 128 U. S. 315; *Gilman* v. *Philadelphia*, 3 Wall. 713; *Louisiana* v. *Texas*, 176 U. S. 1, 19; *United States* v. *Trans-Missouri Freight Assn.*, 166 U. S. 290; *Missouri* v. *Illinois*, 180 U. S. 208, 236; *Northern Securities Co.* v. *United States*, 193 U. S. 197, 356.

The doctrine of comparative injury has no application. *Ruppert* v. *Caffey*, 251 U. S. 264; *In re Debs*, 158 U. S. 564, 582; 31 L. R. A. (N. S.) 881; *Union Bridge Co.* v. *United States*, 204 U. S. 401.

Under the terms of the Treaty of January 11, 1909, the construction of such compensating works as the appellant proposes cannot be undertaken without the approval of the International Joint Commission.

The decree which appellant proposes would be void and inoperative, in that it would contain a condition which the Court would be powerless to enforce. The construction of submerged weirs in the Niagara and St. Clair Rivers may never be authorized by Congress. Even if so authorized, they may never be permitted by the International Joint Commission. If authorized, they may cost many times what the appellant has in mind or is able to pay. *Kansas City So. Ry. Co.* v. *Kaw Valley District*, 233 U. S. 75, 77–78.

Mr. Andrew B. Dougherty, Attorney General of Michigan, for the States of Michigan, Indiana, Minnesota, New York, Ohio, Pennsylvania, and Wisconsin, as *amici curiae*, by special leave of Court. *Messrs. U. S. Lesh*, Attorney General of Indiana; *Henry S. Sweeny*, Assistant

Attorney General of Michigan; *Clifford L. Hilton*, Attorney General of Minnesota; *Carl Sherman*, Attorney General, and *Edward G. Griffin* and *C. S. Ferris*, Deputy Attorneys General, of New York; *C. C. Crabbe*, Attorney General of Ohio; *Geo. W. Woodruff*, Attorney General, and *Phillip Wells*, Deputy Attorney General, of Pennsylvania; and *Herman L. Ekern*, Attorney General of Wisconsin, were also on the brief.

Mr. Harvey D. Goulder for the Lake Carriers' Association as *amicus curiae*, by special leave of Court.

Mr. Francis X. Busch and *Mr. Leon Hornstein*, by leave of Court, filed a brief on behalf of the City of Chicago, as *amicus curiae*.

MR. JUSTICE HOLMES delivered the opinion of the Court.

This is a bill in equity brought by the United States to enjoin the Sanitary District of Chicago, a corporation of Illinois, from diverting water from Lake Michigan in excess of 250,000 cubic feet per minute; the withdrawal of that amount having been authorized by the Secretary of War. It is alleged that the withdrawal of more, viz., from 400,000 to 600,000 cubic feet per minute, has lowered and will lower the level of the water of Lake Michigan, Lake Huron, Lake St. Clair, Lake Erie, Lake Ontario, Sault Ste. Marie, St. Mary's River, St. Clair River, Detroit River, Niagara River, St. Lawrence River, and all the harbors, &c., connected therewith, all of which are alleged to be navigable waters of the United States, and will thus create an obstruction to the navigable capacity of said waters; and that it will alter and modify the condition and capacity of the above named and their ports, &c., connected with them. The prohibition of such alterations and obstructions in the Act of March 3,

1899, c. 425, § 10; 30 Stat. 1121, 1151, is set out at length and relied upon but the frame of the bill does not exclude a reliance upon more general principles if they were needed in order to maintain it.

The withdrawal practised and threatened is through an artificial channel that takes the place of the Chicago River, formerly a little stream flowing into Lake Michigan, and of a part of its branches. The channel instead of adding water to the Lake has been given an opposite incline, takes its waters from the Lake, flows into the Desplaines River, which empties into the Illinois River, which in its turn empties into the Mississippi. The channel is at least twenty-five feet deep and at least one hundred and sixty-two feet wide; and while its interest to the defendant is primarily as a means to dispose of the sewage of Chicago, *Missouri* v. *Illinois*, 200 U. S. 496, it has been an object of attention to the United States as opening water communication between the Great Lakes and the Mississippi and the Gulf.

The answer shows that the defendant is proceeding under a state act of May 29, 1889, by which it was provided that a channel should be made of size sufficient to take care of the sewage and drainage of Chicago as the increase of population might require, with a capacity to maintain an ultimate flow of not less than 600,000 cubic feet of water per minute, and a continuous flow of not less than 20,000 cubic feet for each 100,000 of the population within the sanitary district. It denies that the defendant has abstracted from 400,000 to 600,000 feet per minute, but as it alleges the great evils that would ensue if the flow were limited to the amount fixed by the Secretary of War or to any amount materially less than that required by the state act of May 29, 1889, and as it admits present conditions to be good, the denial cannot be taken very seriously. The act sufficiently indicates what the State threatens and intends to do unless

stopped. The answer also denies that the abstraction of water substantially in excess of 250,000 cubic feet per minute will lower the levels of the Lakes and Rivers concerned or create an obstruction to the navigable capacity of those waters. It goes into the details of the construction of the channel; the expenses incurred; and the importance of it to the health of the inhabitants of Chicago, both for the removal of their sewage and avoiding the infection of their source of drinking water in Lake Michigan which had been a serious evil before. It shows the value of the channel for the great scheme of navigation that we have mentioned; recites acts of Congress and of officers of the United States alleged to authorize what has been done, and to estop the United States from its present course, and finally takes the bull by the horns and denies the right of the United States to determine the amount of water that should flow through the channel or the manner of the flow.

This brief summary of the pleadings is enough to show the gravity and importance of the case. It concerns the expenditure of great sums and the welfare of millions of men. But cost and importance, while they add to the solemnity of our duty, do not increase the difficulty of decision except as they induce argument upon matters that with less mighty interests no one would venture to dispute. The law is clear, and when it is known the material facts are few.

This is not a controversy between equals. The United States is asserting its sovereign power to regulate commerce and to control the navigable waters within its jurisdiction. It has a standing in this suit not only to remove obstruction to interstate and foreign commerce, the main ground, which we will deal with last, but also to carry out treaty obligations to a foreign power bordering upon some of the Lakes concerned, and, it may be, also on the footing of an ultimate sovereign interest in the Lakes.

The Attorney General by virtue of his office may bring this proceeding and no statute is necessary to authorize the suit. *United States* v. *San Jacinto Tin Co.*, 125 U. S. 273. With regard to the second ground, the Treaty of January 11, 1909, with Great Britain, expressly provides against uses 'affecting the natural level or flow of boundary waters' without the authority of the United States or the Dominion of Canada within their respective jurisdictions and the approval of the International Joint Commission agreed upon therein. As to its ultimate interest in the Lakes the reasons seem to be stronger than those that have established a similar standing for a State, as the interests of the nation are more important than those of any State. *In re Debs*, 158 U. S. 564, 584, 585, 599. *Georgia* v. *Tennessee Copper Co.*, 206 U. S. 230. *Hudson County Water Co.* v. *McCarter*, 209 U. S. 349, 355. *Marshall Dental Manufacturing Co.* v. *Iowa*, 226 U. S. 460, 462.

The main ground is the authority of the United States to remove obstructions to interstate and foreign commerce. There is no question that this power is superior to that of the States to provide for the welfare or necessities of their inhabitants. In matters where the States may act the action of Congress overrides what they have done. *Monongahela Bridge Co.* v. *United States*, 216 U. S. 177. *Second Employers' Liability Cases*, 223 U. S. 1, 53. But in matters where the national importance is imminent and direct even where Congress has been silent the States may not act at all. *Kansas City Southern Ry. Co.* v. *Kaw Valley Drainage District*, 233 U. S. 75, 79. Evidence is sufficient, if evidence is necessary, to show that a withdrawal of water on the scale directed by the statute of Illinois threatens and will affect the level of the Lakes, and that is a matter which cannot be done without the consent of the United States, even were there no international covenant in the case.

But the defendant says that the United States has given its assent to all that has been done and that it is estopped to take the position that it now takes. A State cannot estop itself by grant or contract from the exercise of the police power. *Texas & New Orleans R. R. Co.* v. *Miller*, 221 U. S. 408, 414. *Atlantic Coast Line R. R. Co.* v. *Goldsboro*, 232 U. S. 548, 558. *Denver & Rio Grande R. R. Co.* v. *Denver*, 250 U. S. 241, 244. It would seem a strong thing to say that the United States is subject to narrower restrictions in matters of national and international concern. At least it is true that no such result would be reached if a strict construction of the Government's act would avoid it. This statement was made and illustrated in a case where it was held that an order of the Secretary of War under the Act of March 3, 1899, c. 425, the same act in question here, directing an alteration in a bridge must be obeyed, and obeyed without compensation, although the bridge had been built in strict accord with an act of Congress declaring that if so built it should be a lawful structure. *Louisville Bridge Co.* v. *United States*, 242 U. S. 409, 417. *Greenleaf Johnson Lumber Co.* v. *Garrison*, 237 U. S. 251. It only remains to consider what the United States has done. And it will be as well to bear in mind when considering it that this suit is not for the purpose of doing away with the channel, which the United States, we have no doubt, would be most unwilling to see closed, but solely for the purpose of limiting the amount of water to be taken through it from Lake Michigan.

The defendant in the first place refers to two acts of Congress: one of March 30, 1822, 3 Stat. 659, which became ineffectual because its conditions were not complied with, and another of March 2, 1827, c. 51, 4 Stat. 234, referred to, whether hastily or not, in *Missouri* v. *Illinois*, 200 U. S. 496, 526, as an act in pursuance of which Illinois brought Chicago into the Mississippi watershed. The

act granted land to Illinois in aid of a canal to be opened by the State for the purpose of uniting the waters of the Illinois River with those of Lake Michigan, but if it has any bearing on the present case it certainly vested no irrevocable discretion in the State with regard to the amount of water to be withdrawn from the Lake. It said nothing on that subject. We repeat that we assume that the United States desires to see the canal maintained and therefore pass by as immaterial all evidence of its having fostered the work. Even if it had approved the very size and shape of the channel by act of Congress it would not have compromised its right to control the amount of water to be drawn from Lake Michigan. It seems that a less amount than now passes through the canal would suffice for the connection which the United States has wished to establish and maintain.

In an appropriation Act of March 3, 1899, c. 425, § 10; 30 Stat. 1121, 1151; Congress provided "That the creation of any obstruction not affirmatively authorized by Congress, to the navigable capacity of any of the waters of the United States is hereby prohibited; . . . and it shall not be lawful to excavate or fill, or in any manner to alter or modify the course, location, condition, or capacity of, any port, roadstead, haven, harbor, canal, lake, harbor of refuge, or inclosure within the limits of any breakwater, or of the channel of any navigable water of the United States, unless the work has been recommended by the Chief of Engineers and authorized by the Secretary of War prior to beginning the same." By § 12 violation of the law is made a misdemeanor and punished, and the removal of prohibited structures may be enforced by injunction of the proper Court of the United States in a suit under the direction of the Attorney General. This statute repeatedly has been held to be constitutional in respect of the power given to the Secretary of War. *Louisville Bridge Co.* v. *United States*, 242 U. S.

409, 424. It is a broad expression of policy in unmistakable terms, advancing upon an earlier Act of September 19, 1890, c. 907, § 10; 26 Stat. 426, 454, which forbade obstruction to navigable capacity "not affirmatively authorized by law," and which had been held satisfied with regard to a boom across a river by authority from a State. *United States* v. *Bellingham Bay Boom Co.*, 176 U. S. 211. There is neither reason nor opportunity for a construction that would not cover the present case. As now applied it concerns a change in the condition of the Lakes and the Chicago River, admitted to be navigable, and, if that be necessary, an obstruction to their navigable capacity, *United States* v. *Rio Grande Dam & Irrigation Co.*, 174 U. S. 690, without regard to remote questions of policy. It is applied prospectively to the water henceforth to be withdrawn. This withdrawal is prohibited by Congress, except so far as it may be authorized by the Secretary of War.

After this statute was passed the Secretary of War granted various permits, which are relied on by the appellant although in their nature they all were revocable licenses. On May 8, 1899, the Secretary, on application of the appellant, granted permission to open the channel, assumed in the recitals to have a flowage capacity of 300,000 cubic feet per minute with a velocity of one and one-quarter miles an hour, on the conditions that the permit should be subject to the action of Congress (which was superfluous except as a warning); that if at any time the current created proved to be unreasonably obstructive to navigation or injurious to property he reserved the right to close or modify the discharge; and that the Sanitary District must assume all responsibility for damages to property and navigation interests by reason of the introduction of a current in Chicago River. On July 11, 1900, improvements of the Chicago River were permitted with the statement that the permission did not affect the

right of the Secretary to revoke the permit of May 8, 1899. On April 9, 1901, the Secretary, Mr. Root, directed the Sanitary District to cut down the discharge to 200,000 cubic feet per minute. On July 23, 1901, at the appellant's request, he amended the order to permit a flow of 300,000 feet between 4 p. m. and twelve, midnight, subject to revocation. On December 5, 1901, again on the application of the appellant, leave was given to discharge not exceeding 250,000 feet per minute during the whole twenty-four hours, but subject to such modification as the Secretary might think that the public interests required. On January 17, 1903, the allowance was increased to 350,000 feet until March 31, 1903, after which date it was to be reduced again to 250,000 feet all subject to modification as before. On September 11, 1907, and on June 30, 1910, permissions were granted to make another connection with Lake Michigan and to open a channel through Calumet River (this last refused by Mr. Secretary Taft on March 14, 1907) on the understanding that the total quantity of water withdrawn from the Lake should not exceed that already authorized by the Secretary of War. Finally on February 5, 1912, the appellant, setting forth that the population of the Sanitary District exceeded 2,500,000 and was increasing rapidly, and that the only method then available for disposing of the sewage of this population was by diluting it with water flowing from Lake Michigan through the canal, asked permission to withdraw not exceeding 10,000 cubic feet per second, subject to such restrictions and supervision as might seem proper to the Secretary and to revocation by him. On January 8, 1913, Mr. Secretary Stimson carefully reviewed the situation, including the obvious fact that so large a withdrawal would lower the levels of the Lakes and the overwhelming evidence that it would affect navigation, and held that he was not warranted in excepting the appellant from the prohibition of

Congress on the ground of even pressing sanitary needs. It appears to us that the attempt to found a defence upon the foregoing licenses is too futile to need reply.

States bordering on the Mississippi allowed to file briefs as *amici curiae* suggest that they were not heard and that rights have not been represented before the Secretary of War. The City of Chicago makes a similar complaint and argues that it is threatened with the loss of a hundred million dollars. The interest that the River States have in increasing the artificial flow from Lake Michigan is not a right, but merely a consideration that they may address to Congress, if they see fit, to induce a modification of the law that now forbids that increase unless approved as prescribed. The investment of property in the canal and the accompanying works took the risk that Congress might render it valueless by the exercise of paramount powers. It took the risk without even taking the precaution of making it as sure as possible what Congress might do. But we repeat that the Secretary by his action took no rights of any kind. He simply refused an application of the Sanitary Board to remove a prohibition that Congress imposed. It is doubtful at least whether the Secretary was authorized to consider the remote interests of the Mississippi States or the sanitary needs of Chicago. All interests seem in fact to have been copiously represented but he certainly was not bound to give them a hearing upon the application upon which he was requested to pass.

After the refusal, in January, 1913, to allow an increase of flow, the appellant was notified by direction of the War Department that it was drawing more water than was allowed and was violating § 10 of the Act of March 3, 1899. In reply it intimated that it was bound by the state law to which we have referred and in obedience to it had been flowing 20,000 cubic feet per minute for each

100,000 of population and could not reduce that flow. It suggested that its rights should be determined by a suit, and accordingly this bill was filed on October 6, 1913. An earlier suit had been brought on March 23, 1908, to prevent the construction of a second channel from Lake Michigan through the Calumet River to the appellant's main channel, leave to do which had been refused as we have seen by Mr. Secretary Taft. (The permit subsequently granted on June 30, 1910, was with the understanding that it should not affect or be used in the 'friendly suit' then pending to determine rights.) The earlier suit was consolidated with the later present one, and it was agreed that the evidence taken in that should be used in this, so far as applicable. There was some delay in concluding the case, which the defendant naturally would desire, but after it was submitted to the Judge according to his own statement he kept it about six years before delivering an oral opinion in favor of the Government on June 19, 1920. No valid excuse was offered for the delay. There was a motion for reconsideration, but the Judge took no further action of any kind until he resigned in 1922. On June 18, 1923, another Judge entered a decree for an injunction as prayed, with a stay of six months to enable the defendant to present the record to this Court.

The parties have come to this Court for the law, and we have no doubt that as the law stands the injunction prayed for must be granted. As we have indicated, a large part of the evidence is irrelevant and immaterial to the issues that we have to decide. Probably the dangers to which the City of Chicago will be subjected if the decree is carried out are exaggerated, but in any event we are not at liberty to consider them here as against the edict of a paramount power. The decree for an injunction as prayed is affirmed, to go into effect in sixty days—without prejudice to any permit that may be issued by the Secretary of War according to law.

Affirmed.
